50TH CONGRESS, 1st Session. } HOUSE OF REPRESENTATIVES. { Ex. DOC. 6, Part 2.

TREASURY DEPARTMENT.

COMMERCE OF THE MISSISSIPPI AND OHIO RIVERS.

REPORT

ON THE

INTERNAL COMMERCE

OF THE

UNITED STATES

BY

WM. F. SWITZLER,
CHIEF OF THE BUREAU OF STATISTICS, TREASURY DEPARTMENT.

SUBMITTED JANUARY 30, 1888.

PART II OF COMMERCE AND NAVIGATION.

SPECIAL REPORT ON THE COMMERCE OF THE MISSISSIPPI, OHIO, AND OTHER RIVERS, AND OF THE BRIDGES WHICH CROSS THEM.

WASHINGTON:
GOVERNMENT PRINTING OFFICE.
1888.

TREASURY DEPARTMENT,
Document No. 1039*b*.
Bureau of Statistics.

CONTENTS.

	Page.
Letter to the Secretary of the Treasury transmitting the report	3
INTRODUCTION:	
Value of the Mississippi River system in the regulation of railroad transportation	5
States and Territories embraced within this system	5
The Mississippi Valley: Its area, population in 1880, density per square mile, and rainfall	7
PRODUCTIONS:	
Live-stock, number and value of, and percentage of increase	8
Hogs, number and value of, packed	9
Agricultural, dairy, and miscellaneous products	9
Manufactures, mining, and coal production	10

PART I.

COMMERCE OF THE MISSISSIPPI RIVER, AND OF THE BRIDGES WHICH CROSS IT, FROM SAINT PAUL TO SAINT LOUIS.

Number and tonnage of each kind of craft passing up and down the river and kinds of freight carried	15, 16
Kinds and quantities of freight floated down the river by rafts, and in other ways than permanent boats or vessels	16
Freight moved on the river in each direction, source of, and points to which distributed, and the proportionate amounts transported from and distributed to each point	16
The growth or decrease of the river traffic during the last ten years	17
The influence which the river has exerted on freight rates from the West to the East across the river, or to seaboard and European markets, and its future prospects and influence as a highway for traffic	17
The amount of money expended by the United States Government on the improvement of the river between Saint Paul and Saint Louis	18
BRIDGES ACROSS THE MISSISSIPPI RIVER, DESCRIPTION OF:	
Hastings Railway Draw-bridge	19
Winona and La Crosse Railway Bridges	19
Prairie du Chien Railway Pontoon Bridge	20
Dubuque Railway Draw-bridge	20
Sabula Railway Draw-bridge	21
Clinton Railway Draw-bridge	21
New Rock Island Bridge	22
Burlington Railway Draw-Bridge	23
Fort Madison Railway Draw-bridge	23
Keithsburgh Railway Draw-bridge	23

Page.

BRIDGES ACROSS THE MISSISSIPPI RIVER, DESCRIPTION OF—Continued.
Keokuk Railway and Highway Draw-bridge 23
Quincy Railway Draw-bridge 24
Hannibal Railway and Highway Draw-bridge 24
Louisiana Railway Bridge 24
Dubuque Highway Bridge 25
Cost of the bridges 25
Number of cars (passenger and freight) which crossed each bridge during the year, and quantity and value of freight carried 26
Early history of navigation on the Mississippi 28

SUPPLEMENT TO PART I.

Cities and towns between Saint Paul and Saint Louis; Reasons why not reported 30
SAINT PAUL:
River freight between Saint Louis and trade and commerce, 1887 31
Area and productions of the Saint Paul Belt 31
Railroad construction in 1887 32
Manufactures and wholesale trade 33
Banks, real estate, and population 34
MINNEAPOLIS:
Trade and commerce for 1887; Railroad mileage 34
Manufactures of flour, lumber, agricultural implements, etc. 35–36
Volume of trade, banks, and population 37

PART II.

COMMERCE OF THE MISSISSIPPI RIVER FROM SAINT LOUIS TO MEMPHIS, AND OF THE BRIDGE AT SAINT LOUIS.

The skiff, row-boat, and barge, and buccaneers or river pirates 39
Founding of Saint Louis 40
Western navigation 40
The Saint Louis Bridge 41
Material and cost 45
Number of railroad passengers crossing the bridge and number of freight and passenger cars from 1876 to 1887, inclusive 46
Saint Louis Bridge business 48
SAINT LOUIS:
Population 1799 to 1886 52
Commerce of, towards the south 54
Railroad possibilities as a trade center 55
Arrivals and departures of steam-boats and barges, 1887 57
Tons of freight received and shipped, 1871 to 1887 58
River tonnage, by months, 1886 and 1887 59
Comparative business, 1884 to 1887 61
Shipments and river conditions 65
Highest and lowest stages of water, by months, 1886 and 1887 67
Arrivals and departures for twenty-two years 68
Shipments by New Orleans boats, 1880 to 1887 68
Shipments by Memphis and Vicksburg boats, 1880 to 1887 69

LETTER OF TRANSMITTAL.

TREASURY DEPARTMENT,
BUREAU OF STATISTICS,
January 30, 1888.

SIR: I have the honor to transmit herewith a special report in regard to the inception, development, and present condition of the commerce of the Mississippi and Ohio Rivers, and of the bridges which cross them. The information embodied in the report was collected and prepared by experts appointed by you for that purpose, who discharged the duties assigned them under instructions issued by this Bureau; and they have succeeded in the midst of many difficulties in presenting much valuable historical, statistical, and other information which cannot fail to interest every citizen who gives attention to our great natural water-ways, embraced in what is popularly known as the Mississippi River System.

Respectfully yours,

Wm. F. Switzler.

Chief of Bureau.

Hon. C. S. FAIRCHILD,
Secretary of the Treasury.

THE COMMERCE OF THE MISSISSIPPI AND OHIO RIVERS.

INTRODUCTION.

Our great natural water-ways, which are embraced by what is known as the Mississippi River system, ought not for any reason to be undervalued or neglected, and especially for the reason that they cost us nothing.

The Mississippi River is the backbone of this system, and now is and will forever remain not only an important factor in the regulation of railroad transportation in the United States, but during the months of each year favorable to the use of its rivers, valuable aids to a commerce worthy of the fostering care of Government and people.

But for that river and its navigable tributaries and the large lakes on our Northern boarder the transportation of the United States between points inland and from these to the sea-board would be largely controlled by lines of railroad which are exclusively the property of corporations, some of which are the most colossal known to the country. It is easy to see, therefore, that but for the influence which these water-ways, under favorable conditions, are able to exert in the regulation of internal transportation, the interests of the people in respect to this subject would be almost exclusively within the iron grasp of the corporations named.

The whole number of square miles in the United States is 3,025,502. The Mississippi River system embraces an area of 1,238,642 square miles, or 41 per cent. of the total.

The numerous and outstretching arms of this system embrace wholly or in part Alabama, Arkansas, Dakota, Illinois, Indiana, Indian Territory, Iowa, Kansas, Kentucky, Louisiana, Minnesota, Mississippi, Missouri, Montana, Nebraska, Ohio, Pennsylvania, Tennessee, Texas, West Virginia, and Wisconsin—eighteen States and three Territories. Its navigable streams number forty-five, and furnish the people more than 16,000 miles of river navigation—a line more than four times the length of the ocean line from New York to Liverpool and more than four times the distance by rail across the continent from New York to San Francisco.

In the review of the Mississippi River and its tributaries, prepared for this Bureau by Mr. Alexander D. Anderson (and which can be found in the general apendix), very interesting statistics are employed to show that the people of the United States possess in the Mississsippi and its forty-four navigable tributaries highways of commerce and cheap transportation to the sea-board of the commercial value of $2,000,000,000,000. That is to say, lines of railroad of equal length and tonnage with said river and its tributaries, if constructed at the usual expense of such improvements, would cost the people of the United States this enormous and almost incomprehensible sum.

When it is remembered that these great water-ways, capable of bearing to the markets of the country and from thence to foreign ports the tonnage indicated, are free gifts of nature, an unanswerable argument is furnished in support of a liberal policy towards them.

No one, therefore, will question that a special report, which faithfully records the history of the inception and development and discusses the present condition and points to the attainable possibilities of the commerce of the Mississippi River system and of the numerous bridges which cross its arteries, is justified by high considerations of public policy.

It is not the function of the Bureau of Statistics to enter the field of partisan discussion in respect to any of the economic or other issues which divide political parties. Since, however, the improvement of our rivers is not a party question, it can not be a transgression of this well-established policy if the conviction be expressed that, on account of their value to the people who now inhabit the United States and of the generations who will in the future occupy its territory and control its destinies, it is the duty of Congress not to undervalue or neglect the great natural highways of the nation.

Nor is it believed to be a transgression of the line of duty which this Bureau, under its present control, has seen proper to pursue, that special attention be directed to the historical and statistical information which this report furnishes, tending to impress the country with a proper conception of the value to us and to our posterity forever of the rich heritage which wise statesmen of an early period in our history secured almost without money and without price.

The tables which follow very clearly bring to view the area in square miles covered by the Mississippi River system and its population, together with its agricultural, mineral, and other resources, according to the census of 1880, from which it will be seen that extensive as our territory now is, the Mississippi Valley, as it may be defined by the rivers which drain it and whose common outflow is the Gulf of Mexico, embraces 41 per cent. of the area of our entire territory (only 9 per cent. below one-half) and 43 per cent. of our total population.

It will not be questioned that if these calculations were based upon the present population of this area the percentage would be largely increased.

The march of empire is rapidly tending from the Atlantic slope westward to the Mississippi Valley, the geographical center of the Republic; for, as is well known, the center of gravity of the nation's population is now near the east bank of the Mississippi River, and in a short time will be transferred to its west bank.

These and similar considerations have stimulated frequent inquiries of this Bureau for information in respect to the history, present condition, and future commercial possibilities of the people who inhabit this great valley, and justify collecting materials for and publishing a special report on the subject.

Wide as the field of inquiry is and difficult and almost insurmountable as the obstacles are which stand in the way of full and accurate information, it may be justly claimed that the report now submitted is reasonably exhaustive of the subject in its historical and statistical relations to the people, and as affording, in well-arranged and intelligible form, much valuable information that is new, and also some, it is true, which has at different times appeared in fragmentary form in newspaper articles, pamphlets, books, and reports.

Nevertheless, it is not too much to claim that this report is a collation of the most reliable information attainable, old and new, on a subject of importance to the country, in the light of which intelligent discussion of the problems concerning the Mississippi River system can be conducted in Congress and elsewhere and a wise policy evolved therefrom.

THE MISSISSIPPI VALLEY IN 1880.

On page —— of Mr. Anderson's "Review" (see Appendix) there is a table of percentages some of the items of which differ from those found in the tables following. These apparent discrepancies, when found to exist, grow out of the fact that Mr. Anderson's calculations are based on a larger geographical area for the Mississippi Valley than that accepted as such in the statistics which follow. Both enumerations are correct, and differ only because made in some instances from different points of observation:

Basin of the—	Area.	Population.	Density per square mile.	Rainfall.
	Sq. miles.			*Inch.*
Upper Mississippi	167,635	5,266,653	30.0	34

Swine	33, 129, 992	154, 710, 965
Total	70, 349, 823	885, 953, 930
United States	140, 972, 673	1, 525, 276, 457

HOGS PACKED IN MISSISSIPPI VALLEY.

	Hogs.	Value.
Mississippi Valley	5,263,037	$82,102,377
United States	14,896,295	275,123,500

The hogs slaughtered in Chicago, however, should be included in the product of the Mississippi Valley, as all, or nearly all, of them come from the Valley States. This would make the number of hogs packed annually in the Valley 9,443,774, of the value of $155,425,360, or 56 per cent. of the production of the entire country.

AGRICULTURAL PRODUCTION OF THE MISSISSIPPI VALLEY.

The following table gives the entire agricultural production of the Mississippi Valley, and enables the reader to form an idea of the trade that the Mississippi River and its tributaries, and the railroads dependent on them, should enjoy and will enjoy at no distant day:

	Products.	Value.
Cotton ... bales	2,425,170	$107,050,000
Wheat ... bushels	293,799,000	289,441,000

Mr. Andrew Carnegie, in his very valuable book entitled Triumphant Democracy, or Fifty Years' March of the Republic, says:

Nature has done much for America as regards facilities for transportation. Her inland seas, containing one-third of all the fresh water in the world, and her great rivers lie ready at hand awaiting only the application of steam to vessels to render them magnificent highways. A vessel sailing round the edges of these American lakes traverses a greater distance than from New York to Liverpool.

The rivers of America are also the largest in the world. After the Amazon and the La Plata comes the Mississippi, with an outflow of over 2,000,000 cubic feet per hour. This mighty river, which the Indians called in their picturesque language Father of

Waters, is equal in bulk to all the rivers of Europe combined, exclusive of the Volga. It is equal to three Ganges, nine Rhones, twenty-seven Seines, or eighty Tibers. "The mighty Tiber chafing with its flood," says the master. How would he have described the Mississippi on the rampage after a spring flood, when it pours down its mighty volume of water and overflows the adjacent lowlands? Eighty Tibers in one! Burns's picture of the pretty little Ayr in flood has been extolled, where the foaming waters came down "an acre braid." What think you of a tumbling sea 20 miles "braid" instead of your "acre," dear Robin? The length of the Mississippi is 2,250 miles, while its navigable tributaries exceed 20,000 miles.* The Father of Waters collects his substance from water-sheds covering an area of more than 2,500,000 sqare miles.*

"The Hudson is navigable by large steamers as far as Albany, 150 miles inland from the Atlantic. There are quite a dozen other rivers in which the like is possible. Many well-known sea-ports are considerable distances from the coast, properly speaking. Such are Philadelphia, Baltimore, New Orleans, and (on the Pacific coast) Portland. The presence of inland ports, with extensive docks, piers, and large craft, is a constant source of astonishment to the European traveler. The sight of ships of 3,000 tons burden 1,500 miles from salt water is sufficient to surprise one in whom the sight of rigged ships has always been associated with the sea. Walking along the quays of the lake cities—Buffalo, Toledo, Chicago, or Duluth—one might well imagine himself at the sea-coast.

"These great natural water-ways have been supplemented, and connected with each other by artificial canals. There were in the United States in 1880, 4,468 miles of canals, which had cost $265,000,000 (£53,000,000). Nearly 2,000 miles of canal had, however, been abandoned, having been rendered valueless by the superior facilities offered by railroads. Many of the canals still worked were reported not to be paying expenses, and part of these also will no doubt soon be abandoned. The freight traffic on canals in 1880 amounted to 21,044,292 tons, yielding a gross income of $45,000,000 (£9,000,000).

"The early history of navigation in America presents as many curious contrasts and interesting facts as do other divisions of the history of American progress. From the beginnings which to us seem ludicrously small and crude, the greatest results have come. At the beginning of the century a successful steam-boat had not been built. For twenty or thirty years inventors in France, Scotland, England, and America had been working and planning to apply a principle which they saw was perfectly applicable; but lacking knowledge of one or two little essentials, they only passed from failure to failure, yet constantly getting nearer and nearer to success. John Fitch and Oliver Evans are the names of the earliest representatives of America in this great struggle.

"After each experimenter had contributed some new light, an American engineer, Robert Fulton by name, gathered, in 1807, the multiplicity of lights into one great flame, and made practicable by the help of all what each had tried in vain to achieve by himself. Fulton's *Clermont* was the first commercially successful steam-boat ever built. A boat of 160 tons burden, she was launched on the Hudson in 1807, and ran over a year as a passenger boat between New York and Albany. The first steam-boat of the Mississippi Valley was built by Fulton in 1811, and was called the *Orleans*. She had a stern wheel, and went from Pittsburgh to New Orleans, more than 2,000 miles, in fourteen days. The next year Henry Bell, of Scotland, built the *Comet*, of 30 tons, which plied between Glasgow and Greenoch, and in 1813 sailed around the coasts of the British Isles. In 1819 the *Savannah*, 380 tons burden, crossed the Atlantic from America, visited Liverpool, St. Petersburg, and Copenhagen, and returned. Nineteen years later, the *Great Western*, 1,340 tons, and the *Sirius* steamed across the Atlantic from England, and only two years afterwards, namely, 1840, the present justly celebrated Cunard Line was established, inaugurating an era of ocean

* This estimate exceeds the figures presented in another portion of this report.

travel which has revolutionized human life, and brought the Old and New Worlds within six days of each other. * * *

"The traffic floated upon these Western rivers will surprise many. Take the Ohio, for instance; a competent authority has stated that the total of its trade from its head at Pittsburgh to its mouth at New Cairo, about 1,000 miles, exceeded in 1874 $800,000,000, or £160,000,000, a sum greater than the total exports of the nation about which we hear so much. It is upon the Ohio that the cheapest transportation in the world exists. Coal, coke, and other bulky articles are transported at the rate of one-twentieth of a cent, one-fortieth of a penny, per ton per mile. This is made possible by means of barges, many of which are lashed together and pushed ahead by a steam-tug. The current, of course, carries along the floating mass. The steamer has little to do but to guide while descending and to tow the empty barges back. The records of 1884 show that there were owned in the one city of Pittsburgh for use on the river 4,323 vessels, including barges, with a tonnage of 1,700,000 tons. One hundred and sixty-three of these were steam-boats. Twenty thousand miles of navigable waterways lie before these Pittsburgh craft, and many thousand miles more are ready to be opened by easily-constructed improvements in the lesser streams. This work the General Government is steadily performing year after year, as well as improving the existing navigation. Even to-day, a boat can start from Pittsburgh for a port 4,300 miles distant, as far as from New York to Queenstown and half way back, or as far away as the Baltic ports are from New York."

APPENDIX.

THE COMMERCE OF THE MISSISSIPPI AND OHIO RIVERS AND OF THE BRIDGES WHICH CROSS THEM.

1887.

PART I.

COMMERCE OF THE MISSISSIPPI RIVER FROM SAINT PAUL TO SAINT LOUIS.

By Frank Johnson, *Clinton, Iowa.*

The number and tonnage of each kind of craft passing up and down the river separately, and the number of the repeated trips of the craft of each kind.

As taken from the books of the supervising inspectors of steam-vessels at Galena, Ill., and Saint Paul, Minn., and the harbor and wharf master at Saint Louis, Mo., I find that in the year 1886 there were plying the Upper Mississippi and tributaries 138 boats carrying passenger license, with an aggregate tonnage of 17,144.45; 66 tow-boats, with a tonnage of 4,894.32; 24 ferry-boats crossing the river at various points, having a tonnage of 1,992.54; and 8 pleasure yachts, with an estimated tonnage of 16; 2 packets on Illinois River, with aggregate tonnage of 514; 100 barges towed in Mississippi during year 1886 with average tonnage of 174.15, or total of 17,415; and 63 barges in Illinois River, with average of 152.35 each, or total of 9,598—making a grand total of all classes of tonnage during the year of 51,574.31 used for transportation purposes in this great water way furnished by nature, owned by no company, and any man or association of men can transverse it from end to end with freight and passenger bearing craft and charge as much or little for it as they please.

Three packets of Diamond Jo Line of steamers, running through from Saint Louis, Mo., to Saint Paul, Minn., averaged 18 trips each during the season of 1886; one of same line running between Saint Louis, Mo., and Keokuk, Iowa, made 50 round trips. Three of the Saint Louis and Saint Paul Line, plying between points named, averaged 9 trips each. The latter were all large side-wheel boats and could only run during high water. One of the same line between Saint Louis and Keokuk made 73 trips. Two boats on Illinois River made 47 trips each during the season.

It is impossible to get at the exact number of each kind of craft, as in most instances no record is available; and where time cards were arranged for through boats the compliance with them was so irregular that no reliable data can be ascertained from which to deduce an authoritative statement. I have therefore taken as an approximation of trips by all classes of crafts on various parts of the river the record kept of steam-boats and barges that passed the draw at the following bridges during the year:

	Steam-boats.	Barges.
Winona, Minn	4,570	974
Clinton, Iowa	2,993	923
Louisiana, Mo	1,082	463

The above three points represent the extreme north, extreme south, and midway (or practically so) crossings between Saint Louis and Saint Paul, and from the figures above given an estimate can be made of the repeated trips with as great a degree of reliability as any that it would be possible for me to attempt.

The discrepancy appearing in the number of passages between the extreme north and extreme south points, or, in other words, at Winona, Minn., and Louisiana, Mo., is explained by the fact that a great majority of the boats used exclusively for towing logs ply north of the latter place and but a very limited number of such craft pass the bridge at that point. The boats passing at Louisiana are almost invariably through passenger and freight boats to and from the port of Saint Louis, as are the barges also that they have in tow, loaded with miscellaneous freight each way.

Total number steam-boats, all classes	238
Total number barges in Mississippi	100
Total number barges in Illinois	63
Total tonnage of boats	24,561.31
Total tonnage of barges	27,013.00
Grand total tonnage	51,574.31

So far as practicable, the kinds of freight carried down and up the river, separately, and the tonnage and value of each kind of freight.

The principal kinds of freight carried down the river are oats, wheat, corn, barley, pork, lard, butter, lumber, horses and cattle, flour, green hides, and lead. Up-the-river merchandise, including "iron, nails, glass, oils, paints, cordage," wagons and agricultural implements, salt, cement, staves, horses, cattle, coal, and many other miscellaneous articles impossible to enumerate. The principal steam-boat lines on the Upper Mississippi are the Saint Louis and Saint Paul Packet Company, the Diamond Jo Line, and the Eagle Packet Company. There are also many independent boats carrying freight and passengers. During 1886 the amount of freight carried was 337,713 tons, and passengers, 965,083.

There is no record attainable by which I can arrive at the value of each kind of freight carried. Add to the above the amount carried by independent boats, barges, etc., and from the most reliable information that I can obtain the amount of miscellaneous freight moved by the boats during the year 1886 was 437,713 tons, and while this is less than the amount carried in former years, the decrease is not any indication of a lessening of the importance of the Mississippi River as a transportation route, as will be practically shown ere the conclusion of this report.

During the season of 1887 the Diamond Jo Line of steamers carried 259,354,078 pounds of freight between Saint Louis and Saint Paul.

Similar information in regard to the freight floated down the river by rafts and in other ways than in permanent boats or vessels.

From statistics collected by A. Mackenzie, major of engineers, United States, at Rock Island, Ill., which can be considered as reliable as it is possible to secure on this question of paramount importance to all others, regarding the value of the Mississippi as a transportation route, I find from his figures that there were floated in the river for various distances, in 1886, 781,720,120 feet, board measure, logs, and 533,400,000 feet, board measure, lumber; total, 1,315,120,020 feet. Of the lumber 218,800,000 feet came from the Chippewa, 80,000,000 from the Saint Croix, and 92,500,000 from the Black. The total product, if shipped by rail, would load 108,760 cars of 12,000 feet each (about 20 tons each), the amount generally accepted by lumbermen as a car-load. Supposing an average length of car 35 feet, it would load a train 721 miles in length, or 5,438 trains of 20 cars each; and the business of 1886 represents nearer the minimum than the maximum, as it was a year of exceedingly low water and many very annoying log jams in the tributaries.

The lumber business is the most important interest on the Upper Mississippi and its tributaries. It gave employment in 1886 to 92 raft boats, valued at $720,000. Between Saint Louis and Saint Paul 74 saw-mills were operated by 67 wholesale lumber firms, having an invested capital of $33,000,000. Their manufacture during the year was—lumber, 934,735,854 feet, B. M.; lath, 267,888,340 pieces; shingles, 274,581,750 pieces. The success of this important trade depends upon the use of the Mississippi River as a line of transportation.

The source of and points to which distributed, so far as practicable, of the freight moved on the river in each direction, and the proportionate amounts transported from each point and distributed to each point of destination.

The principal portion of the freight moved north is through to the important cities and towns that skirt the river bank the entire distance between Saint Louis and Saint

Paul, and it is not an unusual occurrence to have an entire cargo of glass, nails, or iron for wholesale houses located in these places come clear around from Pittsburgh or Wheeling on the Ohio River to the Mississippi, and thence to its destination, thereby saving greatly in cost of freight. Frequently such cargoes are shipped to railroad crossing points and there transshipped to important interior points as a matter of economy, but the exact amount of such freight it is impossible to ascertain, only as it may subsequently appear under the head of "Historical sketch," in which will be grouped statistics of the development, growth, character, etc., of the important cities on the Upper Mississippi.

The growth or decrease of the river traffic as thus divided during the last five or ten years.

I can get no reliable statistical record only for the year 1876. In that year the amount of freight received at the port of Saint Louis from the Upper Mississippi was 224,860 tons, and the shipments from that port 93,360. The estimated total product of white pine, according to the figures of Major Mackenzie, floated into the Mississippi in 1876 is 1,350,000,000 feet, including logs, lumber, shingles, etc. The receipts at Saint Louis from the Upper Mississippi were: lumber, 112,786,133 feet; logs, 8,156,250 feet; shingles, 59,981,000; lath, 15,380,750; pickets, 6,803,000.

While I have no figures for any one given point for the year 1886, I find that the total amount of miscellaneous freights moved by the boats during the year was 437,713 tons, and the number of passengers carried by them same year 965,803. Of lumber, logs, etc., moved by water I find a total of 1,315,120,020. The number of steam-boats that passed the draw of the Davenport and Rock Island Bridge in 1876 was 1,976, and in 1886 there were 2,393, or 417 more boats passing the same point in the latter year than the former, indicating a very perceptible increase in traffic during the decade. While the figures for 1887, although not now attainable, will show a greater increase in the commerce of the river than for many years back, or since the advent of parallel lines of railroad to compete with the great water-way.

This is accounted for by the passage of the interstate-commerce bill, which is forcing large quantities of freight to the river route that formerly sought the rail, and during the present year transportation companies are increasing their facilities, and some of the finest large side-wheel packets that ever floated the Upper Mississippi are now being built on the Ohio to be placed on the northern waters next season by a new company, who will bid loudly for a fair share of the growing traffic in freight and passengers.

Steam-boat men realize the fact that they are hampered by no law in the regulation of their freight tariff, and that no monopoly has exclusive rights on the great river.

As a consequence, the people are receiving the benefits, and each successive year will re-enforce them, until the tranpsortation facilities enjoyed by the millions that inhabit the fertile Mississippi Valley will have no parallel on the American continent.

The past decade up to 1886 shows in all but a slight increase in river traffic, but the next from that year on promises a great increase, and the people are correspondingly happy.

The influence which the river has exerted as a regulator of freight rates on staple commodities moved from the West to the East across the river, or to seaboard and European markets, and the influence which it exerts in any way upon freight rates by rail in any direction; also its future prospects and influence as a highway for traffic.

Railroads now carry the larger portion of the miscellaneous freight which was formerly transported by river; but they are compelled by river competition to carry such freight during the season of navigation at very low rates. The saving to commerce, therefore, resulting from the Mississippi River and its improvements comes from the resulting low rate of freight, and its money value must be calculated not only from freight moved by water, but also freight moved by rail in competition with the water route. Major Mackenzie truthfully says that the effect of the river, if kept in a navigable state, in the saving to commerce, would be the same if not a pound of freight was actually transported on on the Mississippi.

How much the effect would be in cheapening the cost of transportation it is impossible to accurately say, but it is fair to estimate such reduction in cost at about one-third. The railroads competing with the river are obliged during the season of navigation to reduce their freight charges in order to obtain business; but from the time navigation closes in the fall (usually about November 15) until its reopening in the spring (during the month of March) the rates are from two to six times more than during the months boats are running. The average cost of transporting lumber and logs from the tributaries to various points on the Upper Mississippi River was, during 1886, $1 per 1,000 feet, board measure, showing a saving in water transportation of $2 per 1,000. There were moved

by water 1,315,120,020 of logs and lumber, which indicates a saving in this item of $2,630,240 as compared with transportation by rail.

The saving to commerce on the miscellaneous freight actually moved by water in the year 1886 on this upper river is placed approximately at $800,000, which, with the saving on lumber, gives us $3,430,240. This figure, it must be remembered, only represents the saving on freight actually moved by river. The immense additional saving to commerce from low rates on freight moved by rail in competition with the river can not be calculated, but the aggregate must be among the millions.

To quote from a memorial presented to Congress by the Minnesota legislature in 1885, pertaining to the necessity of continuing the improvement of the Mississippi, in order that it may be navigable at all stages of water from Saint Paul to the Gulf:

"These results already attained justify the belief that the well-directed plans of the engineers in charge can secure such a depth of water as will allow wheat to be transported from the Falls of Saint Anthony to the Belize and put on board ships, to be conveyed to Europe, and flour to our South American and Mexican neighbors, at freight charge not to exceed one-third those now paid to reach the markets. Wheat at 8 cents per bushel (freight) on board ship at the Belize means $6,400,000 per year saved to Minnesota on her present production."

There must be added to this the untold millions which would be saved to the productive and rapidly developing States of Wisconsin, Illinois, Iowa, and Missouri that are bounded by that part of the river under consideration, should the improvements spoken of above be carried forward to completion and maintained after completion.

The influence of the river as a highway for traffic and a regulator of rates to the seaboard, in my opinion, is of incalculable benefit to the people that inhabit this fertile valley, and in fact the inhabitants of the entire Northwest, as it stands as a monitor or highway created by nature between the people and extortions that would and are being practiced by railroads where its influences are not felt.

In this alone its value can not be computed in dollars and cents, but is appreciated by every intelligent mind cognizant of the great influence it exerts in the reduction of rail rates in moving the immense products to the seaboard for transshipment to the European markets. The river is, and ever will be, a competitor in this traffic.

It is assumed from the most reliable statistics attainable that 40 per cent. of the eastbound tonnage from Iowa represents the products of the soil, and it would be safe to estimate at least a similar amount from Minnesota, Illinois, and Wisconsin, as these States are mainly agricultural. This percentage represents the surplus or proportion of earnings from which is realized the material prosperity of the people of these States

It is, then, a matter of special interest that the rate paid by this 40 per cent. from the producer to the ultimate market shall be the lowest amount practicable. Whatever causes at home or abroad raise or depress the values of these products, the final and determining price is fixed by the rate at which they are sold in Liverpool and London—the markets of the world. So far as the future seems to promise there is little to encourage the hope of materially higher prices for the surplus represented by this 40 per cent., other than by the continued improvement of this great natural highway of commerce given by an all-wise Creator to the people of this land to utilize in the regulation and cheapening of transportation, so that the farmers, the producers, and the manufacturers can get to the markets of the world with their products at the lowest possible rate.

If, as has often been stated, the tardiness of reaching these markets by the natural water ways is an insurmountable obstacle to their use in this rapid age, it can not be consistently denied that the fact of nature's highway being in readiness at least eight months of navigable season each year will, during this annual period, fix the rates at which the railroads carrying to the same destination must perform the service, and in doing this the route given by nature to the land is of incalculable value, and its possibilities for future use in this direction is beyond the conception of man.

The amount of money, as near as you can ascertain, which has been expended by the United States Government on the improvement of the navigation of the river between Saint Louis and Saint Paul up to the present time.

From figures furnished by Maj. A. Mackenzie, Rock Island, I find that there has been expended for improving the Mississippi River from Saint Paul to Des Moines Rapids by the United States Government up to January 1, 1887, the sum of $1,263,205.02.

Amount expended to same date improving Rock Island Rapids, $1,169,829.07.

Amount expended improving Des Moines Rapids, which includes the construction of the canal, $4,480,879.08.

Making a grand total, including the latter item, of $6,913,913.17 expended by the Government up to January 1, 1887, on the 527 miles of river under consideration.

I have been unable to secure any record of amount expended from Des Moines Rapids to Saint Louis, but it has been very light as compared to the expenditures reported, and

all very meager, when the value of the improvements made are taken into consideration.

Subsequent to writing the above relating to amount expended by the Government on the improvement of the Upper Mississippi between Saint Louis and Saint Paul, I have received the following information from E. A. Ruffner, captain of engineers, at Quincy, Ill., who has charge of the work between Des Moines Rapids and Saint Louis, or rather mouth of the Illinois River. He states:

"Approved plan of operations, consists in contracting the lower water-bed of the river to suitable dimensions at such localities as numerous channels or insufficient depth exists. Island chutes are closed by brush and stone dams, and wing dams of the same construction are built where necessary to guide or contract the channel. The heads of islands, ends of dams, and many caving banks are protected by brush mats and ripraps. Dredging is resorted to, when necessary, and will be, in future, more used during low water, when a hydraulic dredge, which is to be built this winter, is ready for use. New work and repairs to old work are sometimes done by contract and sometimes by hired labor and United States plant. Amount expended to end of last fiscal year, $787,170.94. Amount available for present fiscal year, $150,000." Add amount, as reported by Captain Ruffner, to my former total and we have a grand total expenditure by the United States Government, on the river under consideration, to January 1, 1887, of $7,701,084.11.

BRIDGES.

A brief description of the character of the bridges across the Mississippi River between Saint Paul and Saint Louis and the facilities for traffic across them.

Hastings Railway Draw-bridge.—Commencing on the right bank, the approach is an embankment of 300 feet; then 235 feet of trestle; then a draw span of 300 feet over all—two spans of about 150 feet each and one of 106 feet; then 2,286½ feet of trestling to a bridge of two spans, each 105 feet; then trestle for 700 feet to the embankment. The piers are built of the magnesian limestone found in that vicinity, the most of it from Barn Bluff, at Red Wing, and all rest upon piles sawed off. The draw-span and two adjoining 150-foot spans have iron trusses of the Post pattern. They were built by the American Bridge Company of Chicago, and are of a combination of wood and iron. The draw is worked by men with levers. Opened for railway travel in 1881. The cost of the structure was $60,000. Facilities for traffic good. Built by the Hastings and Dakota Railway Company.

Winona Railway Bridge.—This bridge was built by the Winona and Saint Peter's Railway Company in 1869–'70 and opened for travel in 1871. Commencing on the west bank, the bridge is reached by trestling for about 2,100 feet. The first span is 80 feet from centers. It is a Howe truss. The next going east is the draw-span, which is 360 feet over all, giving clear openings of 160 feet. This span is of iron, and of the Post pattern. The next two spans are each 250 feet from centers, and are Howe trusses. This brings us across the main channel to the low island. From here are seven spans of wood, each 142½ feet in length. The slough is crossed by Howe trusses, four spans of 160 feet each from centers. Then come nine Queen post trusses of about 45 feet in length, each resting on piles; then two trusses of 142½ feet span and one of 45 feet. Then comes an embankment, 2,805 feet; then 75 feet of trestling; then two spans of 132½ feet each, and then 345 feet of trestling across the slough to embankment, making 3,988 feet of bridging, exclusive of the trestle approach on the west bank. The draw is turned by a small steam-engine or by hand. Reported cost, $200,000. Facilities good for traffic.

La Crosse Railway Bridge.—Built by Chicago, Milwaukee and Saint Paul Railway Company in 1875–'76; opened for travel in December, 1876. Commencing at North La Crosse there is an embankment 1,420 feet in length (the Black River); then 600 feet of pile trestle to a pivot-draw span (this span is 310 feet over all); then 1,900 feet of trestling to French's Slough; the bents from French's Slough to the Old Channel, 2,000 feet, there is trestling; of this distance 1,125 feet is on a 2 degrees curve, which ends 50 feet from the pier on the bank of the Old Channel. This old channel is crossed by 5 spans of 148 feet each—total, 740 feet; then 650 feet of trestling across Minnesota Island to the bridge, over what is now the main channel of the river; of this distance 593 feet is on a 5 degrees curve. The main channel is crossed by two spans of 164 feet each, one of 250 feet, and a pivot-draw of 360 feet. This portion of the bridge is on a straight line, which extends 100 feet beyond the right or west abutment; then comes a 6 degrees curve for 534½ feet, and then 4,340 feet tangent, extending to La Crescent Junction; all on the west side of the bridge is trestle. The whole length between main line on east side of river and main line on west side is 13,540 feet. Over the Old Channel there are five spans of iron, built by the American Bridge Company, of Chicago. These spans weigh about 70 tons each. Each of the draw-spans rests upon a pier of three rows of capped piles at right angles with the axis of the bridge. The center pier is of masonry,

resting on piles. The draw-span rests, when open, upon three rows of piles above and below the bridge. Facilities for traffic good. Estimated cost of structure, $300,000.

Prairie du Chien railway pontoon bridge.—This novel structure was built by Mr. John Lauler, of Prairie du Chien, Wis., for use of the Chicago, Milwaukee and Saint Paul Railway, and opened for railway travel between Prairie du Chien, Wis., and North McGregor, Iowa, April 14, 1874. The river here is divided by an interjacent island into two channels, both of which are navigated. The McGregor Channel, so-called, is 1,500 feet wide at a medium stage of water, and the Prairie du Chien channel is 2,000 feet in width. The distance between the Wisconsin and Iowa shores, embracing the island to which reference has been made, is 7,000 feet, which corresponds to the length of the bridge. The structure throughout is of ordinary piling, except across the navigable portions of the channels, which are covered by the pontoon draw. Each of these draws is a single float 30 feet wide at the bottom, 6 feet deep, and 41 feet on deck, and 408 feet in length. The frame and bottom of the draw is of Norway pine, of heavy dimensions, and the deck of white pine. Each draw has five heavy bulkheads running the whole length, which are thoroughly bolted through and through. The track is regulated to the varying stages of the river by a system of blocking confined in a frame and adjusted by means of hydraulic jacks. The range of variation between high and low water at this point is 22 feet. There is used in the construction of each of the draws about 600,000 feet of plank and timber. The draw is operated by a steam-engine of about 20 horse-power, which communicates motion to a pulling chain passing over a drum, and stretching along the bed of the river to suitable points above and below, where it is fastened securely to a dolphin (a clump of piles united together). The pontoon when closed for the passage of trains, is held in position by a T-shaped wrought-iron shaft 5 inches in diameter, which projects above the side of the draw into a timber frame, faced with iron and secured by a pier driven around it. This coupling or fastening is so arranged that it may be instantly attached or detached by a single person. The draw, when in position for the passage of trains, lies across the current of the stream at about a right angle, and when opened for the passage of river craft comes to a rest parallel with the thread of the stream. The time consumed in opening or closing is about three minutes. The ends of each draw are adjustable to the approaches by trusses 30 feet in length, composed of iron and timber, by means of which the track upon the pontoon is securely connected with the permanent track. At each end of the draw sheer-booms rest on piers driven for the purpose, and extend at an easy angle to either shore, by which means the largest rafts are guided through the draw opening without the necessity of uncoupling.

The structure cost $150,000, or one-sixth the estimated cost of an ordinary pivot bridge at the same point, and its facilities for traffic are fully commensurate with every requirement. A bridge of similar style was erected in 1872 across the Mississippi River between Wabasha, Minn., and a point in Wisconsin near the mouth of the Chippewa River; and Congress has authorized the building of others at various places on the Upper Mississippi. Mr. Lauler has had charge of the transit of passenger and freight over the Mississippi at Prairie du Chien for many years for the Chicago, Milwaukee and Saint Paul Railway Company, and he conceived the idea of a pontoon to do the work cheaper and safer than by steam-boat and barges, as before, and it may be truthfully said that he is not only the designer and builder of the pontoon now being adopted for this purpose, but its originator. For more than thirteen years Mr. Lauler has successfully operated his pontoon, and, in the words of a very eminent and practical engineer, if necessity should demand it, by his device it would be practicable, using two pontoons, to open a clear water space of 1,000 feet in a railway pontoon bridge in four minutes of time and restore the same into position in about the same length of time. River men generally speak of the McGregor bridge as presenting by far the least obstruction to navigation of any bridge spanning the river between Saint Louis and Saint Paul, and highly recommend such structure as both economical and practical.

Dubuque railway draw-bridge.—This bridge was built and opened for travel in 1868 by the Dubuque and Dunleith Bridge Company, under act of Congress approved July 25, 1866.

The bridge approach from the Iowa side is over bottom land or trestling for a distance of 2,400 feet. A portion of this distance is on a curve of about 1,400 feet radius. The first pier is placed upon the old level at a point 125 feet back from the usual low-water shore line. The next pier was built in the river upon what at times is a dry sand-bar. The other piers stand in the water. The spans commencing at the Iowa shore are, first, four of 225 feet from centers; then one 250 feet from center; then a draw-span 360 feet over all, with clear openings of 160 feet; then a span of 250 feet, reaching to the Illinois shore. One hundred feet from this abutment is the entrance to a tunnel 835 feet in length. The masonry of the piers rests upon grillages placed upon piles which are sawed off about 10 feet below low water. The superstructure is of iron, built by the Keystone Bridge Company, of Pittsburgh, Pa. All the parts of the draw are of wrought iron; in

the other spans cast iron is used for the upper chord and the head and foot of the posts. The draw is opened and closed by a small engine resting upon the drum of the turntable. It is also provided with apparatus for turning by hand. General C. H. Booth, secretary of the bridge company, furnishes me the following information relating to the structure:

"The Dunleith and Dubuque bridge was built in the year 1868. It is an iron bridge 1,760 feet long from shore to shore, consisting of six fixed spans and a draw-span, as follows:

	Feet.
Two spans, 250 feet each	500
Four spans, 225 feet each	900
One draw-span	360
Total	1,760

"These spans rest upon substantial stone piers in the river, and abutments on both shores, all well sheathed with boiler iron to protect them against floating ice, and all well riprapped to protect their pile foundations. The entire structure, including the approach on the west bank of the river, cost $932,780.12."

It is used by the Illinois Central Railway Company to connect with their Iowa lines at Dubuque, and has equal facilities for traffic with any other bridge of like character on the Mississippi River between Saint Louis and Saint Paul.

Sabula railway draw-bridge.—Although I have used persistent efforts by correspondence and otherwise to get history, etc., of this structure, I have thus far been unable to secure the desired information, but may subsequently be enabled to do so before the completion of this report. The Chicago, Milwaukee, and Saint Paul Railway Company built the bridge and operate it. Its cost, I should judge, would approximate that of the Dubuque bridge, and its facilities for traffic equal.

Clinton railway draw-bridge.—This bridge was built by the Albany Bridge Company under authority of the legislatures of the States of Illinois and Iowa. The portion over the east channel to Little Rock Island was built and in operation in 1859, and leased to the Chicago, Iowa and Nebraska Railway Company June 26, 1862.

The following is clipped from the Clinton Herald, January 12, 1867:

"The first pile for the piers was driven January 15, 1859, and the last span was dropped upon its bearings December 14 of the same year. The grading to connect it with the Galena Company's track at Fulton was completed by that company January 8, 1860; the first train made its passage over the bridge from the Illinois shore to Little Rock Island at noon January 19, 1860. * * * This portion of the bridge consisted of seven spans, each 200 feet long, of the McCullum patent inflexible-arch truss, supported by stone piers resting on piles. The bridge is reached by pile-way about 1,400 feet long."

In 1868 and 1869 this part of the bridge was entirely rebuilt, and the first span next to the Illinois shore was replaced by an iron truss. It has an available width for rafts to pass through of 180 feet. The remaining portion, 1,200 feet, to the abutment on Little Rock Island was replaced by eight iron spans of 150 feet each. The new piers were smaller, 9 feet wide on top, of masonry resting on piles. The 200-foot span and the two adjoining 150-foot spans were built by the American Bridge Company, of Chicago, on the Post pattern. The next two were built by the Detroit Bridge Company, of Detroit, Mich.; the next two by the Phœnixville Bridge Company, of Phœnixville, Pa.; the next two by the Keystone Bridge Company, of Pittsburgh, Pa.; the last six are of the Pratt truss pattern. The bridge over the Iowa or main channel was commenced in January, 1864, and on January 6, 1865, the first train passed over it. It consists of three spans besides the draw. Two spans are 175 feet and one is 200 feet long. The draw is 300 feet long, and was entirely rebuilt of iron by the Detroit Bridge Company, of Detroit, during the winter of 1886–'87. The other spans are also of iron, and the bridge from the Iowa shore to the island is 850 feet long. The draw is turned by an engine placed on a truss above the roadway. The bridge is owned and operated by the Chicago and Northwestern Railway Company, and by their permission crossed by the Chicago, Burlington and Quincy. Its entire cost, with sheer-booms and other suggested improvements, by proper authority, for the benefit of navigation and safety in passage, which have been constructed and put in place by the company, is:

Draw and bridge from shore to shore	$800,000.00
Sheer-boom on Illinois side	14,000.00
West float, on Iowa side	8,834.06
East float, along Little Rock Island	3,691.89
Total	826,525.95

The sheer-boom and float were built under the supervision of Superintendent of Bridge Work W. D. Walden for the Northwestern Company, and together with the reconstruction of the entire bridge and a draw of the latest and best patterns, make the structure now one of the finest and most substantial on the river. This bridge was declared a post-route of the United States by act of Congress approved February 27, 1867, and had the first draw on the river turned by steam-power. Its facilities for traffic are unsurpassed, as its present permitting transit of two important lines of road without injury or perceptible delay to either fully demonstrates. The Chicago, Burlington and Quincy Railroad Company were authorized by an act approved April 1, 1872, to build a pile and pontoon bridge at this place, but failed to build.

The new Rock Island bridge.—The first Rock Island bridge was built between the years 1853 and 1856, to connect the Chicago and Rock Island Railroad in Illinois with the Mississippi and Missouri in Iowa.

The only authority for construction was an act of the Illinois legislature approved January 17, 1853.

This bridge was so constructed as to prove a very dangerous obstruction to navigation. January 4, 1858, the United States House of Representatives passed a resolution calling for information as to whether this bridge was a serious obstruction, and, if so, what action was necessary on the part of the Government. The Committee on Commerce reported that the bridge as constructed was a material and dangerous obstruction to navigation, but at that time recommended no action on the part of the Government.

At the request of certain members of Congress, a board of engineers was appointed to examine and report upon the Rock Island bridge. Their report, dated May 19, 1859, states that in this case all the principles of bridge building in their relation to interests of navigation were violated, and that the obstruction was materially greater than there was any occasion for.

But it was not till 1866 that any action was secured looking to the removal of the old bridge. In that year Congress passed an act in connection with certain legislation for the Rock Island Arsenal for the removal of the bridge and the construction of a new one. Considerable delay occurred in reaching agreement as to plans, and further delay was caused by the failure of the Rock Island Company to agree to certain conditions. But a joint resolution of Congress, approved July 20, 1868, gave specific authority to the Secretary of War to allow sixty days for the railroad company to file acceptance of certain conditions, and then to proceed to the removal of the old bridge and commence the new structure.

An agreement was reached and work on the new bridge was commenced in 1869, and opened for railroad traffic in October, 1872.

The bridge was built by the United States under the direction of the Engineer Corps of the Army. And in accordance with the acts of Congress the Rock Island Railroad Company refunded one-half the cost of superstructure and one-half the expense of keeping the bridge in repair. The cost of the bridge was $1,000,000, which sum was fixed as the limit of cost by Congress.

The bridge is situated at the foot of the Rock Island Rapids, where the bed of the river is of limestone. The width at the site of the bridge is 1,650 feet; immediately below the width is 3,000 feet.

The bridge, commencing on the Davenport side, is approached by the railroad by a curve of about 1,200 feet radius from the main track on Fifth street to the junction of Fourth and Rock Island streets, which is crossed diagonally on a bridge of one span. The approach then continues on the diagonal to the intersection of Third and Iowa, which is crossed by a single span of 120 feet; then it is on a curve of about 1,700 feet radius to the junction of Second and Front streets, which is crossed by a span of 196 feet to the main bridge.

The main bridge has one span of 260 feet, then three of 220 feet, then one of 260.5, and then the draw, 370 feet from end to end, with two clear openings of 160 feet each. A span of 80 feet then carries the railroad track to the embankment on the island; an embankment across the island and a bridge over the slough of four spans of 150 feet each, and then there is an embankment to the main track on the Illinois side.

The bridge as constructed has two decks, the lower one furnishing a wagon-way 18 feet wide, and two side-walks outside main trusses, each 5 feet wide, and on the upper is laid a single track for the railroad.

The upper deck is now used by the Chicago, Rock Island and Pacific Railroad only. Other roads are, by the act of Congress, granted the privilege of using the bridge by paying to the parties in interest the proportionate cost of the bridge.

The bridge is of wrought iron throughout. The upper chords are of rolled channel-bars and the lower links in the fixed spans. In the draw-span both upper and lower chords are of channel-bars. The draw is opened and closed by an engine placed on the outside of the truss on a level with the railroad floor. The posts are Phœnix beams. The rail-

road floor beams are attached to the posts so as to form a system of lateral bracing. The bridge over the main channel was built by the Baltimore Bridge Company. The masonry of the piers is resting on solid rock bottom foundation over main river and on piles over slough is of a very substantial character. G. K. Warren, major of Engineers, and brevet major-general U. S. Army, in his report on this bridge and all others built across the Mississippi prior to 1878, says: "This bridge has met the wants of navigation as fully as a low draw-bridge is capable of doing. The locality is particularly favorable to this kind of bridge, as there is sufficient depth of water for boats and rafts from shore to shore, and the rock bed renders a change in this impossible." Its facilities for traffic will meet every requirement, and the structure is creditable alike to the Government and the Rock Island Railroad Company.

Burlington Railway Draw-bridge.—This bridge was built by the Burlington Bridge Company, in 1867 and 1868, under act of Congress approved July 25, 1866, and opened for traffic August 13, 1868, by the Chicago, Burlington and Quincy Railroad Company. The bridge crosses the Mississippi River about 4,000 feet below the steam-boat landing at Burlington, Iowa. The river at this point is about 2,100 feet wide between the low-water banks, with a large extent of bottom-land, overflowed 5 to 10 feet at highest water, extending to the Illinois bluffs. The channel of the river for 5,000 feet above the bridge and 3,000 feet below runs along the west bank in a direction for the most part parallel with the shore, which is rocky.

The bridge is approached from the west on an embankment, with a curve of about 720 feet radius. The whole length of the bridge is 2,235 feet.

Georgo C. Smith, chief engineer Chicago, Burlington and Quincy Railroad, furnishes the following:

"It is built of iron throughout, and consists of eight fixed spans and one draw span, of the following lengths:

	Feet.
6 spans, each	250
1 draw	360
1 span	200
1 span	175

"Total cost of bridge was $1,250,000."

The masonry is built of stone from Athens, Ill., and Le Clair, Iowa. Facilities for traffic good.

Fort Madison Railway Draw-bridge.—Information relating to history, character, etc., of this structure has as yet not been received by me. I hope, however, ere the completion of this report to secure it, and if so, will subsequently incorporate it with other bridges within territory assigned to me.

Keithsburgh Railway Draw-bridge.—This bridge was built by the Mercer County Bridge Company, of Keithsburgh, Ill., in 1885, and leased to the Central Railroad, of Iowa. Official history of construction, cost, etc., has not yet been attainable.

Keokuk Railway and Highway Draw-bridge.—This bridge was built in 1869 and 1870, by the Keokuk and Hamilton Bridge Company, under act of Congress approved July 25, 1866.

The river is spanned by twelve spans of the following lengths, commencing at the Keokuk side and measuring along the axis of the bridge, and from center to center of piers: First, a pivot draw-span, 380 feet long from end to end. Then comes spans of 258 feet, 256.3 feet, 162.6 feet, 162.5 feet, 163 feet, 151.5 feet, 164.9 feet, 165.1 feet, 164.3 feet, and 165 feet, respectively, making the total length of bridge about 2,190 feet. On the Illinois side there is a high embankment for 1,930 feet. About 500 of this is in the low-water channel-way. There is next a single span of 95 feet over a slough, and then the embankment is continuous to the high ground, a distance of about 1,200 feet, making a total length of bridge and embankment approach on the Illinois side of 5,475 feet. The approach on the Keokuk side is over a structure of masonry on a curve of about 850 feet radius, the abutment being about 160 feet from the shore-line. The Illinois approach and the bridge are on a straight line. The Keokuk end of the bridge is about 900 feet below the lower end of the Des Moines Rapids Canal. The piers are constructed of limestone, the greater part of which came from quarries in the immediate vicinity. They rest upon a timber grillage, and this upon the rock of which the bed of the river is composed.

The bridge was built by the Keystone Bridge Company, of Pittsburgh, in 1870. It is of wrought-iron throughout, except the head and foot of posts and angle-plates of upper chords, which are of cast-iron. The bridge was built for rail and highway travel on the same floor. The whole bridge, including sidewalks, is floored over at the same level, the top of the track being about 1 inch above this floor. The draw is turned by a small steam-engine on the turn-table, the greater part of the machinery being below

the floor of the bridge. It can also be turned by hand. Estimated cost of bridge and approaches, $1,000,000. Facilities for traffic good

Quincy Railway Draw-bridge.—This bridge was built by the Quincy Railroad Bridge Company in 1867 and 1868, under act of Congress approved July 25, 1866, and opened for travel November, 1868.

The bridge crosses the river about one mile above the landing at Quincy, Ill. The site was chosen because of the channel being permanent along the Missouri shore, thus furnishing a good location for the draw. The width of the river here between low-water banks is about 3,000 feet. The bridge is approached on the Missouri side by a long embankment, with occasional openings in it to allow the passage of flood water when the bottom is overflowed, and for the drainage of the bottom lands. The first span is 250 feet—partly over the land—the next a pivot-draw 362 feet long, with two openings, each 160 feet in the clear; then a span 250 feet long; then two spans, each 200 feet long; then eleven spans, each 157 feet long; and then next to the shore of the island one span of 200 feet. An embankment of 670 feet extends across low land to Wood's Slough; then comes 400 feet of trestling across this slough; then 285 feet of embankment to the bridge over the bay. This bridge has six spans—first, one of 82½ feet; then one of 85 feet; then a pivot-draw 190 feet long, with 80 feet clear openings; then a span of 85 feet, and another of 82½ feet. The draw on this bridge is required by an act of the Illinois Legislature.

The length of the bridge over main river is 3,185 feet, and over the bay 525 feet, making, with trestling and embankment on the island, 5,068 feet from abutment on Missouri shore to abutment on Illinois shore. The masonry of superstructure is of stone from Grafton, Ill., and Keokuk, Iowa. All the piers in the main river, except the pivot, and all in the slough, rest upon wooden piles. The pivot-pier, in main channel, rests upon four iron cylinders, each 14 feet in diameter and 30 feet long, filled with concrete. The superstructure was built by the Detroit Bridge and Iron Works. The fixed spans of the main bridge are quadrangular girders, with cast-iron upper chords, Phœnix rolled posts, and bottom chords of open links. In the draw over the main river both chords are rolled channel-beams riveted together. The bridge over the bay is a Bollman truss, with cast upper chords and posts. The draw is the same, with riveted upper chords, supported by hog-chains over a central tower. The draw of the main bridge is turned by a small steam-engine; that over the bay by hand. Estimated cost of entire bridge and approaches, $1,250,000. Facilities for traffic good.

Hannibal Railway and Highway Bridge.—This bridge was built in 1871, under act of Congress approved July 25, 1866, and opened for travel in 1871.

It crosses the river at a point about 1 mile above the steam-boat landing of Hannibal, Mo. The river at this point is nearly all in one channel, and is very narrow and deep. It was a noted crossing place for the Indians in their day. Its width where the bridge is is about 1,500 feet. On the Missouri side the bridge is approached through a short tunnel. The line of the bridge is at right-angles with the general course of the river. The spans commencing at the Missouri side are, first, one 250 feet from center of piers; then a draw-span 360 feet over all, giving two clear openings of 160 feet; then one span 250 feet, and four of 180 feet each, making the total length of the bridge 1,580 feet. The substructure, commencing at the Missouri abutment, is first an abutment of masonry resting on the rock of the bank; the draw or pivot pier is of solid masonry, resting on piles; the other piers are of solid masonry, upon a grillage, resting on piles. The superstructure of the bridge was built by the Detroit Bridge Company. The draw is iron in all its parts. The other spans are all of wrought-iron except the top chords, which are cast. The draw is turned by a steam-engine, located between the trusses above the roadway. The wagon-way is on the same floor and same level as the railway. Vehicles are not allowed to enter the bridge while a train is on any part of it, and a train is not permitted to enter while a vehicle is on it. The bridge has no sidewalks. It is used by the Chicago, Burlington and Quincy, and Toledo, Wabash and Western Railways. Estimated cost, $800,000; facilities for traffic, as is demonstrated by the two lines that use it, are very good.

Louisiana Railway Bridge.—This bridge was built by the Mississippi River Bridge Company and the Louisiana Bridge Company, consolidated by an act of Congress approved March 3, 1871. It was completed at a cost of $680,000 in 1873, and in 1877 leased in perpetuity to Chicago, Alton and Saint Louis Railroad.

The first span is 162 feet to the center of the draw rest-pier; then a draw-span 444 feet over all, with two clear openings of 200 feet each; then a span of 256 feet; then one of 226½ feet, and then six spans of about 161 feet each from center of piers, making a total length of bridge of 2,050 feet. The piers of the bridge are of masonry, the stone having been obtained from the neighboring bluffs.

The superstructure is of wrought iron, except in some minor parts. The bridge over Noix Creek in the Missouri approach was built by the American Bridge Company of

Chicago. It is 140 feet long. The two long spans and the draw-span of the main bridge were built by the Kellogg Bridge Company, of Buffalo, N. Y. The draw-span is the longest on the Mississippi River, and at the time of its construction was the longest in this country. The short trusses were built by the Keystone Bridge Company. The draw is turned by a steam-engine placed on a turn-table outside of the truss. The usual time to open and close the draw is from three or four minutes. Facilities for traffic equally good with other structures of like character on the river.

The latter concludes a brief description of all the bridges that span the Mississippi River between Saint Paul and Saint Louis that are used for railway traffic. In gaining the information I have taken liberally from the very able report on "Bridging the Mississippi River," made by Bvt. Maj. Gen. G. K. Warren, major of engineers, in the year 1878. This, together with other information as far as it was attainable from every source reliable, has been compiled, and will, on this important subject convey a mass of information not heretofore given to the Bureau of Statistics.

Memoranda of bridges reported and their cost.

	Cost.		Cost.
Hastings, Minn	$300,000	Burlington, Iowa	$1,250,000
Wabasha, Minn	60,000	Fort Madison, Iowa	*700,000
Winona, Minn	*200,000	Keokuk, Iowa	1,000,000
La Crosse, Wis	*300,000	Keithsburgh, Ill	*750,000
Prairie du Chien, Wis	150,000	Quincy, Ill	*1,250,000
Sabula, Iowa	*600,000	Hannibal, Mo	800,000
Clinton, Iowa	826,526	Louisiana, Mo	680,000
Dubuque, Iowa	932,780		
Davenport, Iowa	1,000,000	Total	10,939,306

* Estimated.

Bridges (pontoon) between Saint Paul, Minn., and Saint Louis, Mo., authorized but not built: La Crosse, Wis., and Clinton, Iowa.

Dubuque Highway Bridge.—The highway bridge across the Mississippi River at Dubuque is an enterprise which came to its initial construction focus in 1886.

The contract was let to Mr. H. E. Horton, the lowest bidder, at $125,000, for the entire structure. Work was commenced and the first pile for the foundation driven September 17, 1886, and the celebration of its completion and opening for pedestrians and teams was held November 29, 1887. It is the longest crossing of its kind in the West and exclusively highway in character.

The following description is furnished by Mr. Tschirgi, jr., the engineer: The bridge rests on seven piers; substructure of masonry, founded on piles, having an iron superstructure involving an 18-foot roadway and a walk 5 feet wide on each side. Four spans 205 feet long and one 248 feet appertain to that part of the bridge west of the channel span. The grade over these spans and the 248-foot span east of the channel span is 4 feet in 100. The cantalever channel span is 363 feet in length, leaving each end 50 feet in the clear above extreme high-water mark, while the center is 55 feet above, thus affording ample head-room for steamers. The main bridge is reached on the east end, or Illinois shore, by means of a solid approach, constituted partly by embankment with retaining wall and partly by excavation in the side of the stone bluffs, along a distance of 800 feet, thence by two iron spans, similar to those of the main bridge, each 120 feet long, forming a viaduct over the tracks of the Illinois Central Railroad and Chicago, Burlington and Northern Railroad. The length of the main bridge is 1,760 feet, and the approach 1,040 feet, making the entire length 2,800 feet. The location directly across the river is 75 feet below the Dubuque and Dunleith Railroad Bridge, the draw of which swings under the cantalever span of the high bridge. The channel-piers Nos. 3 and 6 are 72 feet high above the grillage foundations. Construction throughout is according to plans and specifiations approved by the best engineers in the country, all material being rigidly inspected and tested.

The first railway draw-bridge.—The first railway draw-bridge across the Mississippi River, between Saint Louis and Saint Paul, was built in the years 1853 to 1856 to connect the Chicago, Rock Island and Pacific with the Mississippi and Missouri in Iowa, at Davenport, Iowa—the latter road to Iowa City, a distance of 55 miles, then the longest road west of the Mississippi River. The bridge was declared such an obstruction to navigation as to cause it to be torn down in 1872. In its place is one of the finest structures that spans the great river, and there are at this time sixteen railway draw-bridges across the river, and one high bridge (at Dubuque), involving an expenditure approximating $11,000,000 to cross the greatest inland water channel in the world, and forms connecting links with the most important lines of land transportation across the continent.

The number of cars, passenger and freight, separately, which crossed each of the bridges in each direction during the year, and so far as practicable, the quantity and value of the freight which has crossed each, in order that a comparison may be made between the value of the traffic on the river and that which crossed it on bridges.

I have taken great pains to, as far as practicable, get information upon this subject that would be authoritative, but have met with many unexpected difficulties. They have, however, about all been overcome, and in the presentation of the table below am startled at its magnitude and the wonderful development demonstrated by it of the territory under consideration.

	Passenger cars.	Freight cars.	East.	West.
			Tons.	*Tons.*

Total	128,677	1,128,596	5,538,952	3,938,447

* No report of cars. † Bridge under construction.

Of the above east-bound about 45 per cent. was grain and flour, 40 per cent. live stock, and 15 per cent. miscellaneous. Of the west-bound about 55 per cent. was merchandise, 30 per cent. coal and lumber, and 15 per cent. merchandise. It will be observed that the tonnage of the several bridges crossing the Mississippi shows a wonderful increase in the last decade, and since the year 1878, when there were but twelve bridges spanning the river. The increase in bridges has been Wabasha, Hastings, Keithsburgh, and Fort Madison, and the highway bridge at Dubuque since that year, with many more contemplated between Saint Louis and Saint Paul. The increased amount of freight crossing the river since the above period will, in round numbers, approximate 4,000,000 tons, which indicates a transportation development so colossal and growing with such rapidity as to demand every improvement of the great Mississippi River necessary to continue it as a regulator of a traffic in which so many toiling millions of people are interested. Sixteen bridges now span the river between Saint Louis and Saint Paul, used for railroad crossings. More will be built, and more lines of road use those already constructed. Iowa is now a perfect network of railroads; the ninth annual report of the Board of Railroad Commissioners shows a total number of 7,564.47 miles in the State, which places her the second State in the Union in miles of railroad, Illinois being first, with 8,904.77. Sixty-two per cent. of the Iowa tracks is laid with steel rails, and the total cost of construction and equipment of the thirty-four roads reporting is $844,515,450.94; proportion for Iowa, $275,680,542.50. The total number of persons regularly employed in operating the roads in the State is 25,761; the amount paid for their services in 1886 as reported is $13,677,780.53; and the tonnage carried by the Iowa roads during the year was 12,643,364, an increase over the preceding year of 252,339. It is estimated by the commissioners that 25 per cent. of this tonnage originated within the State, while the balance was through freight, and from the best information attainable this freight was carried at an average cost per ton per mile by the seventeen roads reporting, in cents and fractions of cents, 1.70, although these figures may not be considered reliable as the same elements do not enter into the determination of cost.

The aggregate earnings from freight of these roads in 1870 were $26,547,890; in 1885 the earnings were $69,444,567; or the freight earnings of 1870 were 38.22 per cent. of 1885. The tons of freight carried in 1870 were 7,279,147; in 1885, 30,615,679; or the tons of freight carried in 1870 were 23.77 per cent. of the tons carried in 1885. The total number of passengers carried during the year 1886 was 26,150,306, and the average distance traveled by each passenger was about 38 miles; the amount paid about 90 cents. The total earnings for the year ending June 30, 1886, was reported as $36,093,106.54, the passenger being 27.3 per cent. of the entire earnings. The operating expenses of the

roads for the year were $23,093,581.04, showing net earnings of $13,030,006.41. The operating expenses were a decrease from the former year of $162,025.94, and the increase of the net earnings over the previous year was $56,545.03. Seventeen roads on their entire lines show as applicable to dividends and surplus, after paying operating expenses, interest, and rentals, an excess of $21,925,351.40; fifteen roads a deficit of $3,697,718.04, leaving on the entire lines of these roads an excess of $18,227,633.36 of profit on a capital of $415,010,066.52, or 4.40 per cent.

Statement of railway lines which ferry their cars across the river between Saint Paul and Saint Louis, and similar information in regard to the traffic across them, which was asked for above in regard to the commerce over the bridges.

There is but one railroad company, and that a new line, the Chicago, Burlington and Northern, which runs on the east bank of the river from Rock Island to Saint Paul, and uses a steam-boat to ferry its cars across the river from Dunleith to Dubuque and back for local business only. The amount of freight thus transferred I have been unable to get, but it has been limited, and now that the high bridge at Dubuque has been completed, the probability is that this freight will be hereafter transferred by wagon. Aside from this one point there is no ferry transfer in the territory under consideration at the present time. All have been supplanted by bridges, a full description of which has been previously given.

Any further matters relating to the traffic of the river and across it by rail, which may occur to you to further exhibit its position and future as a factor in the great question of transportation.

The water-ways in the west are the greatest ways of commerce the land knows. People generally believe that commerce on the Upper Mississippi has been almost abandoned because of railroad competition, yet during the navigation season of eight months more freight is floated on the Upper Mississippi than any of the three great trunk lines of railroad carry in a year, and at about one-third the rate. The traffic now carried on upon the upper river and its tributaries is much more extensive than is commonly supposed, as persistent efforts are made, presumably in the railroad interest, to create the impression that the river has virtually gone out of use. Between the Chippewa and Saint Louis there are 80 mills on the main river, with a daily sawing capacity of 800,000,000 feet of lumber, employing some 16,000 men, and representing about $20,000,000 of capital. On the Upper Mississippi and its tributaries, the Saint Croix, Chippewa, Wisconsin, and Black, there are about 200 mills engaged in the manufacture of lumber, the greater part of their product being floated into the Mississippi; and it is estimated by experts that in the year 1886 there was saved, or rather the fact appears that Mississippi navigation made a difference to merchants, manufacturers, and shippers in river cities and places contiguous to the river of nearly $4,000,000—that is, the railroad charges were less by that amount than they would have been without river competition. It must also be borne in mind that without the improvement of the navigation of the river the saving could not have been possible, because navigation would have been suspended in low water and railroad rates advanced accordingly.

The aggregate number of passengers transported on steamers on the upper river in 1886 was 965,803. No ferry business is included, but only persons who paid fare to and from ports distant from each other. The improvement of the navigation of the river is of greater importance than most of the people, even those living in the cities upon its banks here in the North, where railroads traverse both its banks from Saint Louis to Saint Paul, imagine, because the great majority do not consider the facts, but believe the railroads are killing its commerce. It is clearly shown by the figures above in this report that the theory of destruction to transportation benefits in consequence of the falling off in some branches of river business is clearly fallacious, as, if there was not a pound of miscellaneous freight carried upon her bosom, the benefits derived from her presence would be incalculable, standing as she does as a menace by nature to all artificial competition, and free to all who wish to use her for transportation purposes, upon equal terms, with no opportunities for pooling nor discrimination that to-day is the great evil in every other means of communication. It is the great "American" inland route, owned by the people, controlled by the "Government," and its continued improvement and proper care is demanded by no section nor combination, but by the millions of citizens that inhabit and have developed its fertile valley. And they are reenforced by every lover of cheap transportation and its beneficent results in the United States.

Let us go back to the primeval days of navigation on this great inland sea, and trace it along from reliable data to the present time.

EARLY HISTORY.*

Pioneer navigation on the Mississippi River was accomplished by the keel-boat system, which was not superseded by the modern steam-boat until 1823. This species of craft resembled somewhat the barge of the present day, except that it was covered with a deck, with gangways on either side to admit of free passage from fore to aft. They were from 80 to 100 tons burden, and were supplied with oars and long blade-like rudders similar to those now used for steering rafts. There were various ways of propelling the keel-boat, among them rowing, (the system more commonly resorted to), cordelling, warping, bushwacking, towing, and sailing. "Cordelling" consisted of making a rope fast to the masthead, the crew hauling it over their shoulders on shore, or otherwise towing it. "Warping," which was resorted to only in very swift currents, consisted of towing a line by means of a small skiff or canoe of the keel-boat and making it fast to the body of a tree close to the bank, the keel-boat end of the line being carried over the shoulders of the crew from forward to aft, the leaders dropping out and falling in behind until the shore-end of the line was reached, when the boat would be held fast until a second line was towed forward and tied to another tree. The first line would be cast off and hauling resumed until slow water was reached. It will be seen, therefore, that navigation by this means was both slow and laborious. "Bushwacking" was resorted to when running close to banks lined with willows. These were grasped by the crew, each man walking from fore to aft and drawing the boat forward in much the same manner as by "warping." The other plans of rowing, sailing, and towing need no explanation.

Among the first navigators of the Upper Mississippi, in keel-boats, and the pioneer steam-boatman of the Upper Mississippi, Wisconsin, and Minnesota rivers, also Lake Saint Croix, was Capt. D. Smith Harris, who still survives, hale and hearty, though an octogenarian, and is an honored citizen of Galena, where he has resided continuously sixty-four years. From Captain Harris, probably the oldest living citizen in the Northwest, it is learned that the first steam-boat to ascend the Upper Mississippi was the *Virginia*, from Pittsburgh, which landed at Galena in June, 1823, with a large cargo of stores and mining utensils, and proceeded up the river to Fort Snelling with supplies for the Government garrison at that place. The *Virginia*, together with one or two other steamboats from Pittsburgh, Wheeling, Cincinnati, and Saint Louis, continued to make periodical trips from that year on until steam-boating became general.

The first steam-boat ever built on the Upper Mississippi was the *Jo Davies*, which was launched at Galena in the spring of 1834 by Capt. D. S. Harris and his brother, the late Capt. R. Scribe Harris, also a pioneer river man. The next steam-boat built was the *Saint Louis Oak*, which was launched at Saint Louis the same year, though somewhat later than the *Jo Davies*.

Until Chicago gained the ascendency, by the opening of the Milwaukee and Prarie Du Chien Railroad, the city of Galena was the most important point north of Saint Louis, and the chief basis of supplies for the entire Northwest.

No record of the early steam-boat arrivals at Galena is obtainable, but that they were numerous until the completion of the Illinois Central Railroad is evidenced by the fact that 24 large steam-vessels were lying at the levee in that city at one time receiving and discharging freight. The tonnage increased from a few thousand pounds, in 1823, to an enormous figure, until it reached its height, as above stated, and it began to wane, low water making Galena practically an inland town. The first regular packet to run between Cincinnati and Galena was the steam-boat *Smelter*, built at the former city in 1837 by Capts. D. S. and R. Scribe Harris.

The first company to run a line of steamboats on the Upper Mississippi was organized at Galena in 1849, and was known as the Minnesota Packet Company. The running of the boats of this company proved to be a success financially, not only to the company, but it opened up a large and profitable trade with the river and interior towns of Iowa and Wisconsin above Galena, and the entire State of Minnesota. The company also contributed very largely to the development of these States, and was a source of wealth to the merchants of Galena. It was afterwards called the Galena, Dubuque, Dunleith and Minnesota Packet Company, then the Northwestern Packet Company, and a few years later was merged into the Keokuk Northern Line Packet Company, by which name it is now known. The names of other companies, their work and performance, have been previously referred to, and require no repetition here. From the Saint Louis Globe-Democrat of recent date we clip the following scrap of early navigation history that we deem very appropriate here:

"J. L. Carver, a well-known river engineer, after several years absence has returned to Saint Louis. He began river engineering on the old *Planter* in 1847. In the old days of the steamer *Sucker State*, on the Upper Mississippi during the war, he set the pegs for

* For an account of the discovery of the Mississippi River, see Internal Commerce of the United States, 1886, pp. 592-3.

speed, and they have never been changed. He made the run from Saint Louis to Saint Paul in two days twenty hours and eleven minutes. Capt. W. B. Haight was in command, and Charlie Manning and 'Billy' Woods pilots. This is the fastest time ever made on the Upper Mississippi, at least the fastest that we can find any record of. The interstate law has been shaking up railroad freights throughout the Northwest since it went into effect, but leaves the old reliable water transportation untouched. As a consequence all along our great river has been unusual bustle and activity during the past season."

The *Mary Morton*, *Josie*, *Libbie Conger*, *Josephine*, and *Pittsburgh* constitute a line of passenger and freight steamers for the navigation of the Mississippi between Saint Louis and Saint Paul, known as the Diamond Jo line, and have been in this trade about twenty years, carrying an enormous amount of freight and passengers annually, but for some reason best known to themselves, I have been unable to get from the main officers or their agents such statement of their business that could not prove other than interesting and of value to the people on this great transportation question. Any river city of commercial importance which would take advantage of its opportunities under the interstate-commerce law, would rapidly become a great market for grain and produce, would exchange merchandise for those articles, and thus, besides assisting to build up Western enterprises and the West with money that now goes to the East for transportation charges, would boom itself, and would give the farmer a larger part of the ultimate value of his produce than he now receives. In days gone by there were many important grain and produce markets on the banks of the Mississippi, but the railroad companies naturally wanted the long haul, and the result was that they gave to interior points tributary to these river market towns as good if not better rates to Chicago or New Orleans than the river town enjoyed. It had found that a large part of the produce they carried to the river points had reached its ultimate destination via the Mississippi river. Had the river cities offered better prices for produce than the interior points the railroads would probably have retaliated by lowering their rates. The interstate commerce law, forbidding a higher charge for a shorter than for a longer haul, gives the river cities extraordinary advantages as produce markets. The law has had the effect of advancing rates from all interior tributary points to Chicago, and from Chicago to New York. It would now cost at least 63 cents to send grain from these river cities to Liverpool via Chicago and New York, but from the same places it can be forwarded to New Orleans via Diamond Jo or Saint Louis and Saint Paul line of steam-boats to New Orleans and thence to Liverpool for 43 cents. This practically demonstrates the great advantage of the water route over the rail, and thus will it ever be so long as they are improved and kept open as at present. Nature has so decreed it, and no artificial means will divert its benefits.

SUPPLEMENT TO PART I.

CITIES AND TOWNS BETWEEN SAINT PAUL AND SAINT LOUIS.

By W. F. SWITZLER, *Chief of Bureau of Statistics*

After examining the manuscript of the foregoing report, the Chief of the Bureau of Statistics on January 6, 1888, wrote to Mr. Johnson that his report did not present the commerce of either of the important cities and towns on the Mississippi River between Saint Paul and Saint Louis, which was referred to as a matter of regret, especially in view of what other experts had accomplished in this direction in regard to those portions of the river assigned to them. Attention was also directed to the fact that his report did not contain a detailed statement of the amount and value of the merchandise, etc., transported up and down the river on the through route between Saint Paul and Saint Louis, the desire being expressed that these statistics be obtained or their absence accounted for. The question was also asked if it was not possible to obtain, with more or less detail, the imports and exports by river of the more important towns and cities between the points indicated.

To this letter Mr. Johnson, on January 14, replied that he found it impracticable to obtain the information desired; that he had attempted to do so in respect to the amount and value of the merchandise, etc., transported up and down the river and failed. Continuing, he says:

"I hope this will be a satisfactory explanation of the omission, which I assure you is as much regretted as is possible by you or the public, as I was and am extremely anxious to have my report as complete as circumstances would make possible, and an honor to your earnest efforts as well as creditable to myself.

"Referring to the possibility of securing a report of the imports and exports by river of the more important towns and cities between Saint Louis and Saint Paul, the above is my answer.

"With reference to additional matter for the report [in regard to the business, etc., of the cities and towns] I would reply that this is a question fully considered by me before transmitting my final manuscript and last letter. The question is of such broad and diversified latitude and of such interest and magnitude when looking along the great river and the 'empire,' it must be termed, that has special interest in it, that I might go on with almost interminable labor, and still find something of interest to report; but there must be a stop, and I feel as though I have arrived at that point, and would far rather have my work thus far done receive your favorable consideration, in which I assure you, sir, I take pardonable pride and am truly thankful for, than attempt farther elaboration and volume that might be otherwise accomplishing no more than perhaps unfavorable criticism and a destruction of what has already been satisfactorily accomplished.

"I could give a very interesting history of my own and neighboring towns, together with several more between the points named, but in doing this it must be remembered that a very large proportion of towns and important cities must be omitted, or make personal visitation to them, besides personally gathering the information and writing them up—a task that would involve more expense by far than the total amount allowed, and time that I am sure you, under no circumstances, would accord. The towns and cities referred to have been repeatedly visited and earnestly entreated by letter and circular to furnish this information for my report, and their promises to do so were multitudinous, but never redeemed. Consequently what was I to do but what I have done? Stop, and let their people bear the loss that your grand opportunity gave them of being known throughout the world."

Mr. Johnson, thus despairing of being able to obtain information in regard to the commerce, manufactures, business, etc., of the more important towns between Saint Paul and Saint Louis, the chief of the Bureau himself undertook the task of collecting statistical and other information in regard to the industries, business, trade, commerce, etc., of Saint Paul and Minneapolis, two of the most important cities within the territory involved, and the result of his efforts in this behalf is given below.

SAINT PAUL AND MINNEAPOLIS.

These two rapidly-developing cities are very near each other, and the interests of one in many respects can not be intelligently presented without considering and presenting the interests of the other. The distance from the union depots of the two cities respectively is 10 miles. The limits of Minneapolis extend 2½ miles from the center of the city; of St. Paul, 7½ miles.

RIVER FREIGHT BETWEEN SAINT PAUL AND SAINT LOUIS.

In reply to a letter to Mr. E. M. Dickey, superintendent and general freight agent of the Diamond Jo line of steamers, from the chief of the Bureau of Statistics, that gentlemen answers that during the season of 1887 the Diamond Jo line carried 257,354,078 pounds of freight between Saint Louis and Saint Paul.

TRADE AND COMMERCE OF SAINT PAUL FOR THE YEAR 1887.

(We are indebted to the Saint Paul Pioneer Press and to Mr. A. S. Tallmadge, secretary of the Saint Paul Chamber of Commerce, for the following account of the commerce, etc., of that city.)

The following statements are historical and authoritative:

The first survey of Saint Paul was made in 1855, or thirty-two years ago; although the town incorporation was made in 1849, when, by judicious counting of all whites and Indians that frequented the town, there were 840 inhabitants. The city to-day, based upon post-office statistics and the city directory, has 208,855 population, against 41,498 in 1880.

In 1870 there were 88 manufacturing concerns, employing less than 1,000 operatives. Now there are nearly 1,100 establishments, employing 27,658 operatives.

The wholesale trade in 1863 reached the sum of $250,000, and it was a good deal talked of; for 1887 it has not been less than $100,000,000.

In 1855 a frame structure of any kind or description was considered almost an epoch in building; 1887 brings about an expenditure of $11,500,000 in the same line.

Twenty-five years ago the first iron rails were placed in this vicinity. Now nearly 300 passenger trains arrive and depart daily from the city, and more than one-third of all the railway construction in the United States was built tributary to Saint Paul. Sixteen thousand two hundred and sixteen car loads of freight received in 1887, and 96,448 forwarded.

Seven years ago the total volume of real estate transactions was less than $3,000,000 annually, against $54,000,000 for 1887.

Saint Paul is the money center of the Northwest. There are fourteen banks, with an average capital of over $500,000 each. The clearings of the Saint Paul banks are increasing marvelously—anywhere from $3,000,000 to $10,000,000 per month, according to trade conditions.

AREA AND PRODUCTIONS OF THE SAINT PAUL TRADE BELT.

The belt of country which is made exclusively tributary to Saint Paul by the Manitoba and Northern Pacific, and to a less extent by the other lines of the Saint Paul system, embraces an area of nearly 400,000 square miles, equal, as has already been said, to ten States of the size of Ohio, or, in other words, it embraces an area equal to that occupied by Pennsylvania, the two Virginias, Ohio, Kentucky, Indiana, Illinois, Iowa, and Missouri, which, in 1880, had an aggregate population of 21,000,000. Its aggregate natural resources are not greatly inferior to those of these nine great central States. Minnesota and Dakota, with those portions of Montana and Wisconsin embraced in the Saint Paul belt, as shown on the map, now contain an aggregate population of about 2,000,000. This territory is capable of sustaining at least ten times its present population without being more thickly settled than Indiana.

Production of the Saint Paul belt in 1887.

Articles.	Quantity or value.	Articles.	Quantity or value.
Wheat ..... bushels..	95, 000, 000	Hogs ..... head..	809, 000
Oats ..... do....	90, 000, 000	Horses and mules ..... do....	627, 000
Corn ..... do....	47, 000, 000	Wool clip of Minnesota... pounds..	1, 460, 602
Other cereals ..... do ..	16, 000, 000	Lumber ..... feet..	2, 000, 000, 000
Butter ..... pounds..	46, 000, 000	Iron ..... tons..	390, 568
Cheese ..... do ...	1, 250, 000	Silver	$18, 466, 561
Cattle ..... head..	2, 500, 000	Gold	$5, 496, 126
Sheep ..... do....	1, 622, 000	Copper	$5, 000, 000

Every foot of these great areas and all their productive resources are thus made tributary to the trade of Saint Paul. It is the terminal headquarters of the Manitoba, the Northern Pacific, the Omaha, the Chicago, St. Paul and Kansas City, the Burlington and Northern, and the St. Paul and Duluth. Moreover, Saint Paul is the center upon which converge all the lines of the entire system of railway transportation in the Northwest. Fifteen lines of railway center here. Seven great railways connect it with Chicago, and are in active competition for its importing trade.

The figures for the past year, giving the amount of business transacted by the various railroad lines centering in Saint Paul, show the receipts for the twelve months over all lines to have been 2,389,860 tons, and the shipments 1,440,060 tons. The greatest receipts of the year were coal, of which 33,221 car-loads came to the city; the greatest shipments were of merchandise, 48,358 car-loads leaving the city. Among live stock the greatest receipts were of cattle, of which 1,128 car-loads arrived; the greatest shipments were of horses and mules, of which 508 car-loads left the city.

RAILROAD CONSTRUCTION IN 1887.

Northwestern roads fully completed over 3,500 miles of track in 1887, two-fifths of which is located in Dakota and Montana, where the grain, mining, and live stock interests are being rapidly developed. The mining and lumber interests of Wisconsin and northern Michigan have, next to Dakota and Montana, received the greatest attention, and next comes the belt lying south of these States. The following table shows the number of miles constructed by each railroad company and the location and length of each individual piece of road which has been completed in 1887.

The number of miles constructed by each railroad company is as follows:

Railroads.	Miles.	Railroads.	Miles.
St. Paul, Minneapolis and Manitoba....	845.00	Wisconsin Central	33.62
Montana Central	97.00	Northern Pacific	310.00
Chicago, Milwaukee and St. Paul.....	371.00	Illinois Central	387.00
Minneapolis, Sault Ste. Marie and Atlantic	357.00	St. Paul and Duluth	15.00
Chicago and Northwestern	135.69	Chicago, St. Paul and Kansas City...	305.60
Duluth, South Shore and Atlantic.....	204.00	Minneapolis and St. Louis	10.00
Fremont, Elkhorn and Missouri Valley..	358.00	Minneapolis and Pacific	71.00
Chicago, St. Paul, Minneapolis and Omaha	34.05	Total	3, 533.96

MANUFACTURING.

The manufactured product of Saint Paul for the year 1887 aggregates $35,713,314, as shown by the table given below. This is an increase of about 15 per cent. over last year's product:

Manufactures.	Number establishments.	Number employés.	Value of product 1887.	Increase over 1886.
Agricultural implements, wagons, etc	15	400	$1,500,000	$140,000
Brooms and brushes	3	50	80,000	5,000
Breweries, etc	11	300	1,600,000	150,000
Brass, iron, founderies, machinery, etc	20	634	2,000,000	160,000
Book-binding, printing, publishing, etc	30	1,500	2,000,000	150,000
Barrels and cooperage	5	150	160,000	30,000
Boots and shoes	25	1,000	1,100,000	100,000
Brick	16	500	1,000,000	100,000
Confectionery, crackers, bakers, etc	3	225	750,000	80,000
Contractors and builders	175	7,000	11,543,314	3,590,314
Creamery (Crescent)	1	60	600,000	.....
Cigars	37	700	1,500,000	125,000
Clothing and gents' furnishing	5	400	1,000,000	80,000
Caskets, undertakers, etc	1	35	120,000	.....
Drugs, chemicals, oils	10	300	800,000	80,000
Flour and feed mills	4	50	1,100,000	100,000
Furniture, upholstery, etc	12	300	300,000	30,000
Furs	10	200	415,000	40,000
Gloves	1	35	40,000	.....
Galvanized iron	4	150	250,000	25,000
Harness and saddlery	6	200	300,000	30,000
Marbles, mantels, stone, etc	35	500	1,100,000	110,000
Picture-frames, moldings, etc	2	25	30,000	5,000
Pork packing, slaughtering, etc	50	300	1,600,000	150,000
Spices	7	200	500,000	75,000
Sash, doors, box, planing mills, etc	17	1,800	1,600,000	175,000
Tin, hardware, stoves	13	300	600,000	50,000
Wool and knit goods	....	150	125,000	50,000
Miscellaneous*	200	1,000	2,000,000	110,000
Total	748	18,464	35,713,314	5,740,314

*Miscellaneous, includes pickles, sirup, patent shoe cleaner, trusses, terra-cotta, trunks, baking powder, oil covers, extracts, hoisting machinery, elevators, stamps, soap, show-cases, vinegar, cement and lime, sewer pipes, starch, tents, soda-water, hair goods, fishing tackle, rosettes, electric-light plants, wire works, suspenders, cloaks, boats, artificial limbs, carpet weavers, cutlery grinding, dyeing, dry plates, nickel plating, lumber, fire-proof building material, fire-works, opticians, plastering, type founderies, sporting goods.

The growth of the manufacturing interests of the city since 1870 is illustrated by the following figures, showing the manufactured product for each year up to the present:

Year.	Amount.	Year.	Amount.
1870	$1,611,378	1882	$22,290,589
1874	3,953,000	1884	26,662,000
1878	6,150,900	1885	29,437,000
1880	12,212,148	1886	31,043,000
1881	16,071,535	1887	35,713,314

WHOLESALE BUSINESS OF SAINT PAUL IN 1887.

Commensurate with her remarkable growth in building operations, manufacturing interests, population, wealth, and other essentials which tend to make a great city, has been the wholesale business of Saint Paul during the year 1887.

In 1870 the jobbing sales amounted to about $10,000,000; in 1881 they had increased to $46,350,000. In 1882 the increase was nearly 50 per cent, and since that year the magnificent total has risen, until in 1883 it was $72,000,000; in 1884 it was $74,329,000; in 1885 it was $81,596,000; in 1886 it was $84,188,000, and in 1887, the most prosperous year the city has ever known, it has reached the grand sum of $97,126,000. In six years the increase has been over 110 per cent. An important factor in the increase this year has been the equalization of railroad rates by the interstate commerce law.

The Saint Paul Pioneer Press publishes a tabulated statement of the actual business done by the wholesalers and jobbers during the year 1887, from which we learn that the number of establishments is 501; number of employés, 7,669; amount of sales, $97,126,000, an increase in the amount of sales over 1886 of $12,958; sales of groceries, $13,500,000; grain, flour, feed, and commission, $11,482,000; dry goods, $11,000,000; fuel and pig-iron, $5,678,000; boots and shoes, $4,700,000.

BANKS.

Total number of banks in 1887	14
Aggregate capital	$6,675,000.00
Surplus and undivided profits	2,351,164.00
Deposits	18,630,675.00
Loans	19,599,000.00
Exchange	160,427,000.00
Post-office:	
Business in 1887	713,620.74
Money orders	4,153,215.11
Net profits	189,017.20

1881, 10 tons per day; 1887, 31 tons per day.

Internal-revenue collections, 1887, $546,536.52.

Saint Paul custom-house:

Value of free goods, $166,819; value of dutiable, $1,154,718; duties collected, $875,027.51.

PUBLIC IMPROVEMENTS, 1887:

Sixty-seven miles streets graded, costing $999,000; 11 miles streets paved, costing $500,000; 17 miles sewers constructed, costing $640,000; 40 miles sidewalks constructed, costing $84,000; bridge work constructed, costing $67,000.

Four thousand four hundred and fifty-five new buildings, costing $12,930,314.

REAL ESTATE.

The whole number of real estate transfers filed in 1887 was 14,078, with the aggregate considerations $55,316,571. Add to this amount $4,764,565.50, representing deeds affecting Saint Paul suburban property, filed in the Washington County register's office, and we have a grand total of $60,081,136.50, as the transfer record for the remarkable real estate year 1887.

Population 1887 (estimated), 225,312.

MINNEAPOLIS.

TRADE AND COMMERCE OF MINNEAPOLIS FOR THE YEAR 1887.

[We are indebted to Mr. C. C. Sturtevant, secretary of the Chamber of Commerce of Minneapolis, and to the Saint Paul Pioneer Press for the materials which form the body of this article.]

The volume of trade at Minneapolis shows a more rapid growth than in any former year in the history of the city.

The causes producing this are various, one of the principal factors being greatly increased transportation facilities by which extensive territory has been opened to our trade, and lower rates to the sea-board and interior points secured.

During the year 1887, 6,428 miles of railroad have been added to the mileage of the eleven roads centering in this city. A large portion of this is new track laid during the year, the remainder being roads previously built and connected with the city by the new road constructed, or by purchase of road, by the companies whose lines center in the city.

At the close of the year the mileage of these roads was as follows, compared with 1886:

Name of road.	1887.	1886.
Chicago and Northwestern	7,066	6,552
Chicago, Burlington and Quincy	6,315	3,831
Chicago and Rock Island	4,177	3,058
Chicago, Milwaukee and Saint Paul	5,646	5,201
Northern Pacific	3,280	2,955
Saint Paul, Minneapolis and Manitoba	2,711	1,835
C., St. P. and K. C	841	602
Wisconsin Central	720	720
M., St. M. and A	498	141
Minneapolis and Pacific	288	218
Saint Paul and Duluth	225	225
Total	31,767	25,338

At the beginning of the year, four of the above-named roads had been running but one to three months, and it was not until the close of the year that the Soo line* was completed and opened to through business with the sea-board.

This, with other causes, have given an impetus to all lines of trade.

There were received of local freight (no transfers counted) 173,919 car-loads of freight. In this was included 45,504,480 bushels of wheat and about 5,000,000 bushels of other grain, 330,605,000 pounds of merchandise, 35,416,000 pounds of fruit, 65,000,000 feet of lumber, 39,000,000 pounds of machinery, and 334,000 tons of coal.

These are some of the leading articles.

The shipments were 153,178 car-loads. Included in this were 6,216,143 barrels of flour, 190,662 tons of bran, 12,347,440 bushels of wheat, 341,076,982 pounds merchandise, 163,580,000 feet lumber, 38,773,000 pounds machinery, and 6,879,250 pounds household goods, etc.

The general trade of the city was largely increased, especially the jobbing and retail trade. Freight schedules are now such that our merchants can successfully compete with Chicago and Eastern markets for the trade of the Northwest.

There are some seventy-five firms in this city doing a large jobbing trade in the various lines of goods.

These firms distribute goods through Wisconsin, Iowa, Nebraska, Minnesota, Dakota, Montana, Washington Territory, and at all points in the Northwest reached by railroads. Each year adds new territory and very largely increases this class of business.

FLOUR.

In manufacturing, flour is a leading industry. There are 24 flouring mills, with daily capacity of from 300 to 7,000 barrels each.

The number of barrels of flour manufactured during the milling year ending September 1, 1887, was 6,375,250, and of this 2,523,030 barrels were exported. About 400,000 barrels were consumed in Minneapolis. The following table shows the production and export of flour for ten years:

	Barrels made.	Exported.
1887	6, 375, 250	2, 523, 030
1886	5, 951, 200	2, 288, 500
1885	5, 221, 243	1, 834, 544
1884	5, 317, 672	1, 805, 876
1883	4, 046, 220	1, 343, 105
1882	3, 175, 910	1, 201, 631
1881	3, 142, 972	1, 181, 322
1880	2, 051, 840	769, 442
1879	940, 786	109, 183

Although the number of mills has not increased during the year, their capacity has been increased by about 10,000 barrels by strengthening the power in some and adding to the machinery in others. The 24 mills now have a daily capacity of 36,285.

Minneapolis has handled 46,000,000 bushels of wheat during the year, an increase of 11,000,000 bushels over the preceding year. Of this she converted 27,000,000 bushels into flour and has sent out about 12,000,000 bushels to supply Eastern and Southern mills.

Of the product of flour for 1887, 2,683,500 barrels were shipped on through bills of lading directly to foreign countries. The remaining product was distributed to all the States and Territories east of the Rocky Mountains, with considerable shipments to the Pacific coast.

The New England States are the largest purchasers. The shipments are mainly direct to the point of consumption. Railroad freights are so adjusted as to make a considerable saving to the purchaser.

As a flour manufacturing city Minneapolis leads all others. As exporters, Minneapolis millers lead all others, as their exports were greater than the entire product of the mills in any other city.

Amount of money paid to railroads as freight on wheat received in this city during 1887, and the freight paid to railroad on flour, bran, and wheat shipped from the city in 1887:

Paid on wheat received	$4, 550, 448
Paid on wheat forwarded	1, 234, 440
Paid on flour forwarded	4, 513, 001
Paid on bran forwarded	762, 648
Total on wheat, etc., produced	11, 010, 537

*The Soo line comprises the Minneapolis, Sault Ste. Marie and Atlantic and the Minneapolis and Pacific, and is called "Soo" as a contraction to Sault Ste. Marie.

LUMBER.

The manufacture of lumber is a leading industry of Minneapolis. There are 17 lumber mills in the city. The annual cut is about 250,000,000 feet. This lumber is distributed through Iowa, Kansas, Nebraska, Minnesota, and Dakota, all by railroad.

The Government was the pioneer in the building of a saw-mill, as it was in the building of a flour-mill. The old Government mill was located on the east side of the river and was a combination feed and saw-mill. It was not until 1847 that any steps were taken to locate a saw-mill to turn out merchant lumber. This was built by Franklin Steele on the east side of the river. In 1852 Simon Stevens built a mill on the east side of the river, and the growth of what is now the city of Minneapolis was considerably stimulated by the enterprise, and its upbuilding aided by the lumber turned out of the mill. Mills did not multiply rapidly at first on the west side of the river, but on the east side a dam was built across the east channel at the head of Hennepin Island, 600 feet above where the present dam is located, and on this dam were located four saw-mills.

There was a gradual development of the lumber interest from the first. Although there is no record of the amount of lumber cut in each year until 1870, from that date on there was a gradual growth in the amount of lumber manufactured, until a depression came in 1876. With the growth of the country came increased demand, and except during the last two years, when unusual causes have operated to reduce the cut, there has been a steady increase in the amount of lumber turned out, as shown by the following table:

Years.	Feet.	Years.	Feet.
1870	118, 233, 113	1879	149, 754, 547
1871	117, 157, 029	1880	195, 452, 182
1872	167, 918, 814	1881	234, 245, 071
1873	189, 909, 782	1882	314, 363, 166
1874	191, 305, 679	1883	272, 793, 222
1875	156, 665, 000	1884	300, 724, 373
1876	200, 371, 277	1885	313, 998, 166
1877	129, 076, 000	1886	262, 636, 019
1878	130, 274, 076	1887	220, 822, 974

A new impetus will be given to the lumber trade of Minneapolis by the opening of the Soo Railroad, as it traverses large tracts of pine and hard-wood country which were not previously accessible. Lumber mills are being built along the line, and this will furnish the market for their product.

Large quantities of lumber have been shipped from mills in Wisconsin to this market for distribution.

MANUFACTURES.

The manufacture of agricultural implements has become an important industry in the city. Large shops, giving employment to some 2,000 operatives, are in operation manufacturing harvesters, thrashers and plows, and other implements.

Minneapolis distributes more implements manufactured at other places than any other city in the country. All the leading manufacturers have established houses for distribution of their goods.

But the whole story is more concisely told in the following table, a number of minor manufactures, such as pickles, starch, medicines, pottery, tools and wire works being classed miscellaneous, and flour and lumber being considered elsewhere:

Articles.	Value.	Articles.	Value.
Agricultural machinery	$921, 000	Paper	$190, 000
Mill machinery	500, 000	Woolen goods	500, 000
Railroad machinery and stock	3, 800, 000	Shirts and linen goods	152, 500
General machine work	1, 650, 000	Bags and sacks	577, 500
Boiler work and stoves	603, 000	Coffee and spices	210, 000
Carriages, wagons, and blacksmithing	385, 000	Crackers and confectionery	862, 500
Sheet metal and galvanized iron work	385, 000	Glass	80, 000
Furniture and mattresses	758, 000	Beer	894, 000
Sash, doors, and blinds	2, 098, 800	Cigars and tobacco	605, 800
Caskets and organs	75, 000	Paints and oils	952, 500
Brooms and brushes	110, 000	Packing and curing	575, 000
Boxes, wooden and paper, ladders, etc.	75, 000	Brick and stone	291, 600
Planing mills	250, 000	Trunks and valises	75, 000
Cooperage	1, 010, 900	Show-cases	300, 000
Harness and horse goods	570, 000	Soda water, pop, etc	150, 000
Boots and shoes	862, 500	Jewelry	45, 000
Belting	80, 000	Printing	1, 100, 000
Gloves, moccasins, and fur goods	70, 000	Minor manufactures	500, 000
Dry goods	1, 032, 250		
Knit goods	175, 000	Total	23, 461, 850

The following figures show the increase for twelve years:

Year.	Value.	Year.	Value.
1876	$3,776,133	1882	$16,929,764
1877	4,802,300	1883	21,822,862
1878	5,696,625	1884	21,793,070
1879	8,155,100	1885	21,005,000
1880	10,330,000	1886	22,365,900
1881	12,029,597	1887	23,461,850

THE VOLUME OF TRADE.

The Saint Paul Pioneer Press of December 25, 1887, contains a table in which there is an itemized account of the trade in each line of the jobbing business, which shows that during 1887 the aggregate sales amounted to $56,669,250, which was an increase over 1886 of $14,965,950. Among the leading articles of the jobbing trade the sales of agricultural implements, wagons, carriages, etc., amounted to $14,720,000; groceries, $9,443,000; dry goods, $5,869,500; hardware and stoves, $2,235,000; boots and shoes, $1,250,000.

This table does not include miscellaneous goods manufactured in the city and jobbed, which happens to be a good-sized item of $23,461,860; that portion of the flour product which is shipped out of the city, amounting in value to $21,005,582; the lumber product jobbed, amounting to $2,000,000, and the grain commission business of $90,000,000. If these be all added it gives a grand total of $193,136,682 for business which may be classed in a general way as wholesale, a business of which any city with a history scarcely covering a quarter of a century might well be proud. The total is $34,153,682 in excess of the 1886 total. This business gives employment to about ten thousand men.

BANKS.

Number of banks in 1887, 19. Increase of capital over last year, $745,000; increase of deposits, nearly $5,000,000; increase of loans, $3,866,768; during the four years in which figures were given to the public in regard to blank clearances the annual total jumped from $87,478,000 in 1883 to $194,267,737 in 1887.

POPULATION.

	Number.
1845	50
1850	2,500
1860	5,826
1865	8,101
1870	13,066
1875	32,493
1880	46,887
1885	129,200
1888 (estimated)	200,000

PART II.

COMMERCE OF THE MISSISSIPPI RIVER FROM SAINT LOUIS TO MEMPHIS.

By THEO. J. MCMINN, *Saint Louis, Mo.*

Hon. W. F. SWITZLER,
Chief Bureau of Statistics, Washington, D. C.

SIR: After my appointment, at your instance, as United States expert at this point for the collection and arrangement of information and statistics relative to the Mississippi River, its traffic and facilities for transportation between here and Memphis, Tenn., etc., I became deeply impressed with the magnitude and importance of the task, and while I am conscious of a faithful endeavor to discharge my duty I am aware that much is necessarily left undone, which, in the fullest justice to river interests, ought to be completed to the minutest detail. So far, however, as the facts and figures and data obtainable under the present appropriation and circumstances are concerned, the results are given with the confident belief that the demonstrated influence of the great river upon and its value to commerce will invite the attention of legislative bodies and insure generous, if not adequate, appropriations for its further improvement and the preservation of contiguous territory.

Facts—commercial, historical, and scientific—though often difficult of ascertainment and verification, are overabundant, and my effort has been more to simplify and condense and to keep within reasonable and readable bounds than to amplify at the risk of confusing and possibly wearying the investigator.

It is conceded by all interested in river transportation, and the weight of opinion has been ably expressed by men of such judgment and experience as E. O. Stanard, of Saint Louis, and Frank Gaiennie, the present able president of the Saint Louis Merchants' Exchange, that past river appropriations have been of incalculable benefit to Western interests, as will also appear by reference to resolutions adopted by various conventions and hereinafter set out.

It can not be denied—the Mississippi being unique and, without counterpart on the planet—that first expenditures were largely experimental, and some early attempts to control or even to influence the stream were expensive and rendered well-nigh fruitless. But experience and study have made comparatively plain, if not easy, the task of the engineer, and merchants entertain high hopes of the future greater usefulness of the great river as an outlet to the markets of the world and as a conservator and regulator of freight rates.

Up to date discussions in Congress, in conventions, in pamphlets, and on the stump have been almost wholly confined to the view taken from the standpoint of the great terminals—as Saint Louis, Saint Paul, New Orleans, and New York—and the arguments have deservedly carried great weight, but, after all, cities are only members of the body politic. The country and smaller interior points are entitled to some thought and consideration. As will be seen below, many towns on the river of considerable size and importance, and of influential, if not paramount aggregate, consequence, have no other means of access to the great trade centers, and many more have but one railroad, beside the water way.

In securing the information that follows I find myself indebted to books and people without number, but specially to Frank Gaiennie, E. O. Stanard, John A. Scudder, George H. Morgan, secretary of the Saint Louis Merchants' Exchange, Professor Waterhouse,

Professor Woodward, and L. U. Reavis, all of Saint Louis, and to various books on Western life, to histories of the Mississippi, pamphlets, speeches, letters, and convention proceedings.

Trusting that the report may be useful and meet your approval,

I have the honor to be yours respectfully,

T. J. McMINN.

SAINT LOUIS, MO., 1887.

THE MISSISSIPPI.

The name of the Mississippi River is of itself worthy of special note.* If France ever had sufficient title to the Mississippi Valley to convey ownership, she doubtless had authority to name the principal river; and if this follows, then the technically correct name of the great stream is Saint Louis, for in 1712 the King of France ordered in letters patent to Crozát that the river "heretofore called Mississippi be called Riviére Saint Louis."

But people resident along its banks and on the western continent gave no heed to the royal decree, though geographers like d'Anville adhered for years to "Saint Louis" as the proper name.

Mississippi is from the Ojibbeway tongue,† and signifies, according to Bishop Baraga, "Great River," or rivers or waters from all sides, or by liberal translation it may be interpreted as the savage vernacular for the national motto, *E Pluribus Unum.*

THE SKIFF, ROW-BOAT, AND BARGE.

The first commercial use of the stream was to carry the skin-laden skiff; and from that to the row-boat and the barge of the boatman the transition was easy; but little, however, is known of the quantity or character of traffic early in the century.

Before the time of steam the barge afforded the only means of river transportation, and the methods of its management were primitive, slow, and dangerous. The boat was 75 to 100 feet long; breadth of beam, 15 to 20 feet, and capacity 60 to 100 tons. The receptacle for freight was a large covered coffer called the cargo box, which occupied a considerable portion of the hulk. Near the stern was a small straightened apartment 6 or 8 feet in length, in which the captain and steersman or patron were quartered at night. Upon the elevated roof of this cabin the helmsman stood to direct the course of the craft. There were usually two masts; occasionally, one served the purpose. The main reliance was a large square sail forward, which, when the wind was favorable, accelerated the progress of the boat and relieved the hands, who at other times were obliged to propel it by most laborious methods. Going down the stream required watchfulness, some ingenuity, and full knowledge of the fitful and variable stream, but no exhaustive exertion. But up-stream, sometimes against the wind, through a land of savages, river pirates, and freebooters, the lot of the Mississippi navigator, in modern phrase, was not a happy one. About fifty men were employed. Sometimes all were rowing, sometimes they towed the boat after the fashion of the old canal-boat, but where the banks and stream made this impracticable the "warp" was adopted. This was accomplished by sending a coil of rope forward to some tree on shore or snag in the river, toward which the hands on board pulled the boat; then another tree or snag was selected, and so on to the end. There was little poling on the Mississippi—though it was sometimes done—on account of the depth of the water, the strength of the stream, and the yielding nature of the bottom. It was pole and warp, and tow and row, and row and tow, and pole and warp for months before a cargo from New Orleans reached Saint Louis.

BUCCANEERS OR RIVER PIRATES.

Buccaneers infested the mouths of the rivers; and the bays and creeks and caves af, forded places of concealment for them and their spoils till the close of the war of 1812- and every owner carried his own insurance against robber, flood, and fire. But it is recorded that the boatmen were scrupulously faithful to their trust and would fight to protect the consignment, and seldom failed to account satisfactorily for everything intrusted to their care; for policy doubtless had then as now much to do with business rectitude. The fates and fortunes of the traveler, however, who might have that about

---

* For an interesting account of the discovery of the Mississippi River by De Soto, in 1541, see Internal Commerce of the United States, 1886, pages 592–594.

† McCulloch says it is from the Algonquin.

him calculated to excite the cupidity of fearless and unscrupulous men who knew no law but their own wild wills, and who recognized no higher consideration than expediency, were not so secure, and many an untold tale of murder and mysterious disappearance lies at the bottom of the Mississippi, for waves never babble gossip and scandal. One of many instances must suffice:

Cotton Wood Creek and Grand Tower were well-known places of rendezvous for pirates who would attack voyagers from some such place, drive them off, and then appropriate their valuables.

Early in 1787 an event occurred which inaugurated severe measures by the Government, resulting in the dispersion of the pirates. One, Beausoleil, a New Orleans merchant, started for Saint Louis with a richly laden barge. A strong breeze arose as the vessel approached Cotton Wood Creek. The pirates were ready for an attack, but the swift progress under a stiff breeze frustrated their design, and they sent a body of men up the river to head off the prize. The point chosen for attack was an island since known as Beausoleil's Island, and was reached in about two days. The barge had put ashore and was easily captured and the crew disarmed, when the captors turned the boat down-stream, soon after which a happy deliverance came from an unexpected source. Casotte, a negro who had affected great pleasure at the capture, was used by the freebooters as cook. He kept up a secret understanding with Beausoleil, and at a given signal and opportune moment, the captured became the captors, and all the pirates were either killed or secured. Vigorous measures followed; trips were made in fleets well armed for fight, and within a short time the robber haunts were vacated.

In those days of flat-boats and barges and endless time, the freight rate from New Orleans to Saint Louis was $6.75 per hundred on a probable average, if it was not nearer the minimum.

FOUNDING OF SAINT LOUIS—HISTORICAL.

The original idea upon which Saint Louis was founded was commercial. The site was selected by one Laclede in 1764 as possessing peculiar advantages for the fur trade. The city is situated on the right bank of the Mississippi River, 18 miles below the entrance of the Missouri River, 182 miles above the mouth of the Ohio River, 148 miles below the Falls of Saint Anthony, 1,182 miles above New Orleans, and 150 miles below Jefferson City, on the Missouri, the capital of the State of Missouri. The confluence of the different rivers in the immediate neighborhood was the determining factor in the consideration of the trapper, and has beyond his foresight become of first importance as a center for the distribution of agricultural products, manufactures, and merchandise. The trapper builded wiser than he knew.

The statistics of early times for sixteen successive years, ending in 1805, show the average annual value of the furs collected at Saint Louis to have amounted to $303,750. The number of deer-skins was 190,000; of beaver 46,000; of otter 11,000; of bear 70,100; of buffalo 1,360. The city of Saint Louis then mumbered 1,500 inhabitants, more than half of whom were absent the greater part of the year on trapping expeditions. As late as 1820 the place boasted only 3,146 people.

In 1813 the first brick house ever built on the banks of the Mississippi was erected in Saint Louis. In 1817 the first steam-boat, the *Antelope*, arrived on her way to explore the Missouri, a stream then almost wholly unknown. In that year the value of the fur trade of the river was estimated at $600,000. In 1822 Saint Louis was chartered as a city under the title given by Laclede in honor of Louis XV of France. From 1825 to 1830 immigration to that city and contiguous territory became important, and Saint Louis commanded trade from New Orleans to the Rocky Mountains. In 1829 the keel boat disappeared and the steamers *Yellow Stone* and *Assinaboine* became the dominant features of river trade.

Situated as Saint Louis is, midway between the Ocean and the Lakes and the Gulf, the center of the greatest river system in all the world, Saint Louis can not fail to be and remain an unsurpassed commercial emporium, and the material interests of the great States lying in the Mississsippi Valley, assure her of paramount political weight and influence.

WESTERN NAVIGATION.

The river navigation of the West is unrivaled on the whole earth, and since the advent of steam Saint Louis is more truly a sea-port than New Orleans was before that date.

The advantages of this location, from a commercial and political point of view, have been so widely discussed and recognized that nearly every school-boy is familiar with the city, its history, present importance, and assured future greatness. The great river carries the product of every zone, from the frigid almost to the torrid. As a sea-port, in 1847, she collected about $50,000; in 1886–'87 over $1,500,000.

In about 1822 Thomas H. Benton, Missouri's great Senator, secured an appropriation, the first one from Congress, for the improvement of the Missouri River.

Of the power and propriety of making appropriations, Daniel Webster, in 1847, said:

"Of the power of the Government to make appropriations for erecting harbors and clearing rivers, I have never entertained a particle of doubt. This power, in my judgment, is not partial, limited, obscure, applicable to some uses and not applicable to others, to some States and not to others, to some rivers and not to others, as seems to have been the opinion of gentlemen. * * * For one I reject all such far-fetched and unnatural distinctions. In my opinion, the authority of the Government in this respect rests directly on the grant of the commercial power to Congress, and as this has been so understood from the beginning by the wisest and best men who have been concerned in the administration of the Government; and is consequently general, and limited only by the importance of each particular subject and the discretion of Congress."

Of the necessity for expenditure there are innumerable and unanswerable arguments from the eccentricity of the stream and its effects upon navigation; it is never the same yesterday, to-day, and forever. It is said that in former times conversation in Saint Louis could be carried on from opposite banks at East Saint Louis, and now the bridge is a mile in length. One of the early steam-boats was wrecked somewhere near Cairo. A sand bank gathered about the wreck; an island grew upon the sand bank; trees grew upon the island, and the timber was cut and used as fuel. Later the floods carried away the island and washed away the sand banks, and after twenty-five years the old hulk of the steamer was uncovered and recovered, and the divided stream united again in a deeper channel than had been formed on either side of the temporary island.

The width of the river increased between the years 1822 and 1874 from 50 to 250 per cent. One might say from 50 to 400 per cent., as the increase was even more than 400 per cent. in some instances in 1874. There was a measurement taken of the width for each four miles of the length of the river from Cairo to New Orleans with the following results:

Seven measurements ranged over 2 miles each; ten, over 1 mile each; ten that have not changed in width since 1821; seven that range from 1,400 to 1,900 each have been reduced from a greater width since 1821 in conformity to a natural law, as mentioned in our former article, that where a sedimentary river has more channel room than is required it deposits material until the channel way is reduced to the normal requirements of its volume.

There are seven measurements that range below 2,000 feet against 110 in 1821. The balance of the 257 measurements range from 2,000 feet to 1 mile. The difference between the widest and the narrowest points is from 1,400 feet to 14,000.

Steam-boat men estimate that an unimpeded river would lessen expenses one-fourth, and that with a deepened channel, full freights, and an adequate ocean tonnage the transportation of wheat from Saint Paul to Liverpool via the Mississippi would cost 8 to 10 cents less than shipments via New York.

Experts have declared that from Saint Louis to Cairo the depth should be uniformly all of 8 feet, and from Cairo down at least 10 feet.

Delays cost even upper-river steamers $16 per hour, and down-river, with larger cargoes and heavier expenses, could hardly get off with less than $20 per hour.

Mercantile experience seems to warrant the statement that 3⅓ mills per ton per mile on grain cargoes and heavy merchandise by river is a paying rate; the average freight rate for even through consignments is said to be from 1 cent to 1½ cents per ton per mile.

THE SAINT LOUIS BRIDGE.

The westward march of empire, the richness of the Mississippi Valley on both sides of the river, the growth and importance of Saint Louis, and kindred considerations, led to an early investigation of various plans for the erection of a bridge; the unmanageableness of the mighty volume at high water, the treachery of the ice-gorge in winter, and the variableness of the channel, as commerce increased and unrestricted intercourse became more imperative, necessitated action in the matter.

As far back as 1839 the building of a bridge was discussed; committees were appointed, reports made, plans submitted, and estimates arrived at, but the sum fixed as likely to cover the cost, $737,566, induced the then mayor, Dr. Carr Lane, to write: "The time is inauspicious for the commencement of an enterprise involving such an enormous expenditure of money."

In 1865 the necessity for a bridge had become so apparent that another investigation was had, and estimates made by the city council, when the probable cost was fixed at $3,332,200, but nothing immediate came of the effort further than the awakening of public attention and the demonstration that an adequate bridge would cost a vast deal of money.

The absolute necessity for a bridge had forced conviction into the right minds, however, and the Saint Louis and Illinois Bridge Company was organized as a result. But there was opposition from the ferry interests, litigation with a rival corporation, prolonged delay, and it was June 9, 1868, before the following board of directors was chosen: Charles K. Dickson, Barton Bates, John R. Lionberger, Amos Cotting, Gerard B. Allen, James B. Eads, Josiah Fogg, William Taussig, William M. McPherson, David Gillespie, and William R. Morrison. The executive committee consisted of Messrs. Taussig, Allen, and Lionberger. Capt. James B. Eads was selected as chief engineer, with Col. Henry Flad and Charles Pfiefer as his immediate assistants, Colonel Flad having charge of the mathematical investigations and calculations.

The river commerce being naturally divided into up-river and lower-river trade, the bridge was located at Washington avenue, so that the wharf might be equally divided and boats from neither direction be compelled to pass the piers. The structure was to be built with reference to the "city directrix," and this is a curbstone at the foot of Market street and marks the height of water in 1828, and serves as the datum-plane for all the city engineering. Thirty-four feet below the directrix is known as low water.

The velocity of the current where greatest, opposite Saint Louis, varies from 4 feet per second ($2\frac{3}{4}$ miles per hour) to $12\frac{1}{2}$ feet per second ($8\frac{1}{2}$ miles per hour) at high-water times. The average slope of the water-surface is about 6 inches per mile near Saint Louis.

From July, 1868, to April, 1869, but little was done toward building the bridge, as Captain Eads's health failed and he was sent to Europe; but public opinion was educated and the confidence of capital was secured, which resulted in pronounced activity after the latter date named. And there was need of activity, for contracts had been let in remote parts of the country; special makes of steel tubes and bolts were to be provided for; granite was to be obtained from the East; losses by flood and tornado were to be made good; mistakes necessarily incident to the performance of a task wholly without precedent were to be corrected; changes in detail were to be effected; extra masonry was to be provided for; models, tests, inventions, and a thousand unforeseen difficulties were to be inspected and managed; but courage, industry, and ingenuity triumphed over every difficulty, and on a cold and dismal day in October, 1869, the corner-stone of the east pier was laid. Steadily for five months day and night the unceasing work went on, until on the morning of February 28, 1870, the screaming of whistles and the booming of cannon announced that the pier rested upon solid rock 95 feet below the surface of the river. The west pier was begun January 15, and reached bed-rock April 1, and was filled with concrete and stood 86 feet deep in soil and water, completed June 8, 1870. The river-piers were built during that summer.

A complete and detailed account of the building of the great bridge would be impracticable within the limits of this report, but a glance at the history of commerce upon and over the Mississippi River would convey no idea of the magnitude and importance of that traffic, if I failed to note the time and money and genius required to perfect this magnificent means of transportation. As the stature and structure of a man may be judged by a single portion of his anatomy, so some impression of the value of the bridge may be obtained by a contemplation of a single feature of the structure. The east abutment is looked upon by engineers as a signal triumph of their art. It is without parallel on our planet, both as to total size and depth, the East River Bridge foundations at New York being greater only in superficial area. Professor Woodward, the historian of the bridge, says:

"It stands the deepest subaqueous foundation ever built. While the work was in progress it attracted much less attention than the channel-piers. No accidents, no delays, no insuperable obstacles were met; everything worked beautifully, and the cost and time were well within the estimates. One can point with confidence to the east abutment of the Saint Louis Bridge as the most brilliant example of deep foundations the world has ever seen, and though by the adoption of a similar plan it might readily be surpassed in mere magnitude, it will unquestionably mark an era in deep-water engineering."

It was not originally designed to sink this abutment to bed-rock, but the success of the plan adopted with the channel-piers demonstrated the feasibility of building the east abutment in the same manner.

In his report of October, 1870, Mr. Eads said:

"Beneath the masonry piers of suspension and truss bridges it is quite common to employ a considerable amount of timber. Where the pressure upon the pier is a vertical one, this economical substitute for stone is admissible; but in the piers of an arched bridge, where some one span is at times loaded while others are unloaded, the thrust of the loaded arch has a tendency to oscillate the piers, and with a few feet in thickness of a material so elastic as wood under their bases, this oscillation would prove a dangerous feature. In the abutment piers, where a thrust is from one side only, and oscillation

is prevented by the works on shore, timber may be safely used to a considerable extent. To give the desired stiffness to the caisson for this abutment and avoid the more costly use of iron the roof of the air-chamber is made of timber 4 feet 10 inches in thickness. A large amount of timber is also used in constructing and stiffening the sides of the air-chamber, which are 10 feet high, and in forming two horizontal trusses or girders through the air chamber. These two girders are each 10 feet thick at the top, 3½ feet at the base, and 9 feet in height. They are about 73 feet long and are interlocked at each end with the sides of the air-chamber. They divide this chamber into three nearly equal compartments in the direction of the length of the bridge. Communication is made between these compartments by means of two openings through each girder. The sides of the chamber are 8½ feet thick at the top and 18 inches at the bottom, and are composed of timbers, some placed vertically, others horizontally, and some inclined at an angle of about 45 degrees, and the whole including roof and girders thoroughly interlocked together and bolted with large iron bolts. All of the timber is of the very best white oak. In addition to the iron bolting used, these timbers are thoroughly secured together with large white-oak treenails."

Enveloping this entire wooden structure was a cover of plate-iron, with air-tight joints. This was ⅜-inch thick and its sides were increased in thickness at the bottom edge to 3 inches by riveting four ¾-inch plates together. These extended several feet up the sides. This iron edge extended 10 inches below the wooden sides and formed the cutting edge of the caisson. Every 2 feet the iron sides were strengthened by vertical angle-irons 3 by 7 inches in size, riveted flatwise to the outside of the caisson. Through these angle-bars bolts 1½ inches in diameter were inserted, and by them the iron and wooden sides were strongly held together. This iron covering extended over the wooden top of the air-chamber and formed a floor, on which masonry was laid. The lining of the three shafts sunk through this floor was tightly riveted to the iron flooring. Across the roof of the caisson and parallel with its river front ran two strong plate-iron girders. They were intended not only to stiffen the roof of the air-chamber, but to secure greater rigidity in the caisson as a whole during the earlier stages of the sinking process. The iron sides were carried up 15 feet above the roof and there stopped. The masonry above that point had no exterior envelope. Professor Woodward's account, from which this is taken, says "that, built upon ways like a ship, it was a strange-looking craft. A vertical wall of iron 30 feet high, surrounding a figure of irregular shape, was all that could be seen from without. From the top of the wall, to which ascent was made by a temporary flight of steps, the appearance was equally strange. Nothing but iron was visible. The iron girders, 13 feet high, separated what seemed to be an immense iron box into three irregular parts. In the floor of the central part was a large circular opening and shaft leading to the air-chamber. In another were two smaller openings leading to side shafts. The central shaft was 10 feet in diameter and communicated with a large air-lock on each side. The openings to the side shafts were 4 feet in diameter, but the shafts themselves below deck were 8 feet in diameter. All air-locks were 8 feet in diameter. The launch was most successful. The ways had been well tallowed, and when blocks and lashings were removed the monster hastened down the smoking slides and raised a prodigious wave as it struck the Mississippi. It drew about 11 feet of water, and was towed 7 miles in five hours to its position opposite the city."

Twelve days were spent in completing arrangements for laying masonry. On the 17th (November, 1870), when the first stone was laid, the river had fallen nearly 7½ feet, and one corner of the caisson touched sand. November 22 night-work was begun. When all the sand-pumps were at work the full complement of men in the air-chamber was: one man in charge, three foremen, and a gang of ten men in each compartment. They worked ten hours a day, and men were abundant. On December 2 the air-chamber men were divided into three watches, working eight hours each. The caisson settled from 1 to 1½ feet daily. On December 3 an explosion, or blow-out, occurred. Mr. McComas, the superintendent, said the sand in the central compartment had been excavated to a depth of several inches below the cutting-edge of the caisson, and that, as it was closely packed all round the outside of the caisson, it prevented the free escape of air under the edges, till the pressure inside was considerably greater than was due to the depth. Water had filtered in and had been pumped out by sand-pumps. Finally the air forced its way up through the sand, making a large passage of escape, through which a large amount of air worked out at once with comparative violence.

By December 9 the immersion was fully 30 feet, or to the top of the iron envelope; but the drift of the current and the yielding of the sand allowed the caisson to work its way from the shore about 3 feet on the north and 3 feet 5 inches on the south; and measures had to be invented by Captain Eads to counteract and remedy this drift. January 1, 1871, ice gave considerable trouble, and the caisson was not further settled till January 14, when it was settled 2 feet 8 inches, and ice again interfered with the work of the masons. New necessity was the mother of new inventions; the sand-pump and a lamp

for lighting a chamber of compressed air were two of Mr. Eads's inventions resulting from the necessities of the case.

On February 7, at an immersion of 70 feet, it was discovered that the men should be restricted to watches of two hours each, with a rest of four hours between. On February 26 it was determined to work the submarines only during the day, as the serious cases of paralysis occurred mostly in the night watches. At the east abutment there were 28 cases of sickness in the caisson and only one death; but in the grand total incident to the building of all the piers there were 119 cases, 14 deaths, and 2 men were crippled.

At 100 feet it was found necessary to shorten the watches to two, of forty-five minutes each.

On the 8th of March, 1871, occurred the great tornado. It came from the southwest and struck the east bank of the river with great violence, and for half a mile wrought incredible havoc. It fell with destructive force upon the derricks and engine-boats lying at the east abutment. Strong timbers were snapped like straws, and the wire ropes and cables were twisted into an almost inextricable mass. Hydraulic machinery, air pipes and hose, sand and water pipes, and all the intricate contrivances for pushing the work were crushed and scattered, but in all the crash and destruction in the midst of and over a hive of busy men, only one life was lost. Every engine was disabled, including the air-pumps to the caisson. The cost to the company was about $50,000.

But the hurricane had much to do with the present excellence and strength of the bridge. Captain Eads changed his plans. The original design contemplated an upper roadway wholly of wood, the substructure of which was designed to act as a truss to resist the action of hurricanes upon this part of the bridge. The possibility of a tornado like that experienced led to the consideration of a wind-truss in the form of a flat or horizontal girder 54 feet wide, extending from pier to pier made entirely of plate-iron, but this design was subsequently modified, resulting in an iron truss of great strength involving less material and weight.

After the tornado, with damaged appliances, the work was slow, but bed-rock was reached March 28 at 109 feet 8½ inches. The average depth of the rock below the city directrix (ordinary high water) was 127 feet 5 inches, and 135 feet below extreme high water.

Each pier had its individual history of delays, accidents, discoveries, and expenditures, and the east abutment, greatest in size of all, presents perhaps the minimum, certainly not more than the average, of incident, though greater in expense.

Table in regard to masonry.

[Detailed account of masonry in cubic yards.]

Abutments, piers, and approaches.	Granite.			St. Genevieve sandstone.	Grafton limestone.			Concrete.		Brick.	Total cubic yards.
	Richmond.	Portland.	Missouri red.		Cut face.	Behind skew-back.	Backing.	Shafts.	Air-chamber.		
East abutment	40.6	1,044.0	132.6	777.1	2,306.4	265.0	19,023.5	422	82	.....	24,093.2

Total	719.5	4,656.0	1,145.2	8,782.0	5,403.0	1,186.5	59,033.9	1,204	3,352	770.2	86,252.3
Add masonry in west approach between Third and levee	.....	.....	.....	.....	.....	.....	.....	.....	.....	.....	16,645.3
Grand total of masonry											102,897.6

Material in the superstructure.

	Pounds.
Steel: Total amount in bridge, about	4,780,000
Wrought iron: Total amount in three arches, about	6,313,500
Wood: Total amount in bridge, about	1,612,000
Railway tracks: Total weight, estimated at	430,000
Total weight of the three arches (or about 6,568 tons or an average of 4.3 tons per foot)	13,135,500
(The weight per foot near center of the span is about one-half of what it is at the ends.)	
Total weight of one naked rib	488,200
Length of rib of center arch, 531 feet; average weight per foot, about 920 pounds.	

Cost of the bridge.

Construction	$1,838,339.96
Erection and extras, etc	284,441.69
Total for superstructure	2,122,781.65
Foundation, approaches, etc.:	
West approach	433,524.75
West pier	463,712.67
West abutment	339,084.90
East pier	612,988.20
East abutment	664,130.60
East approach	741,419.47
Tools and machinery (less proceeds of sales)	336,910.74
Boats and barges	83,368.08
Repair account	99,998.44
Wooden buildings	30,685.98
Horse and balking account	21,400.78
Miscellaneous account	110,619.31
Contingent account	210,295.54
Engineering account	266,808.88
Grand total construction and erection	6,536,729.99

But the total cost of the bridge as given by Professor Woodward and as set out immediately above, only covers the items named, omitting right of way, discounts on bonds, salaries, and the like, and makes no mention of the tunnel, a necessary incident to the bridge as a means of transportation.

The right of way was obtained through a then very valuable section of the city, so that the sum total of all expenses up to the time the bridge and tunnel were in a condition to be used about doubles the amount above given—say about $13,000,000 or $14,000,000, as follows:

The bridge construction and erection cost (vide Woodward)	$6,536,729.99
Other items (salaries, etc.)	6,961,070.45
Tunnel	1,748,235.23
Grand total	14,245,035.67

February 27, 1867, a meeting of the Bridge Company was held at the Southern Hotel in Saint Louis, with Charles K. Dickson, James B. Eads, Joseph C. Cabot, John M. Krum, John H. Beach, and James Blackman present. March 23, at the Planters' House, the stockholders organized and elected C. R. Dickson, president, and James B. Eads, engineer-in-chief.

On February 25, 1868, the corner-stone of the western abutment was laid and the great bridge formally begun.

Early in June, 1874, General Sherman drove the last spike connecting the bridge with the railways on land. On the 29th of June a locomotive was run over both tracks. On the 2d of July fourteen engines tested the bridge, stopping in the center of each arch or span, and the upper roadway was filled with people and teams.

On the 4th of July, 1874, the triumphant completion of the bridge was celebrated, awakening profound interest and expressions of gratification all over the Union.

Between the east abutment there are three spans, the east and west, each 502 feet in the clear, the center span is 520 feet in the clear, which, with the east and west piers,

makes a total extent from abutment to abutment of about 1,575 feet. Counting the approaches, the total length of the bridge is 6,220 feet, or a little more than 1 mile.

As all the world knows, the bridge was a success and did not seriously hinder navigation, notwithstanding the fact that a grave and learned body of engineers sat upon the case, and pronounced against it, and declared it a menace to river traffic.

The language used was this:

"There can be no doubt that this bridge is an obstruction to navigation. What modification of the bridge will remedy this, is one of exceeding difficulty. If it should be proved that no change can be devised and carried out that will satisfy the interests of navigation without destroying the usefulness of the bridge, then justice demands the bridge must come down and a suitable one take its place."

Said General Warren, the spokesman:

"I am not indifferent to the importance to the public and to this city of having a reliable means of crossing the river at all times. I am not indifferent to the interest of those who have lavished their money in this undertaking; but a greater public interest should not be destroyed unnecessarily for their sake. I am convinced that a bridge suited to this great want, at an expense much less than has already been made, almost if not entirely unobstructing navigation, could years ago have been completed upon designs well known and tried in this country had not the authors of the present monster stood in the way."

Experience seems to have proven that the piers are, to an appreciable though not to a seriously hurtful extent, an impediment to navigation; that the draught is even improved; that the "monster" has become a protection in time of storm, beside being the means of unbroken and unrestricted traffic between the banks, and an indispensable method of uninterrupted travel. Boatmen learned that stacks could be both lowered and shortened to good advantage.

The traffic of the finished bridge was of course large from the first. I show the movement for different years, as will appear below:

The increase of travel and of freight traffic over the bridge is indicated by the following tables:

Number of railroad passengers crossing at the bridge at Saint Louis during each year from 1877 *to* 1887, *inclusive.*

Year ending March 31—	Number of passengers.
1877	604,483
1878	667,294
1879	719,178
1880	1,014,976
1881	1,083,892
1882	1,235,924
1883	1,213,021
1884	1,333,360
1885	1,282,430
1886	1,376,903
1887, year ending December 31, 1887	1,274,567

Number of freight and passenger cars which crossed the Saint Louis bridge each year from 1876 *to* 1887.

Year ending March 31—	Freight-cars.	Passenger-train coaches.	Stock-yard cars.	Total.
1875	29,008	.....	.....	29,008
1876	79,294	59,711	.....	139,005
1877	138,259	69,125	.....	207,384
1878	145,724	71,449	2,246	219,419
1879	186,311	76,846	3,349	266,506
1880	207,959	78,116	4,827	290,902
1881	243,704	88,998	4,734	337,436
1882	252,269	101,725	3,736	357,730
1883	278,144	105,073	3,042	386,259
1884	301,275	116,433	2,514	420,222
1885	318,904	113,863	2,642	435,409
1886	311,168	120,772	2,654	434,594
1887, year ending December 31, 1887	.....	.....	.....	469,661

These tables clearly indicate the rapid growth of the commerce of Saint Louis in an east and west direction.

The volume of traffic which then passed over the bridge was about 50 per cent. greater than the entire Mississippi River traffic of Saint Louis to and from the south. Besides this, a large amount of freight is transported across the Mississippi River in railroad cars on ferry-boats.

A considerable amount of freight also crosses in vehicles upon the wagon roadway above the railroad track.

Traffic and earnings in 1886 *and* 1885.

Freight cars:	
East	61,474
West	125,375
Total	186,849
Tons carried:	
East	731,970
West	1,877,951
Total	2,609,921
Empty freight cars carried:	
East	96,409
West	27,910
Total	124,319
Percentage of total freight-car traffic:	
Loads	60 per cent.
Empties	40 per cent.
Total freight earnings:	
1886	$863,579.23
1885	874,418.11
Decrease in 1886	10,838.88
Average earnings per car, $4.62; per ton, 33 cents; per 100 pounds, 1.65.	
Passenger traffic:	
Total number of railway passengers in 1886	1,376,903
Less D. H	105,410
Total paying passengers	1,271,493
In 1885	1,226,061
Increase	45,432
Average per day (including Sundays)	3,772½
Number of passenger coaches carried	86,748
Number of baggage, express, and mail	36,678
Total	123,426
Average number of passengers in coach	15.12
Total passenger earnings	$324,024.40
Total passenger earnings in 1885	325,622.58
Decrease in 1886	1,598.18
Average receipts per passenger in 1886 (cents)	25.48
Average receipts per passenger in 1885 (cents)	26.55
Decrease	1.07

SAINT LOUIS BRIDGE BUSINESS.

BUSINESS OF THE SAINT LOUIS BRIDGE, THE FERRIES, AND SAINT LOUIS TRANSFER COMPANY FOR 1886 AND 1887.

In connection with the business of the bridge and transfer companies, an estimate is given herewith of the amount of traffic across the Mississippi at Saint Louis. This estimate is made from such information as could be obtained, and, while not claimed to be correct, is probably a fair approximation of the business. The amount handled by private teams is an uncertain quantity which can not be definitely determined.

Amount of freight in tons transferred across the river at Saint Louis during 1887 *and* 1886.

SAINT LOUIS.

A brief summary of the city's earlier growth is outlined in the following schedule:

1764. February 15. Saint Louis established as a trading post by Laclede.

1771. Saint Louis taken possession of by Don Pedro Piernas. From this time till 1803 the city remained in possession of the Spaniards.

1803. Upper Louisiana transferred from Spain back to France, and in—

1804. March 10. All public property was turned over to the United States.

1808. First newspaper—Missouri Gazette—established.

1809. Saint Louis incorporated as a town.

1812. Territory of Missouri designated.

1815. First steam-boat arrived at Saint Louis.

1819. First steam-boat ascended the Missouri.

1821. Missouri admitted to the Union.

1822. Saint Louis incorporated as a city.

1830. Population increased to 5,862.

1835. Railroad convention held at Saint Louis.

1840. A thriving increase was exhibited. The city manufactured 19,075 barrels of flour, 18,656 barrels of whisky, and had 1,075 barrels of beef inspected.

1849. May 19. Disastrous fire swept away the main business part of the city, and during the following summer the city was visited by the dire pestilence of cholera.

1851. First railroad enterprise was inaugurated—the Pacific Railroad of Missouri, now the Missouri Pacific.

1855. First rail outlet to Atlantic sea-board—Ohio and Mississippi. From this time on the development of railroad interests was rapid, and the relative importance of river interests declined.

The population of the city, as showing its growth, is exhibited below:

Year.	Population.	Year.	Population.
1799	925	1844	34,140
1810	1,400	1850	74,439
1820	4,928	1852	94,000
1828	5,000	1856	125,200
1830	5,862	1859	185,587
1833	6,397	1866	204,327
1835	8,316	1870	310,864
1837	12,040	1880	350,522
1840	16,469	1886	450,050

During this earlier era the Upper Mississippi and Missouri Rivers formed almost the only feeders for the Saint Louis market, and the Lower Mississippi the most natural avenue of outlet for her products.

Prior to the year 1855 the commerce of Saint Louis was almost entirely dependent for the means of transportation upon the Mississippi River and its navigable tributaries. Beside the fluvial commerce of the city, there was a small trade carried on with contiguous territory by means of wagons. The commerce by river extended to Fort Benton, at the head of navigation on the Missouri River, to Saint Paul, at the head of navigation on the Mississippi River, and to Pittsburgh, on the Ohio River. The most important branch of the commerce of Saint Louis was, however, carried on along the Lower Mississippi, between that city and New Orleans. During the period referred to the commercial relations of Saint Louis with the cities of Pittsburgh, Cincinnati, and Louisville were both reciprocal and competitive. Her trade with New Orleans consisted mainly in the purchase of commodities imported at New Orleans from foreign countries or received from northern sea-ports, and the shipment to New Orleans of products of agriculture from the comparatively narrow strips of country bordering upon the Upper Mississippi and its navigable tributaries, which products found a market at Saint Louis. The lack of facilities for transportation then placed the principal part of the vast and productive area embraced in our Western and Northern States beyond the limit of profitable commerce. During this period the trade between Saint Louis and the States on the Atlantic sea-board was comparatively insignificant. The trade of New Orleans was then dominant throughout the States situated south of the Ohio River and south of the State of Missouri. Since the year 1855, however, the conditions governing the commerce of Saint Louis have been completely revolutionized. As the result of the construction of railroads, that city now enjoys extensive facilities for direct trade throughout the States of the Atlantic sea-board, the Western and Northwestern States and the southern States, and with the States on the Pacific coast. The centers of trade and of industry in nearly every State and Territory of the Union have thus been brought within the range of her commercial activities.

By the completion of the Ohio and Mississippi Railroad in July, 1855, Saint Louis secured her first all-rail communication with the Atlantic sea-board. A new era in the history of trans-Mississippi commerce was thus inaugurated. At once a large portion of the freight traffic between Pittsburgh, Cincinnati, and Saint Louis was transferred from the river to the railroad. There was also an almost entire diversion of the east and west passenger traffic from the Ohio and Mississippi Rivers to the railroad.

The upper river requires boats of light draught, drawing, when loaded, not more than 6 feet and capable of navigating with light trips in 3 feet of water. Such steamers are necessarily of smaller dimensions and lighter construction than lower-river boats, and have a carrying capacity of from 250 to 750 tons, or an average of 500 tons.

The commerce of the lower Mississippi is carried on large and strongly built steamers, capable of resisting the increased current, and on powerful tow-boats and barges; the steamers with a carrying capacity of from 800 to 1,500 tons, while a tow-boat with from five to eight model barges is capable of transporting 10,000 tons in a single trip, and occupying in the passage to New Orleans but six to eight days.

Another cause for the division of the river traffic is the fact that the reciprocal trade is between Saint Louis and the north, and between Saint Louis and the south. The shipper on the upper river terminates his venture at Saint Louis, where he disposes of his property and purchases the goods he desires in return, or receives the proceeds in money, with which to continue his shipments.

He has no business connections with the Southern States, has not the property in the shape and quantity to supply their wants, and must therefore dispose of his goods in a general market where there is a demand for the products of the North and Northwest. Therefore his venture must end at Saint Louis.

On the other hand, the trade of the South seeks a market where values are daily established, where orders can be promptly filled, where quantities and qualities desired can always be had, and where the exchange between the commodities of the South and the products of the North and West can be made.

Thus it will be seen that the division of the commerce of the great river is sharply defined by the natural conditions of the river and by the requirements of the people living and doing business on its banks and contiguous territory.

Up to about the years 1860 and 1861 the business of the Mississippi Valley depended for its transportation facilities almost entirely upon the Mississippi River and its navigable tributaries. Commerce flowed North and South, because there were no other means of communication.

With the advent of railroads reaching westward to and across the Mississippi River, tapping every prominent city and town, a portion of the traffic was necessarily and unavoidably diverted to east and west lines.

As the lines of railway were extended into the Southern States direct to interior points, affording quick transit for shipments, the larger portion of the business for these interior points was diverted from the river to the rail. Especially was this true of general merchandise and manufactured goods that could bear the expense of increased cost of freight.

The passenger traffic naturally sought the quicker route of travel, leaving to the river only the local travel between river points and the pleasure travel of the winter season.

What is commonly known as the "coast trade" or the trade along the banks of southern rivers is one of considerable magnitude, and forms a large portion of the business of the steam-boats. All along the Mississippi River from Saint Louis to New Orleans at varying distances from each other are large towns or cities on either bank of the stream, which are the distributing points for large sections of contiguous territory; among these may be named Chester, Ill., Cape Girardeau, Mo., Cairo, Ill., Hickman, Ky., Columbus, Ky., Memphis, Tenn., Commerce, Miss., Helena, Ark., Napoleon, Ark., Greenville, Miss., Lake Providence, La., Vicksburg, Miss., Grand Gulf, Miss., Natchez, Miss., Baton Rouge, La., and Donaldsonville, La. In addition to these prominent points there are 1,311 landings between Saint Louis and New Orleans at which steamers land, if desired, to receive and discharge freight. At a number of the cities named the Mississippi boats make connection and exchange freights with railroad lines extending into interior cities and also to sea-board points.

The first railroad connection below Saint Louis is Cairo, Ill., where there is an interchange of freight with the Illinois Central Railroad for Chicago and intermediate points, and with the Cairo Short-Line and Mobile and Ohio Railroad for Saint Louis.

Twenty-one miles below Cairo, and on the opposite bank is Belmont, Mo., where a branch of the Saint Louis, Iron Mountain and Southern Railroad reaches the river and makes connection with the system of railroads east of the river by car-transfer boat. When the river is closed by ice at Saint Louis, Cairo and Belmont become the head of navigation, and shipments for the south are made by rail to these points and there transferred to the river craft.

At Columbus and Hickman, Ky., Memphis, Tenn., and Vicksburg, Miss., the Mississippi River packets make connections with lines of railroad, and a considerable amount of freight is thus distributed.

THE COMMERCE OF SAINT LOUIS TOWARDS THE SOUTH.

In the following table the tonnage by river to and from the South embraces only tonnage moved on the Mississippi River below Saint Louis, the Cumberland and Tennessee Rivers, and the navigable tributaries of the Mississippi River which empty into it below the mouth of the Ohio River:

Tons of freight received at Saint Louis from the South, and of freight shipped from that city to the South, by river and by rail, from 1872 *to* 1887, *inclusive.*

Calendar year—	Received.		Shipped.		Total receipts and shipments.		Total.

1882	298,605	2,025,512	615,900	1,042,848	914,505	3,068,360	3,982,865
1883	374,920	1,984,541	593,615	982,544	968,535	2,967,085	3,934,610
1884	260,875	1,880,204	452,805	1,065,297	713,680	2,945,501	3,659,181
1885	259,915	1,894,326	474,685	1,066,039	734,600	2,955,365	3,689,965
1886	308,695	2,249,907	486,275	1,237,708	794,970	3,487,615	4,282,585
1887	297,550	2,624,331	560,150	1,413,426	857,700	4,037,757	4,895,457

It appears from the above table that the traffic of Saint Louis by river to and from the South increased from 850,767 tons, in 1871, to 914,505 tons, in 1882, an increase of 63,738 tons, or 7.5 per cent., but that the trade by rail increased from 954,565 tons, in 1871, to 3,068,360 tons, 1882, an increase of 2,113,795 tons, or 221 per cent.

During the year 1871 the movement by rail was only 103,798 tons in excess of the movement by river, but during the year 1882 the tonnage by rail was 2,153,855 tons in excess of the movement by river, and in 1886 the rail tonnage exceeded the water movement by 2,692,645 tons. This clearly illustrates the enormous development of the commerce of Saint Louis to and from the South by rail. After 1882 the traffic will be found also largely in the rail tables.

The total receipts from, and total shipments to, the South are shown as follows:

Calendar year—	Received.	Shipped.

SAINT LOUIS AS A TRADE CENTER—RAILROAD POSSIBILITIES.

[From the Saint Louis Republican, January 3, 1888.]

The geographical location and the natural advantages of Saint Louis are so thoroughly in harmony with the trade currents of the country that the accumulation and distribution of the several lines of trade and commerce should be upon a very much more extended scale the ensuing year than ever before, and with a proper appreciation of the relation this city sustains under the laws governing supply and demand to the territory rightfully tributary to this market, the volume of traffic movements in 1888 should reach very much nearer the capacity of our facilities than in any former year. But the possibilities of Saint Louis are one thing and the extent of their development is another, and both are altogether subject to and under the influence of the aspirations of her financial, commercial, and industrial interests. About 5,000 miles of new main-line road have been added in the past year to the railway system already having, or soon will have, Saint Louis for a common focus, and practically every mile of it has either opened up new territory to this market or given better facilities to communities that had already been provided with railway transportation, and the coming year will see the opening up of still other producing regions. The new year, therefore, opens with abundant opportunity for trade expansion, and for widening and strengthening the commercial influence of Saint Louis upon a territory that is as valuable as it is vast. But its output of produce and its commodity requirements will not voluntarily seek a permanent market here or at any other point. It must be demonstrated by the kind of energy and effort that "means business" that Saint Louis can and will make it to the interest of all newcomers, and old ones as well, to abide with us, commercially speaking, forever.

There will also be considerable for the Saint Louis merchants to do this year in the way of giving moral support to new railway enterprises that have this city for their objective point. The Saint Louis, Arkansas and Texas will extend northward during the year, and it would be a mistake to allow it to cross at Grand Tower and connect with the Illinois Central, for then it would be a Chicago, and in no sense a Saint Louis, road. The Venice and Marine project is another promising enterprise, the more so because it will open up extensive coal-fields and be a strong competitor of the Consolidated Coal Company. The Saint Louis, Kansas City and Colorado is now owned by the Atchison, Topeka and Santa Fé, and the work of extending towards Kansas will be begun this spring, but it must have terminal facilities in Saint Louis, and it should be seen that it has them. The Chicago, Burlington and Quincy is anxious to extend its line from Saint Peter's to Saint Louis, and to obtain an entrance to the center of the city. The Paducah extension of the Cairo Short Line should also be encouraged, as it means that ultimately it will be extended up the Tennessee River, and open up a very rich territory to this market. The construction of the Mobile and Ohio's proposed line from Corinth to Birmingham would be highly advantageous to Saint Louis and should be encouraged. So,

altogether the merchants of Saint Louis will find plenty to engage their attention the coming year, and it is to be hoped that every worthy undertaking that promises well for the trade and financial interests of the city may have the full measure of encouragement that they are deserving of.

A REMARKABLY GOOD SHOWING IN ALL LINES DURING 1887.

[Saint Louis Republican, January 1, 1888.]

The year's business throughout the manufacturing and mercantile lines of Saint Louis has been one of continued bustle and prosperity, and in all the various departments of trade the results have given satisfaction to those engaged therein. The bank clearings have increased from $810,800,000 in 1886 to $894,000,000 for 1887. In cotton the gross receipts of 1886 were 290,144 bales; 1887 shows 396,130 bales. One of our principal lines—that of lumber—increased fully 20 per cent. There was 250,000,000 feet of white pine alone handled, while in yellow pine, laths, shingles, and the different hard woods the totals increased in a like proportion. The receipts of grain were, wheat 13,607,175 bushels; corn, 16,074,511 bushels; oats, 9,418,335 bushels, which is considerably in excess of last year, and the consumption of coal was 5,000,000 bushels more than in 1886. The total receipts of live stock, as shown on the Chamber of Commerce books, were: Cattle, 464,828; sheep, 417,425; hogs, 1,052,240; horses and mules, 57,048 head. The manufacturers increased their output heavily. Agricultural implements, plate and sheet glass, fire-clay products, white lead and oil, building materials, boilers and machinery, beer, furniture and chairs, street-cars, flour, etc., all show an increase in the total production of from 20 to 33 per cent. Saint Louis makes more press-brick than four of the largest press-brick-producing cities together. The output was 50 per cent. greater than in 1886, and Mr. Eliot of the largest press-brick works here gave it as his belief that the 1888 output would be 100 per cent. greater than 1887.

THE TENNESSEE AND CUMBERLAND RIVERS.

These contribute no slight commerce to the great stream, but for about five months in the year navigation is always seriously hindered, and often wholly suspended by low water, the depth during the summer and fall not being reliably greater than 15 inches; particularly is this true of the Tennessee.

The bottoms of these rivers being rocky, there is no remedy but blasting, or canals and locks around the shoals, which would be expensive, between Waterloo and Florence, Ala., the shoals there extending for about 15 miles.

The difficulty of transportation makes an expensive difference in rates. During the present low water freight per barrel, for instance, is 70 cents, while with a good stage of water it is but 40 cents.

Different years show different states of trade; business is not uniform, and so the statistics are not available each year in the same form, or separately, except as set out in tables below, showing receipts and shipments by different river and rail routes, which are traceable through the tables down to 1887.

The commerce of Saint Louis, by river and by rail, during the years 1871 to 1887, is exhibited as follows:

Tons of freight received at and shipped from Saint Louis by river and rail from 1871 *to* 1887, *inclusive.*

Calendar year—	By river.	By rail.	Total.	Per cent.— By river.	Per cent.— By rail.
	Tons.	*Tons.*	*Tons.*		
1871	1,654,899	3,258,203	4,913,102	33.68	66.22
1872	1,669,201	4,043,028	5,712,229	29.22	70.78

1875	1,302,620	4,534,220	5,836,840	22.32	77.68
1876	1,288,980	5,091,170	6,380,150	20.20	79.80
1877	1,242,155	5,117,238	6,359,393	19.53	80.47
1878	1,329,375	5,665,866	6,995,241	19.00	81.00
1879	1,366,115	6,948,794	8,314,909	16.43	83.57
1880	1,931,385	8,852,204	10,783,589	17.91	82.09
1881	1,736,435	10,213,487	11,949,922	14.53	85.47
1882	1,571,985	10,649,782	12,221,767	12.86	87.14
1883	1,306,565	10,408,939	11,715,504	11.15	88.85
1884	1,035,260	10,052,206	11,087,466	9.36	90.64
1885	1,013,240	10,301,301	11,314,541	8.81	91.19
1886	1,132,100	10,728,110	11,860,210	9.55	90.45
1887	1,503,105	12,855,954	14,359,059	10.46	89.53

It appears from the foregoing table that during the year 1871 the tonnage moved by rail was twice as great as the tonnage by river, but that during the year 1882 the tonnage moved by rail was almost seven times as great as that by river. The river tonnage fell from about 34 per cent. of the total movement during the year 1871 to about 13 per cent. of the total movement during the year 1882. The rail tonnage, however, increased from 66 per cent. of the total movement in 1871 to 87 per cent. of the total movement in 1882.

The river tonnage increased from 1,654,899 tons in 1871 to 1,736,435 tons in 1881, but fell to 1,571,985 tons in 1882, a decrease from 1871 of 82,914 tons, or 5 per cent.; but the tonnage by rail increased from 3,258,203 tons in 1871 to 10,649,782 tons in 1882, an increase of 7,391,579 tons, or 226.9 per cent.

The total tonnage movement of the city increased from 4,913,102 tons in 1871 to 12,221,767 tons in 1882, showing an increase of nearly 150 per cent. So large an increase in the magnitude of the traffic of a great commercial city is a matter of great moment in so far as relates to the growth of the city itself, but in the present instance it assumes a higher interest, as an illustration of the development of the resources of the extensive section of the country of which Saint Louis is the chief commercial city.

Receipts by river in tons, 1885.

As shown by the report of Mr. George H. Morgan, secretary of the Merchant's Exchange last year, the business of the city, as indicated by the number of tons of freight moved, which included through business, shows an increase, comparing with the two previous years, as follows:

	1886.	1885.	1884.
Freight by rail and river:	*Tons.*	*Tons.*	*Tons.*
Received	7,681,225	7,243,233	6,961,137
Shipped	4,178,985	4,071,308	4,126,329
Total	11,860,210	11,314,541	11,087,466

The returns of the clearing-house for the year also show that the volume of business has increased the aggregate clearings being $3\frac{8}{10}$ per cent., or $51,664,637 in excess of the previous year.

Thus, notwithstanding the unfavorable conditions which hampered business, we have made progress, and the outlook for the future is promising.

With favorable transportation rates, removing all discriminations, and giving our city

proper recognition as a great commercial center, we may confidently expect to permanently hold a prominent place as a grain, provision, and cotton market, as well as a jobbing and manufacturing center.

Comparative business in leading articles at Saint Louis for 1884, 1885, 1886, *and* 1887.

Aggregates	894,527,731	810,795,062	138,859,722	149,968,903

Increase of clearings in 1887:
Clearings, 10.3 per cent..... $83,732,669

The clearings of 1887 are the largest of any year since the operations of the clearing house.

THE RIVERS.

The city of Saint Louis is situated on the Mississippi River, 809 miles south of the Falls of Saint Anthony, Minnesota, and 1,242 miles north of the city of New Orleans, and 1,342 miles from the jetties at the mouth of the river.

The Missouri River enters the Mississippi 21 miles above Saint Louis, and the Illinois River joins the Mississippi 24 miles above the mouth of the Missouri. Saint Louis is, therefore, located practically at the confluence of the Mississippi, Missouri, and Illinois rivers.

The transportation interests of the great river are practically divided into two parts, known as the Upper Mississippi and Lower Mississippi. Saint Louis is, and always will be, the dividing line, where the commerce of the upper river terminates and the commerce of the lower river originates.

The river commerce of the Mississippi Valley has undergone many changes in the past twenty years. A casual observer, looking at the river front of this city, and contrasting the evidences of business with those of earlier years, might be inclined to think that river traffic was a thing of the past and the glory of the Mississippi steamer had entirely departed.

But it must be remembered that the methods of doing business have also undergone a great change.

In the early days, before the era of elevators, river warehouses, and wharf-boats, all the freight coming by river was carried from the boat to the levee and piled upon the bank, and it was not an uncommon thing to see the Saint Louis levee completely covered with all kinds of freight from one end to the other, and forty, fifty, or more steam-boats at the landings. But now the expenses of handling freight are minimized; grain delivered at the elevators; flour, provisions, and many other articles at the warehouses on the river banks; lumber direct at the yards on the river front in the northern portion of the city, and miscellaneous freight on the wharf-boats.

Again, it must be remembered that the whole length of the river front from the extreme northern city limits, which is about a mile above the grand chain, to the river Des Peres—the southern city limits—is 19 miles. Of this front the central portion, from Chouteau avenue to Biddle street, twenty-four blocks; from Chambers street to Dock street, ten blocks, and from Angelica to Ferry street, three blocks, is improved and paved, making thirty-seven blocks or 2.3 miles of river front suitable for the handling of freight. The unimproved portion is also used in the handling of lumber and logs and other non-perishable freight.

When this is contrasted with the limited space, say some ten blocks of frontage, on which all the river traffic was handled in the early days, it will be better understood why the levee does not present the seeming activity of former days.

The character of river craft has undergone a great change. Steamers are now of greater capacity, and tow-boats propelling large barges, carrying sometimes in one tow 10,000 tons of freight, do a large portion of the business.

These boats and barges, owing to the improvement of the channel by the General Government, are enabled to load to a depth of 10 feet, except in seasons of extreme low water.

Formerly the river between Saint Louis and Cairo offered the greatest obstructions to navigation southward, on account of Horse-Tail and Twin-Hollow Bars, the former 5 miles and the latter 19 miles below Saint Louis. Since the improvement of these bars the channel out to Cairo has averaged 10 to 20 feet, except as before stated, in extreme low water, enabling the Southern packets and the barge line to load to their full capacity. During the latter part of the past season, when the stage of water was unusually low, the water on these bars was 3 to 4 feet deeper than at some other points, and had these improvements not been made these bars would have virtually made navigation southward impossible.

The character of the freight transported by water has also changed materially. Up to about the year 1860 the business of the Mississippi Valley was almost exclusively carried on the great rivers, for the reason that the rivers afforded the only means of transportation. But with the advent of railroads reaching westward to and across the Mississippi River, a portion of the traffic was necessarily diverted to east and west lines. In the same way the trade of the South was diverted to a considerable extent to rail lines reaching direct to the interior cities, and affording quick shipment for general merchandise. The cheaper and more bulky freights, that are moved in large quantities and can not bear the increased cost of rail transportation, still seek, whenever practicable, the water routes. Passenger traffic naturally sought the more rapid means of conveyance, leaving to the rivers only the pleasure travel southward in winter and northward in summer.

But with the diversion from the water route of what may be called the distributing trade of the lower river, came the through foreign grain movement, via New Orleans and the jetties.

The opening of the mouth of the Mississippi River by Capt. James B. Eads, of Saint Louis, gave to the Mississippi Valley an outlet for its surplus products to the markets of the world, and made good to the commerce of the lower river the loss it had sustained by the diversion to rail lines of the local or distributing trade.

Saint Louis is the dividing line where the commerce of the upper river terminates and that of the lower river originates. In the lower trade there are two distinct classes of commerce, namely, the coast or distributing trade and the through grain trade. The former has largely declined, but the loss has been made good by the through foreign movement of cereals via New Orleans and the jetties. The construction of the jetties gave to the Ohio, Mississippi, and Missouri valleys an outlet for their surplus products to the markets of the world.

The trade of Saint Louis with the Lower Mississippi country is well served by two regular lines, running to New Orleans and intermediate points.

The Saint Louis and New Orleans Anchor Line consists of the following large and commodious steamers:

Steamer.	Running to—	Steamer.	Running to—
City of New Orleans	New Orleans	*City of Vicksburg*	Vicksburg.
City of Saint Louis	Do.	*City of Providence*	Do.
City of Natchez	Do.	*Arkansas City*	Do.
City of Baton Rouge	Do.	*Belle of Memphis*	Do.
Annie P. Silver	Do.	*Will S. Hays*	Do.
City of Cairo	Vicksburg.	*E. C. Elliott*	Grand Tower.

The Saint Louis and Mississippi Valley Transportation Company, commonly known as the Barge Line, running to New Orleans, is composed of the following powerful towboats:

Jay Gould, Future City, Sidney Dillon, R. S. Hays, Port Eads, Henry Lowrey, Oakland, John Gilmore, My Choice, E. M. Norton, and John Dippold, and ninety model barges with the combined capacity of 118,000 tons, capable of moving monthly to New Orleans 2,500,000 bushels of grain or 90,000 tons of miscellaneous freight.

In addition, there are a number of independent boats running in the lower river trade which make occasional trips to Saint Louis, among which may be mentioned the *A. J. Baker, S. C. Baker, Helena, Chas. P. Chouteau, Chas. Bowen No. 2, General Lysle, M. M. Michael, Pearl, Nick Sauer, D. C. Fogel, Minnetonka, La Mascotte*, and *Clyde*. In the Red River trade the *D. R. Powell* has made weekly trips during the past season.

The Ohio and Tennessee River trade is represented by the following steamers and towboats plying regularly between Saint Louis and the points named:

Name of boat.	Name of packet companies.	Running to—
Iron Sides	Gray's Iron Line	Pittsburgh and Wheeling.
Iron Duke	do	Do.
Alice Brown	Brown's Line	Do.
Harry Brown	do	Do.
Jos. Walton	do	Do.
Coal City	do	Do.
H. F. Frisbie	Tow Boats	Do.
Shiveley	do	Do.
Chas. Clark	do	Do.
Silas P. Coe	do	Do.
Edith	do	Do.
Hudson	Saint Louis, Ohio and Tennessee River Packet Company.	Evansville.
W. F. Nisbet	Evansville, Paducah and Tennessee Company.	Cumberland and Tennessee River.
John Gilbert	do	Do.
City of Florence	Saint Louis and Tennessee River Packet Company.	Do.
H. A. Tyler		Do.

As significant of the demands of Southern trade the following tables are p ertinent:

SHIPMENTS AND RIVER CONDITIONS.

During the years 1886 and 1887 the amount of freight in tons received at and shipped from Saint Louis by the rivers by boats and barges, not including receipts by rafts, was as follows:

	1887.		1886.	
	Received.	Shipped.	Received.	Shipped.
Upper Mississippi River	132,400	36,070	140,880	46,190
Lower Mississippi River	268,735	538,065	173,610	431,945
Illinois River	78,560	7,125	88,010	5,175
Missouri River	27,700	14,580	32,620	24,255

While the railroads have absorbed to a great extent the carrying trade of the country, it is an admitted fact that the great lakes and the Mississippi River and its tributaries exert a powerful influence as arbiters of freight rates. It is, therefore, the duty of the great cities on the lines of water communication to sustain the water routes by all legitimate means, as one of the agencies whereby cheap freights can be obtained for the moving of the products of the country, for the cost is lessened not only on the amount carried by the water ways, but also on the proportion carried on competing lines of railroad.

During the winter of 1885–'86 the Mississippi River at Saint Louis was closed by ice for fifty-five days, viz, from December 10 to 23 and from January 7 to February 16. On the latter date navigation southward was resumed. From the north the Alton packet resumed her trips on February 26, and on March 1 the *General Meade* arrived from the Missouri River, and on March 4 the *Calhoun* came in from Naples, on the Illinois River. The first arrival from Keokuk was the *White Eagle*, on March 21, and from above the rapids the *Libbie Conger* from Dubuque on April 1, when navigation on all the routes was resumed for the season.

The upper river boats ceased their trips, as usual, on November 15, and all up-river navigation was practically closed by the end of the month. On December 1 the river closed opposite the city, but opened again from the 10th to the 24th, and then closed and so remained to the end of the year.

There were a few days in December during which the river was open to Cairo, but as only 4 feet of water was reported near Grand Tower, and the danger of the river being soon again closed by ice was imminent, the steam-boat and barge lines did not attempt to resume business, and navigation was practically closed during the whole month.

The stage of the river was unusually low, there being no June rise, and from June 1 to December 31 was lower than perhaps ever before during the same months. The ben-

efits of the work done by the Government, under the direction of Maj. O. H. Ernst, in improving the river, was practically demonstrated during the year, as pilots reported 3 to 4 feet more water at points where the work had been carried on than at other points.

The stage of the river out to Cairo, as reported by Capt. James Good, superintendent of the Saint Louis and Mississippi Valley Transportation Company, was as follows:

Stage of water out to Cairo during 1886.

	Feet.		Feet.
January 1 to 10	10	July 1 to 20	8
January 10 to 31	(*)	July 20 to 31	6
February 1 to 15	(*)	August 1 to 31	6

June 15 to 20	13		

* Navigation suspended by smoke.

For the past twenty seasons navigation southward has been suspended on account of ice as follows:

	Days.
1865–'66, from December 15 to January 12	27
1866–'67, from December 26 to February 3	38
1867–'68, from January 8 to February 18	40
1868–'69, open all winter.	
1869–'70, from December 21 to 28	7
1870–'71, from December 21 to January 23	32
1871–'72, from December 1 to 18 and from January 30 to February 24	42
1872–'73, from November 29 to January 20	51
1873–'74, open all winter.	
1874–'75, from December 30 to February 27	58
1875–'76, open all winter.	
1876–'77, from December 8 to February 5	58
1877–'78, open all winter.	
1878–'79, from December 16 to January 29, and February 14 to 17	46
1879–'80, from December 17 to 31, inclusive	15
1880–'81, from November 18 to December 5 and from December 7 to 14 and from December 24 to February 18	78
1881–'82, open all winter.	
1882–'83, from December 7 to 23 and from January 1 to February 13	29
1883–'84, from December 18 to February 5	48
1884–'85, from December 19 to 30 and 35 days in January and February	47
1885–'86, from December 10 to 23 and from January 7 to February 16	55
1886–'87, from December 1 to 14 and from December 24 to January 27	49
1887–'88, from December 19 to January 31	43

The river tonnage of the year shows an increase, which, considering the low stage of water that prevailed, is very gratifying, and compares with other years as follows:

	1887.	1886.	1885.	1884.	1883.	1882.
By steamboats and barges:	*Tons.*	*Tons.*	*Tons.*	*Tons.*	*Tons.*	*Tons.*
Received	652,880	570,205	479,065	520,350	629,225	802,080

*No freight received by this road for any year except 1887.

In addition to the receipts by boats there was received the following tonnage of lumber, logs, and shingles by raft:

Year.	River.	Tons.
1880	Upper Mississippi	198,315
1881	do	356,020
1882	do	271,490
1883	do	228,950
1883	Missouri	2,335
1884	do	1,335
1884	Upper Mississippi	238,995
1885	do	251,665
1885	Missouri	2,195
1886	Upper Mississippi	200,725
1886	Missouri	60

Statistics not obtainable for 1887.

* Via Belmont and Cairo during January and December.

The general growth of business east and west is indicated by the traffic of the Wiggins Ferry Company; it will be remembered that the bridge was finished in 1874.

Number of cars handled.

Year.	Loaded cars.		Empty.
	East.	West.	
1883	7,475	34,491	32,160
1884	10,154	30,235	36,120
1885	10,397	41,588	37,090
1886	6,915	41,257	38,210

Also for 1887: total number of cars east and west, 18,769; empty, 16,410.

FOREIGN COMMERCE.

The total export trade of 1885, the movement via New Orleans and via Atlantic seaboards, taken as a whole, was less than for any previous year since its inauguration. The amount of grain reported via New Orleans was greater than in 1884, but less than in 1883, while the movement via Atlantic ports was but about 35 per cent. of the amount forwarded in either of the two preceding years.

The decrease was principally in cotton, wheat, and flour. In the former, Saint Louis participated in the small export movement of the year, while in the matter of breadstuffs the decline was due principally to the almost total failure of the winter wheat crop of 1885.

Saint Louis being a large consuming market for wheat, and the crop tributary being a failure, a large amount was brought from Indiana and other points not usually tributary to this market to supply the home demand. This, with the fact that a large amount was held for delivery on year and later contracts, kept prices relatively higher than at other points, and too high for export demand.

The movement by the Mississippi River or the "jetty route" was therefore confined principally to corn, of which 8,180,037 bushels were shipped for export, or about 13 per cent. of the total amount exported from the United States—nearly double the amount taken in 1884, and almost equaling the movement of 1883. The export of corn from the

United States and from the principal seaboard cities for the past two years was as follows:

From—	1885.	1884.
	Bushels.	*Bushels.*
New York	26,259,228	11,905,725
Baltimore	13,752,196	4,993,759
New Orleans	7,825,641	4,425,940
Philadelphia	6,028,564	1,750,266
Boston	3,647,244	5,696,755
Other ports	5,012,869	4,215,767
Total from United States	62,525,742	32,988,212

It is gratifying to note from these figures that the "jetty route" maintained its position and that New Orleans stood only third on the list. When trade is in a normal condition the river route to the sea will take its full share of the surplus products of the Mississippi Valley for shipment to foreign markets. The supply of tonnage at New Orleans was ample and vessels received full supplies of freight at remunerative rates.

The foreign trade of the year 1886 shows a slight decrease over 1885, the deficiency being in the shipments via the eastern seaboard. The movement of bulk grain via New Orleans was slightly in excess of either of the two preceding years, and included a greater proportion of wheat than heretofore. The movement in corn was large, and would have been considerably increased had it not been that the river was closed by ice during the month of December.

The river route held its own, and New Orleans still ranks third in the list of grain-exporting ports.

The shipments of corn for the past four calendar years from various ports were as follows:

From—	1887.	1886.	1885.	1884.
	Bushels.	*Bushels.*	*Bushels.*	*Bushels.*
New York	12,347,567	20,504,141	26,259,228	11,905,725
Baltimore	7,158,432	14,076,379	13,752,196	4,993,759
New Orleans	7,475,826	8,299,857	7,825,641	4,425,940
Philadelphia	2,176,107	1,923,862	6,029,564	1,750,266
Boston	2,227,242	3,210,199	3,647,244	6,696,755
Other ports	4,193,898	8,668,753	5,012,869	4,215,767
Total from United States	35,579,072	56,683,191	62,525,742	32,988,212

The decrease in the exports of corn and corn meal was 35 per cent. There was, however, an increase of about 17 per cent. in wheat and flour; so that, in the aggregate, breadstuffs show an increase of about 7 per cent.

Tobacco fell off 17 per cent., but there was a slight increase in provisions.

The shipments here given represent only those forwarded on through bills of lading. A large amount goes to the seaboard cities on local bills of lading, of which no report can be given.

SAINT LOUIS COTTON MARKET.

The cotton business of the year 1886 was very satisfactory, the gross receipts having reached 472,682 bales, an increase of 62⅔ per cent. over the preceding year, while the net amount handled by our factors was 226,665 bales, an increase of 20¾ per cent.

These figures are very gratifying, and demonstrate that Saint Louis not only retains her hold upon this important part of her commerce, but every indication points to a large increase in the future. The principal sources of supply are the States of Arkansas and Texas. As these two great States develop their agricultural resources, their cotton crop will largely increase and Saint Louis will continue to be the point where the cotton will be marketed. Of the gross receipts of the year, 226,496 bales came from Arkansas, 211,046 bales from Texas, 9,726 bales from Missouri, and 2,802 bales from the Indian Territory, a total of 450,070 bales from west of the Mississippi, while from States east of the river there were received 22,612 bales, of which 10,176 bales came from Tennessee, 10,656 bales from Mississippi, 1,674 bales from Kentucky, and 106 bales from Louisiana.

The amount exported to Europe was less than in either of the two previous years, reaching only 89,609 bales, of which 86,121 bales went to England, the shipments eastward by rail, for consumption mostly, were 353,040 bales.

The stock on hand at the close of the year was 9,924 bales, a larger stock than ever before carried over into a new cotton year.

Saint Louis still enjoys superior advantages for the economical and careful handling of cotton, the warehouses being located alongside of the railroad tracks and on the river banks, thus avoiding drayage and damage.

Table showing the gross and net receipts of cotton at Saint Louis.

Cotton by rail to Liverpool, compress included, costs about $3 per bale; rates vary slightly, but shipments are not made from Saint Louis by all-water route to Liverpool.

A practical railroad man recently said in the Saint Louis Globe-Democrat:

Saint Louis merchants are slow to catch on. Some never do. Ever since March, rates from Saint Louis to Missouri Pacific local stations between Kansas City and Omaha have been the same as from Saint Louis to Kansas City, Saint Joseph, Atchison, Leavenworth, or Omaha. The Missouri Pacific tariffs give Saint Louis an advantage over the Missouri River cities of from 8 cents to 15 cents on fourth class; 20 cents to 40 cents on first class, and proportionate advantages on other classes. The advantage is equivalent to the local rates paid by Missouri River jobbers. The Saint Louis jobber pays 87 cents on dry goods from New York to Saint Louis, and reships to, say, Hiawatha, for 70 cents, making $1.57 through. Now, the Kansas City jobber pays $1.57—New York to Kansas City, and reships, paying about 30 cents, or $1.87 through. The "Missouri River" tariff of the Pacific road is a good thing for Saint Louis, if her drummers knew how to show up the advantages in rates; but they don't, and in consequence Missouri River jobbers are doing most of the trade. If Saint Louis merchants will acquaint themselves with the advantages—post their drummers, and give the territory special attention—they will get that trade in spite of anything the Missouri River cities can do. The tariff gives Saint Louis relatively the same advantage over Kansas City that New York would have over Saint Louis, if the New York rates to all points in Missouri were the same as the rates from New York to Saint Louis.

SAINTE GENEVIEVE, MO.

Population, 1,600; county, 11,500; 2 flouring mills; 20 flouring mills in the county established in 1856 and 1883. Cone Mills turned out in 1886 30,500 barrels; and Saint Mary's about same quantity; capital invested, about $100,000. Cone Mill ($40,000) owned in Saint Louis; product sold mainly in Saint Louis; 40 per cent. of product consumed in the State; 80 per cent. goes to Saint Louis and 20 per cent. to New Orleans and Memphis—all by river route; about $25,000 paid in wages per year; close of the river shuts off shipments, and if protracted stops manufacturing. From the south about 250 tons of salt and cement was received in 1886, worth $2,500; from the north 1,000 tons of dry goods and groceries, lumber and farming implements, worth $250,000; about 250 tons of corn was shipped south, worth $2,000; about 4,000 tons of flour, bran, wool, poultry, cattle, hogs, and clover seed were shipped north, worth $200,000; no rail traffic; freight $3 per ton to and from Saint Louis, except flour at $2.50. There are 5 dry-goods houses, 2 millinery stores, 3 grocery stores, 3 agricultural implement stores, 2 stove and tin stores, 1 sewing-machine store, 2 printing establishments, 2 merchant flouring mills, 3 churches, 2 public-school buildings, 1 convent, and 2 parochial schools.

The western part of this county, being nearer to the Iron Mountain Railroad than to the river, uses the railroad as a means of shipping and receiving their supplies.

From 1872 to 1885 a large amount of copper ore was mined, smelted, and refined at this place.

Since 1885 nothing has been done with the mines, but there is a prospect that in the near future work will be recommenced, as the mines are not considered exhausted.

For a number of years the sandstone quarries, about 4 miles south of this city, were extensively worked, but the difficulty and expense of getting the product to market has caused a suspension. Should the projected railroad from Saint Louis to Memphis be built it would pass through these quarries and enable them to recommence work.

The Saint Louis Bridge, Equitable Insurance Building, and Singer Building, in Saint Louis, and State Capitol, Des Moines, Iowa, are built of this stone.

Previous to the settlement of *le vieux village de Sainte-Geneviève*, De Soto, with his Spanish cavaliers and miners in search of gold, as early as 1541, fifty years after Columbus discovered America, had visited the Sainte Genevieve district, and the spurs of the Ozark Mountains of Missouri. Francis Renault, of France, agent of the Company of the West, established himself near Fort Chartres, Ill., with his 200 miners and 500 slaves in the year 1720. Immediately he crossed the Mississippi River, and overran the district of Sainte Genevieve, with his miners and slaves, and commenced mining for the precious metals, succeeding only in discovering lead mines, and to this day can be seen the marks and diggings over this whole district of his exploring mining operations. Renault's only success was the smelting of lead, which was conveyed to Fort Chartres on pack-horses until 1735. After this the depot of mineral was made at *le vieux village de Sainte Geneviève.*

The original Sainte Geneviève was known by the name of "Le Vieux Village" (the old town), was located about 3 miles south of the present Sainte Genevieve, in what is known as "Le Grand Champ" (the big field), and was settled in the year 1735, being the oldest settlement in former Upper Louisiana, a portion of which is now Missouri, west of the Mississippi River. The old town was abandoned in 1785 on account of the great flood of the Father of Waters during that year, and known among inhabitants as "l'année des grandes eaux" (the year of the great waters), which destroyed all the settlements and the improvements in the lowlands of the valley in its mighty sweep to the Gulf. Originally this le grand champ contained about 4,000 arpents of land, all under one fence, and cultivated in common by the inhabitants, but now diminished to 3,000 arpents, caused by the encroachments of the river. *Le grand champ* (the big field) is one of the most beautiful and fertile bottoms of land on the face of the globe, and is every year decorated by the richest profusion of products which furnishes most of the necessities of life to the inhabitants of Sainte Genevieve, and also gives employment to a great number of its citizens in the cultivation of its rich and inexhaustible soil.

The present town of Sainte Genevieve is beautifully located on the verdant banks of the grand Mississippi, about 60 miles below the future great city of the world, Saint Louis, and sits in beauty amid surrounding and smiling hills. The town of Sainte Genevieve was first settled by French emigration in 1785, as before stated, by the inhabitants of le vieux village de Sainte-Geneviève (the old village of Sainte Genevieve), Cahokia, Kaskaskia, Fort Chartres, and other settlements of Illinois, on account of the great flood of that year, which induced them to seek safety here against calamities of that character in the future. The overflow of the Mississippi in the year 1785 has never been equaled since in its fearful waste of waters, for the valley was one vast sea from bluff to bluff, and presented a sight never to be forgotten by the many to which it brought desolation and destruction.

THE INDIANS.

The Indians who inhabited the immediate vicinity of the town of Sainte Genevieve at the time of its early settlement were a tribe of Peorias encamped south of the town along the bluffs that front the "big field." They were the remnants of a warlike tribe of the Illinois, and warm friends and strongly attached to the French inhabitants, who afterwards protected them from the neighboring Indians and marauders. In the district of Sainte Genevieve during the occupation of the French and Spanish government there were many Indian villages. One they called Le Grand Village Sauvage (the big Indian village), was south of Sainte Genevieve, and contained about 500 inhabitants, and was built on what is called La Petite Rivière à la Pomme (or Apple Creek), and now lies within the borders of Berry County. This village was located on the north of the creek and occupied by a tribe called Chawanons. They were industrious and brave. Their cabins were constructed of solid logs, and well cemented with a greasy dirt and other materials, which effectually protected them from the inclemency of the weather. They possessed many horses, keeping a large number of them on hand in case of attack by other warlike bands of savages who roamed through the country. The Chawanons were a tall, finely developed, and robust-looking people. Their women were pretty and exceeding swift of foot, and in dress were decorated with the most brilliant feathers, silver trinkets, etc. They cultivated corn and other products of the field, and were far more civilized than the generality of the other Indian tribes in Upper Louisiana. They worshipped the Great Spirit and believed after death that an abundance of all earthly things awaited them beyond the dark river.

The sister of the great Indian chief Tecumseh resided there. She was remarkable for her beauty and intelligence, and whilst on a visit to some neighboring tribes at New Madrid, Mo., became acquainted with and enamoured of a French creole by the name of François Maisonville, and shortly afterwards they were married according to Indian custom. Tecumseh, having visited Upper Louisiana immediately after the marriage for the purpose of exciting the various tribes to war, heard of it and became fierce and indignant, and forced his sister to return to Apple Creek village, where she remained for some time, but soon returned to her husband after Tecumseh left. They resided many years in New Madrid and raised a large family. Some of their descendants are now living there.

POPULATION AND COMMERCE OF SAINTE GENEVIEVE.

The census taken by the Spaniards in 1799, when Lieutenant-Governor De Lassus acted for Upper Louisiana, for Sainte Genevieve was 945 persons, and at the change of the government, in 1804, it was 1,300, one-third being slaves. The commerce of Sainte Genevieve in early times consisted principally in lead and peltries, and they had a large commerce on the Mississippi and Ohio Rivers by keel-boat transportation. The commercial men of Sainte Genevieve during the Territorial government, from 1804 to 1820, were remarkably active and successful in their business pursuits. At that time many merchants of Saint Louis had to make their purchases at Sainte Genevieve. Mr. Ferdinand Rozier, sr., a prominent merchant in those days, traveled from Sainte Genevieve to the city of Philadelphia six times on horseback to transact business Such trips at present would be looked upon as singular and romantic. Mr. Louis Bolduc, an old merchant, became by commerce very rich. Mr. Thomas Maddin, an American, also of wealth, offered to wager with Bolduc as to which had the most wealth. Bolduc soon silenced him by requesting him to bring his half-bushel to measure his silver money, which he kept at the time in his cellar.

The wealthy and enterprising house of Menard & Vallé was established in 1817, the memorable year that steam-power was introduced in Upper Louisiana (when the *General Pike*, commanded by Capt. Jacob Reed, who entered and fastened his boat August 1, 1817, at the port of Sainte Genevieve). This commercial firm had a large trade with the Indian tribes. Pierre Ménard, of Kaskaskia, one of the partners, was then Indian agent, and controlled a large business throughout the West. Sainte Genevieve, from its first settlement, was an important commercial point, for it was the depot of all the lead, copper, nickel, cobalt, and iron from the Iron Mountain, Pilot Knob, Mine Lamotte, Vallé Mines, and Potosi, up to the year 1857, when the Iron Mountain Railroad was built, that deprived Sainte Genevieve of this trade, which was afterward carried to Saint Louis.

CAIRO.

In many respects this is the most remarkable water center on the earth. All the land drained by the Missouri and Mississippi Rivers flow to this point, and from Wisconsin, New York, West Virginia, North Carolina, from the borders of South Carolina, from Georgia, Alabama, Tennessee, Kentucky, Mississippi, Ohio, Indiana, Missouri, and Illinois, there are contributions that swell the waters that wash the shores at Cairo, Ill.

Raw material, whether stone, timber, coal, or mineral, can be floated to this point, and the manufactured article can be floated away; navigation is never closed below the town, and the harbor is the finest on any stream in the United States. Cheap transportation lies here inviting capital and manufactures, and a curious feature of the situation is that no board of trade exists and no record is or has been made of the large business done by river and rail, so that comparatively little can be definitely told of local traffic, and that little only by infinite pains and research.

Pittsburgh floats iron ore from Iron Mountain, in Missouri, past Cairo, a thousand miles farther on, to use in her furnaces, where coal and ore and their product could all find convenient shipment to Cairo and thence to any point of the compass.

Before railroad days the tobacco and cotton trade from the Cumberland and Tennessee Rivers constituted a large share of business at this point; latterly that has all gone to the railroads, and railroads have taken also largely of the river traffic, that can now go direct and that formerly went round by water.

So favorably is Cairo situated for the purposes of manufacture that the Studebaker Wagon Manufacturing Company secures the timber here and ships it to their factory at South Bend, Ind., and the Singer Sewing Machine Company have established here a factory that turns out about 2,500 cases per day. Oak and hickory are the desirable timbers that are found convenient and abundant in this region.

The confluence of the rivers and the crossings of the numerous railroads naturally result in an extensive interchange and transfer of traffic, there being 4 regular transfer-boats for cars and 3 barges for tugs. There are 7 railway inclines to the water's edge, 2 on the Kentucky shore, 2 in Missouri, and 3 in Illinois, and the grand aggregate of cars handled in 1886 was 379,138; for six first months in 1887, 259,232.

BRIDGE AT CAIRO.

The growth of business has been such as to warrant the building of a bridge at this point over the Ohio River, by the Illinois Central Railway, and the work is being pressed with a view of finishing the work in 1890, or sooner if possible. The estimated cost is about $3,000,000, the bridge to be almost wholly made of steel. Including approaches the entire length will be about 3⅓ miles. The superstructure is to stand 53 feet above high-water and 105 in the clear above low-water mark. Experimental borings showed that rock bottom could not be found at a depth of 200 feet, so it has been determined to build the bridge upon caissons sunk by the plenum-pneumatic process to a depth of 75 feet below low water, and it will rest on a sand foundation. The caissons carrying the 518½-foot spans will be 30 by 70 by 50 feet high; those carrying the 400-foot spans will be 26 by 60 by 50 feet high.

Commencing at the Illinois end, at the upper end of town, about one mile and a half above the Illinois Central depot, and extending across the Ohio to the Kentucky shore, the distances—center of piers—will be as follows, exclusive of approaches: To first pier, 254 feet; second, 257 feet; third, 523½ feet; fourth, 523½ feet; fifth, 406½ feet; sixth, 405 feet; seventh, 405 feet; eighth, 405 feet; ninth, 405 feet; tenth, 405 feet; eleventh, 404 feet; twelfth, 257 feet—a total of 4,650½ feet.

The approaches are to be built on timber trestle, which will afterward be filled; the aggregate length of approaches will be about two miles and a half.

The structure is designed to sustain but one track and transfers, limited to railroad business, no wagon-way being contemplated.

The geographical importance of the site on which Cairo is built—at the confluence of two great rivers, the Mississippi and the Ohio—was understood and appreciated by the earliest pioneers who visited the locality. The first attempt at a settlement was made in 1818, when one William Bird acquired the title to 360 acres situated at the extreme point of the peninsula formed by the two rivers. A more pretentious attempt at settlement was made a few years later by a company calling itself the City and Bank Company of Cairo, who entered 1,800 acres of land adjoining Bird's and laid out a town on paper, but the scheme collapsed with the death of the moving spirit amongst the settlers, who even forfeited their claim to the 1,800 acres entered.

The actual foundation of Cairo may be dated from the year 1838, when the Cairo City and Land Company was formed. The objects of the company were to acquire the title to all the land, to construct dikes and canals, lay out a town, and sell lots. To secure funds for carrying on the works the property was placed by a deed of trust in the hands of the New York Insurance and Trust Company and bonds issued to the extent of $287,000 for negotiation.

In 1846 the company, by a quit-claim and trust deed, placed all the property in the hands of Thomas S. Taylor, of Philadelphia, and Charles Davis, of New York, as trustees for the Cairo City and Canal Company, the New York Life Insurance and Trust Company, and the bondholders. The beneficial interest in the property was divided into 35,000 shares and these allotted in certain proportions to the various interests represented, 5,000 shares being retained by the trustees for sale to raise funds to carry on improvements.

ITS RAILWAY SYSTEM.

The Mobile and Ohio, the great north and south trunk line, gives easy access to Saint Louis, and to the Gulf at the port of Mobile, and is one of the best and most popular railroads in the West. The Saint Louis division of this road was originally a Cairo enterprise and the people have for it a kindly feeling, which on its part it fully merits and appreciates.

The Illinois Central, another trunk line, reaching from Sioux City, Iowa, to New Orleans, is another great north and south outlet to the principal markets of the country, North, Northwest, and the great South and Gulf ports.

The "Cotton Belt" connects it with Arkansas, Texas, and the great Southwest, and is a valuable outlet in that direction.

The Saint Louis, Iron Mountain and Southern forms a competing line into the Southwest and gives another Gulf outlet to the port of Galveston as well as another Saint Louis line.

The Cairo, Vincennes and Chicago line forms a northern and northeastern outlet.

Add to this the Mississippi, Ohio, Tennessee, and Cumberland Rivers, all great navigable streams, converging at this point, and in many instances paralleling the railroads above mentioned, and it may be a pertinent question to ask, where is there another city so advantageously situated as this so far as transportation is concerned?

An indisputable fact becomes conspicuous in the figures and statistics of Cairo, and that is that no city in the Union does so much business in proportion to the population.

In 1881 the number of craft touching at Cairo (including Ohio River) was 3,583, with a tonnage of 1,469,151 tons; in 1885 the number was 1,583, with a tonnage of 970,702 tons (including Ohio River).

In 1885 1,583 Ohio boats of 482,000 tons landed at Cairo, and 79 boats passed without landing, showing a tremendous decrease in those years. The railroad tonnage increased from 1,134,507 tons in 1881 to 1,346,151 tons in 1885.

In 1884 the Illinois Central Railroad transferred by boat at Cairo 67,723 loaded freight cars and 8,000 passenger cars, and in 1885 the transfer amounted to 73,392 freight cars and 10,729 passenger cars.

NEW MADRID, MO.

Population of town, 1,200; of county, 8,000. Transportation all by river; freight, 12½ cents per hundred the year round. Chief town of the richest farm land in the United States. Supplies received from Saint Louis, Cincinnati, Memphis, and Evansville, but nearly nine-tenths from Saint Louis, Mo. Steam-boats average seven a week each way.

GAYOSO, MO.

Population, 500; county, 5,000; 1 cotton-gin; 10 cotton-gins in the county and 5 saw-mills, in operation one to ten years; 3,000 bales ginned; worth $35 per bale in 1886; 1,000,000 feet of lumber cut in 1886, worth $6 per 1,000; all capital owned in the county; product sold in Saint Louis and Memphis; transported wholly by river; wages $1.25 per day; closed river precludes shipment; received from north only merchandise; shipped 100 tons of freight south; shipped 500 tons of freight north; freight rates $5 per 1,000 feet on lumber to Saint Louis and Cincinnati; 75 cents a bale on cotton, and 20 to 50 cents per 100 on merchandise; four stores do about $50,000 of business; receive mercantile supplies from Saint Louis, Cincinnati, Cairo, Louisville, Evansville and Memphis, all by river; steamers from Saint Louis, Vicksburg, and Cincinnati stop ten times per week.

COTTONWOOD LANDING, MO.

Population, 100; county inhabitants, 5,000; 2 cotton-gins; 1 saw-mill; 1 blacksmith and 1 wagon shop; 20 cotton-gins in the county; saw-mills and shingle factories first built in 1865; saw-mills did $12,000 business in 1886, and 5,000 bales of cotton were ginned; all local capital; product sold in Saint Louis, Cincinnati, and Memphis; all shipped by river; $1 per day for operatives; all raw material grown in the county; overflow stops manufacturing; little received from the South in 1886; supplies all from the North; about all the cotton and corn was sent south; lumber, cattle, and hogs shipped north; no railroad; freight, 12½ to 50 cents per 100 pounds to Saint Louis and Memphis; 6 business houses; 2 cotton-gins; 1 saw-mill; 2 hotels; 1 church; 1,070 bales cotton ginned and shipped; 250,000 feet lumber sawed and shipped; $6,000 worth of goods sold; 2,000 bushels corn shipped; 1,000 head cattle and hogs shipped; 6 new buildings erected; supplies from Chicago, New York, Saint Louis, and Cincinnati, Boston, and Memphis mostly by river; six mails a week by river; three transient boats besides.

CROWELL'S, OR GOLDEN LAKE, ARK.

Population, 500; county, 10,000 inhabitants; river only means of transportation; name originally Crowell's, changed "when old man Golden got drowned in the lake;" retail business aggregated $100,000 for 1886; receives supplies mostly from Memphis, Tenn.; distribution extends to Osceola, Ark., and Fulton, Tenn.

CARUTHERSVILLE, MO.

Population, 300; county, 6,000 inhabitants; river only means of transportation; 800 bales cotton shipped south in 1886; 300 bales shipped north; about $75,000 worth of business each year.

OSCEOLA, ARK.

Population, 600; county inhabitants, 10,000; 7 cotton-gins in town and 25 in the county, and make 12,000 bales; pay laborers $20 per month; river the only mode of transportation; 7,500 tons of freight received from the south in 1886, worth $150,000; 2,500 tons of freight received from the north in 1886, worth $50,000; 3,750 tons of freight shipped south in 1886, worth $220,000; 10,000 tons of freight shipped north in 1886, worth $40,000. River freight to Memphis, 20 cents per 100 pounds; to Saint Louis 30 cents per 100 pounds.

County seat of Mississippi County, situate 80 miles above Memphis, 320 miles from Saint Louis; was incorporated 1876; good court-house, 6 churches, 3 white and 3 colored schools, and the town is in the heart of one of the most fertile districts in the South. Total local trade about $200,000 per annum; ships 5,000 bales of cotton and 40,000 sacks of cotton seed, the first worth $200,000 and the latter $20,000; products shipped to Saint Louis, Memphis, Cairo, and Cincinnati; boat arrivals average one per day.

HICKMAN, KY.

Population, 2,000; of county, 10,000; fine manufacturing establishments, with saw-mills, 35; established since 1880; aggregate product for 1886, $500,000; invested capital, $200,000, all local; manufactures consist of lumber, boxes, wagons, and pumps; sold in Kansas, Illinois, Texas, and New Orleans, the latter market taking flour, only a small percentage consumed in the home State; 80 per cent. goes by rail to Kansas and Illinois; wagon factories, 60 employés; pumps, 75; box factories, 25; flour, 20; saw-mills, 400; annual wages, $250,000 to $300,000; materials secured in immediate neighborhood; river never closed at Hickman and below; nothing received from the South in 1886; from the North 10 to 20 tons per week; considerable corn sent South; about 60 tons per month received by rail, valued at $3,000; about 800 tons shipped per month by rail, worth $15,000, to Saint Louis, New York, New Orleans, Kansas City, and Leavenworth; river and rail rates usually the same; situate at terminus of Nashville and Northwest Railroad; the center of a large lumber trade; 18 saw-mills, large wagon factory, pump factory, box factory, 3 planing-mills, flour-mill; fine corn and wheat country; manufacturing and agricultural products increasing largely; receive supplies from Saint Louis, Cincinnati, Louisville, and New Orleans, mostly by river; products sent to Union City and Nashville (Tenn.), Cairo (Ill.), and Evansville (Ind.); river business dead compared with what it was years ago; railroads driven boats from the water; outside boats can not compete with the big lines of steamers.

ASHPORT, TENN.

Population of town, 300; county, 30,000; one manufacturing establishment in town; 200 in county; established from 1830 to 1887; all capital owned by residents; product sold in Memphis, Saint Louis, Kansas City, Chicago, and Cincinnati; nine-tenths go out of the State, one-third by river and two-thirds by rail; each establishment runs from 5 to 30 employés; raw material, wood and cotton; floating ice or frozen river affects navigation seriously or stops it; river transportation 10 per cent. cheaper; town was settled in 1828; in 1886 2,000 bales of cotton shipped, 5 houses built, 1 cotton-gin, 1 saw-mill; $84,000 in goods retailed and 5,000,000 logs shipped; mercantile supplies received from the North by river and rail; local distributions confined to surrounding country; 200 boats arrive yearly.

HALE'S POINT, TENN.

Population, 500; 2 saw-mills and several cotton-gins; one mill sawed 5,000,000 feet of lumber in 1886, worth $2.50 to the mill as profit; half the capital is resident; sells

to Saint Louis; shipped by tow-boats and barges; 25 operatives, with total wages of $5,000; close of navigation shuts off shipments; value of freight received from South, approximately, $15,350; from the North, $7,700; value of freight shipped South, $25,000; shipped North, $8,500. No railroad nearer than 25 miles. No difference in river rates to and from Memphis during cold and warm weather, but to Saint Louis cold weather adds 50 cents.

Many years ago, one Sparrel Hale cut a canal connecting Forked Deer and Obion Rivers 4 miles from Hale's Point, which turned all the water down the old channel, around Needham's Island past Hale's Point, and put keel-boats in north and south fork of Forked Deer River and Obion River, which resulted in a very large shipping business at Hale's Point, connecting with all the interior towns, even Jackson and Trenton, Tenn. Previous to the building of the Mobile and Ohio Railroad there were shipped as many as 21,000 hogsheads of tobacco and 12,000 bales of cotton via Hale's Point each year. Since 1880 the Chesapeake, Ohio and Southwestern cut the town off from Dyersburgh, and now only local trade is done, which, however, has increased 50 per cent. since the war. Building has increased 50 per cent., and retail sales 100 per cent. Supplies received from Saint Louis, Memphis, and Evansville, Ind.

SAINT LOUIS TO MEMPHIS.

During August the river reaches its low stage, and September is likely to find the volume insufficient for satisfactory traffic unless early fall rains should intervene to swell the stream. But the continued decline in the quantity of water does not always involve a proportionate approach to the bottom of the river, for the bottom, curiously enough, often recedes as the waters diminish. For instance, if the gauge at Saint Louis should show 10 feet strong, Kinney Point, a shoal place, lower down the river, would show about 5½ feet, but when the Saint Louis gauge would disclose only 7 feet, Kinney Point would not measure only 2½, or a proportionate decline, but would more likely measure 4 feet or 4½ feet. The reason is, that as the river lowers its channel narrows, and the confined and concentrated stream carries the yielding mud away, and this is accelerated by the boats that rub against and stir up the muddy bottom. Paradoxical as it may seem, it is yet often true that the less water there is within the banks the more there is in the channel. But the water becomes shallower gradually till large craft can not take a full cargo, and it is a common practice for the Anchor Line steamers, with every facility and capability for heavy traffic and comfortable, even elegant travel, to load lightly above Cairo. From Saint Louis to Cairo there is much more transportation capacity than can be utilized, all because of inadequate river depth. And actual experience absolutely demonstrates that the difficulty can be easily obviated. Horsetail Bar, for example, was formerly a dangerous point on the river and a place of special dread to the boatmen; since the Government work was done not even delay has occurred there, danger is not thought of, and the channel is uniform, which latter can be said of few points on the whole river. Plum Point is another similar instance; formerly no more than 4 feet 10 inches could be relied upon, but on the 1st of August, 1887, at low water, the lead showed 8 feet, and in lead measurement 6 inches may be allowed—a sounding would doubtless have shown 8 feet 6 inches.

The absence of such improvements as have made Plum Point, Horsetail Bar, and other points safe and reliably navigable, entail upon boatmen the most elaborate care and labor in noting, recording, and reporting the different and unceasing changes in the crossings, the channel, obstructions, and the like. To a landsman these changes are incredible—to the boatmen daily and dangerous realities. Every pilot makes a diary of his experience and observation, and leaves his record at the next port for the benefit of the next to go over that course, whether up or down stream, and sometimes so marked and unsafe is the alteration or obstruction that a telegram is sent to the following boat.

The river now is full of snags, and as the water lowers more and more of them appear upon the surface. At the mouth of the Okaw River there is a stretch of about 3 miles of dangerous water, but it seems the Government snag-boats are unable to take advantage of the favorable season and water stage for want of appropriation. But snags, dangerous and abundant as they are, do not constitute the only obstruction. Sunken boats are a constant menace to life and property, and this danger could be easily obviated by the placing of barrel-buoys, but even this the idle Government's fleets can not accomplish for want of appropriation, while the Treasury is overrunning with surplus.

The famous New Madrid reach is peculiar, and thus far has received no benefit from the Government, though the unevenness of the bottom would seem to warrant attention. The earthquake that resulted in the "sunken land" and in Redfoot Lake, left the bed of the river also shaken up and deranged. The pilots have named that stretch of the river the "corn rows," because the lead will show first 12½ feet, then 23 feet, then 9 feet, then deep four or no bottom, and the bed does not seem to yield to the wear

and wash of the river as at other points. When the water recedes the bed does not recede with it, as noted above at Kinney point and other places.

The Government lights have proven to be of very great benefit, saving time and affording fixed and reliable marks by which pilots run without hesitancy where in former times it was necessary to lay by till next day or go ashore, build fires, and look for marks not discoverable at night. Steam-boat men only wish there were more of these lights.

But the landings are often made ludicrously inadequate and uncertain. There is no wharf-boat between Saint Louis and Cairo, nor between Cairo and Memphis, and yet boats put ashore considerable freight at different intervening points that supply large tracts of country back of the river. This is notably true of New Madrid. The landing is the boat stage, which is often run up the bank—anywhere—at an angle of 25 to 45 degrees, affording exhibitions of agility and feats of strength on the part of the roustabout, or black derrick, that would do credit to the professional acrobat.

These exigencies of the river trade have brought about an admirable disposition to oblige on the part of boatmen, so that their spirit of accommodation and kindliness has become proverbial, and officers are selected and retained who can best secure and keep the respect and confidence of patrons, and river traffic and travel have thus become the most enjoyable of all business and social intercourse in the West.

Nothing is left undone that will insure safety and expedition in business or comfort and pleasure in travel. Soundings are always taken at doubtful points; on the down trip the *Arkansas City* spent about an hour taking soundings at Twin Hollows, and though drawing but 5½ feet she rubbed bottom twice, once at Twin Hollows, where measurement showed 6 feet scant, and at Kinney Point, where the lead disclosed 5½ feet—this was about the first of August. On the 7th the *City of Providence* was delayed going up stream by running into 3-foot water just below Kennett's.

At Memphis there is always deep water and a good harbor, and a bridge is contemplated, but up to date the bridge enterprise has not taken definite shape.

MEMPHIS.

The steady advancement of this city for the past five years towards a higher social and commercial prosperity has often been the theme of writers, and throughout the country various publishers have anon been vigorous in their praise of Memphis and the enterprise of her people. There are few cities in the South, or even anywhere on the continent, that can show such evidences of material growth and general well-doing as can be seen even at the dullest of times in and around Memphis. The myriads of people who are breaking up from the old, worn-out plantations of the Southern interior are now turning their steps towards the fertile lands to be found in this section of the Mississippi Valley.

The river trade of Memphis, notwithstanding the encroachment of the numerous railroads, still forms an important factor in the commercial and business interests of this growing city. Years ago there was opposition in all the various trades, but now each is separate and distinct, with no conflicts or cutting of rates, all reaping a fair profit on stock invested. The season of 1886 began as follows:

The Lee Line comprised thes teamers *James Lee*, tri-weekly, to Friar's Point, and the *Coahoma*, tri-weekly, to Ashport, with the *Dean Adams* held in reserve; but the latter was burned at the landing on the night of May 23, together with her cargo, which she had brought that day from Osceola. This line now has the stern-wheel steamer *Gayoso* as a reserve boat.

The Memphis and Vicksburg Packet Line was composed of the steamers *Will S. Hays* and the *Kate Adams*. The former, during the early part of the year, made weekly trips to Vicksburg, and the *Kate Adams* made semi-weekly trips to Arkansas City.

The boats of the Arkansas River Packet Company Line comprised the steamers *E. W. Cole*, *Joe Peters*, and *R. L. Cobb*, one of which is kept as a reserve boat. During the business season two boats ran, making a semi-weekly line, but during the dull months one boat was found sufficient to do the business.

The Memphis and White River trade was represented by the steamers *Chickasaw*, *Alberta No. 3*, *De Smet*, and *Freddie Robinson*. There was direct opposition until the fall of the year, when Capt. Milt Harry, who ran the *De Smet* and *Robinson*, withdrew from the trade. Rates were restored and during the balance of the season Captain Postal ran the steamers *Chickasaw* and *A berta No. 3*.

The Memphis and Saint Francis River Line trade is under the management of the Lee Line, and ran the side-wheel steamer *Rene Macready* and the light-draught steamer *Ed. Foster*, making during the business season semi-weekly trips, and during the dull season one trip a week.

The season for the Memphis and Tiptonville trade opened with the *Gayoso* as a semi-weekly packet, but in the fall the steamer *Chesapeake*, a fine and fast side-wheel boat, was purchased and took the place of the *Gayoso*.

The Memphis and Cat Island short trade was represented by the steamer *Enquirer*, but she withdrew from the trade soon after the fall business set in.

The Memphis and New Orleans Line comprised the steamers *C. P. Chouteau* and *Helena*, each of which can carry the weight of 10,000 bales of cotton. They run only during the busy cotton season, then go to Saint Louis to spend the summer in the excursion business.

The Memphis and Cincinnati Packet Company during the past season comprised the steamers *De Soto*, *Ohio*, *Buckeye State*, and *Granite State*, which form a semi-weekly line between the two cities and receive a good patronage.

Transient lines include all steamers hailing from above and below this city doing regular business here, and include the famous Saint Louis and New Orleans Anchor Line, one or two of which passes here every day.

The Southern Transportation Line sends out two boats a week from Cincinnati, but they do very little here.

The Mississippi Valley Barge Line has a tow passing here every few days at irregular periods.

The ferries include the *General Pierson*, transfer steamer for the Memphis and Little Rock Railroad; the *Charles Merriam*, transfer steamer for the Kansas City, Springfield and Memphis Railroad; the *P. H. Kelly*, running between this city and West Memphis; the *Alice*, running between this city and Mound City, 5 miles up the river. During very high water the *Alice* goes to Marion, Ark., 5 miles back of Mound City.

RIVER TRANSPORTATION STATISTICS.

The river trade has its fiscal year, or business season, beginning on September 1 of each year, and ending August 31 each following year.

The reports of the Cotton Exchange furnish the following receipts of cotton by river:

By steamer—	Bales.	By steamer—	Bales.
Kate Adams	25,508	*Dean Adams*	2,795
James Lee	24,306	*Will S. Hays*	2,453

IMPROVEMENT OF THE MISSISSIPPI RIVER.

The propriety, or rather the necessity—if the matter be looked at from the standpoint of political and commercial justice—of giving national attention and aid to the improvement of the Mississippi has been urged for years by the people of the great valley drained by the Father of Waters. Numerous conventions have been held, as indicated in other pages of this report, and memorials have been presented to Congress setting forth the abundant and impressive facts as to area of country interested, difficulties to be surmounted, and the traffic to be handled.

The best minds in business, in education, in the professions, and in politics have given attention to questions of bettering Mississippi transportation, and the records are full of interesting data, the merest glimpse at which can be given in this report. In 1866 a convention was called which met in Saint Louis on the 12th of February, 1867, and the information elicited and presented in the memorial to Congress was rich in statistics and clear and strong in statement. Among other things it was shown that the modes of transportation ranked as follows: Ocean cost $1\frac{1}{2}$; lake 2; river $2\frac{3}{4}$; canal 5, and railroad $12\frac{1}{2}$ to $13\frac{2}{3}$ or 65 mills per ton per mile of average freight; that by delays from river obstructions the commerce of the Mississippi was burdened by an expense of nearly $66,000,000; that there was a saving of 30 cents a bushel on grain via New Orleans; that the river trade (Ohio included) even then amounted to nearly 8,000,000 tons, and that all this almost inconceivable interest was subject to delays and costly inconveniences entirely within the power of engineering skill to obviate.

The findings of the investigators were aided and indorsed by such able men as James B. Eads, E. O. Stanard, Professor Waterhouse, G. B. Allen, Theodore Cook, Joseph Brown, and others of like ability and distinction.

But there have been several conventions in the interest of Mississippi River improvement, the first of notable consequence being held in Memphis, Tenn., forty-two years ago, and presided over by the eminent South Carolinian, John C. Calhoun.

In 1847 a convention was held in Chicago with the same ends in view, in the proceedings of which such men as Lincoln, Corwin, Schenck, Greeley, David Dudley Field, and Thomas Butler King participated, and Henry Clay and Silas Wright sent favorable letters. Four years later a similar convention was held in Burlington, Iowa. In 1866 Dubuque held such a convention. In 1867 Saint Louis called another; in the same year Keokuk held another. New Orleans in 1869, 1875, 1876, 1879, and 1880, and Saint Louis had conferences in 1872 and 1873. Vicksburg held a river convention in 1875; Saint Paul in 1877; Quincy in 1879, and Davenport in 1881, and other smaller meetings were held at various points having the good of the river or some portion of it as the object, so that it is clearly demonstrated that contiguous country and interested localities are, and for many years have been, in the most profound earnest on the subject, and an interesting and exhaustive literature has grown out of the papers and debates.

As an instance of the improvement in river navigation, it is cited that in 1819 the first steam-boat came from New Orleans to Saint Louis, carrying 130 tons, consuming twenty-seven days; now steamers of 2,000 tons make the distance in six and seven days. Ocean steam-ship travel shows not even approximate improvement with all its progress, which demonstrates the benefit of attention to and betterment of the river channel.

The convention held in Saint Louis in 1881 elicited a great deal of valuable information, much of which was new and some confirmatory of statements and theories of the river commission.

The facts seem to be that the lands subject to overflow from Saint Francis Basin to Memphis are as follows:

Basin.	State.	Square miles.	Acres.
Saint Francis Basin and Front	Illinois	65	41,600
	Missouri	2,874	1,839,360
	Kentucky	125	80,000
	Tennessee	426	272,640
	Arkansas	3,216	2,058,240
	Total	6,706	4,291,840

This is subject to the qualification that the area computed above extends some 70 miles (river way) below the city of Memphis.

The Saint Louis convention, after discussing the matter of overflow, adopted the following resolution:

"*Resolved*, That the importance of the subject of reclaiming and protecting from overflow, by the annual floods of the Mississippi River, of the great region within its delta, can not be overestimated. The Mississippi River is the natural drain of a vast area of our territory between the Rocky and Alleghany Mountains, and from our northerly boundary to the Gulf of Mexico, and embracing over 1,200,000 square miles. It embraces portions of the States of Missouri, Illinois, Arkansas, Tennessee, Mississippi, and Louisiana, and contains about 38,700 square miles, or, in acres, in the aggregate, 24,768,000; of this amount there are 4,000 miles of sea-marsh, and irreclaimable, leaving 22,208,000 acres of fertile land, wholly idle and useless, on account of its annually being inundated by the waters of the Mississippi.

"The soil is rich alluvial deposit and inexhaustible. Plantations so situated as to be free from the invasion of the floods, without fertilizers, produce crops of sugar, cotton, rice, and corn as when first redeemed from the forest. The land subject to overflow, if protected by levees and reclaimed, is capable of sustaining not less than 20,000,000 people. Its productions would be the richest in the world, averaging two bales of cotton to the acre; 2,000 pounds of sugar, besides molasses, etc., to the acre, and 40 bushels of corn; and other cereals, as well as vegetables aud fruits, grow in profusion. In fact, the wealth of the overflowed lands of the Mississippi Valley are exhaustless and inexhaustible, and yet this favored region is decaying, becoming a waste and a wilderness, because of the annual floods of the river which divides its center.

"The work to reclaim this vast region should be the solemn and immediate duty of the General Government, and to restore it to the hands of the husbandman."

It was further resolved (page 87) that no State alone can build its levees, because of the independence of its topography. A system to be efficient in one must comprehend them all. The interior is a basin or series of basins, the water, whenever let in, submerges the basins alike.

After days of discussion and deliberation by the most able and conscientious men of the Mississippi Valley, or of the whole country, the following, among other, resolutions were adopted:

"*Resolved*, That this convention recognizes with extreme satisfaction and emphatic approval in the passage of the act of Congress of June 28, 1879, "for the appointment of a Mississippi River Commission," and in the comprehensive and scientific surveys and important recommendations made by distinguished engineers appointed on that Commission, as set forth in their reports of February 17, 1880, and January 8, 1881, the first well considered and effectual step toward the complete and permanent opening of the Mississippi Valley to the markets of the world; but would also strongly express its regret at the refusal of the last Congress, after creating said Commission and notwithstanding the deliberate and emphatic approval of their plans by the House Committee on Improvement of the Mississippi, to appropriate the amount estimated and recommended by said Commission for doing the work by them carefully laid out and proposed; and be it further

"*Resolved*, That in the deliberate and earnest judgment of this convention, delegated to represent the interests in that behalf of more than one-half the States and Territories of the Union, inhabitated by more than one-half of its entire population, from whom is collected above 70 per cent. of the internal revenue of the nation, whose internal commerce is already one-half that of the whole United States, more than twelve times greater than the total foreign commerce of the nation, and larger than the total foreign commerce of the world—but upon whose industry is this year levied, by the obstacle to the safe and easy navigation of the Mississippi River and its navigable tributaries, a needless direct tax, by way of increased freights and insurance, demurrage, wrecks, and repairs of not less than $10,000,000. It is the imperative duty of Congress and the right of the people, for whom this convention is authorized to speak, that the legislation thus wisely begun, be made effectual and permanent by enlarging the powers of the River Commission to include the active prosecution of the works already recommended by them, and by the regular and separate appropriations, from year to year, of such sums as said Commission, acting under the reasonable supervision of Congress, shall report as necessary to that end; so that this great and indispensable work, national in every sense, shall no longer be delayed; and be it further

"*Resolved*, That the scientific and comprehensive system of river improvement, by a competent commission, thus inaugurated, should be applied to the complete and permanent improvement and maintenance of all the navigable tributaries of the great river; and be it further

"*Resolved*, That this convention recognizes, with great satisfaction, the benefits already resulting to the navigation of the Mississippi River and its principal tributaries by the extension of the light-house system thereto; and expresses the earnest hope that the partial lighting of those rivers may be speedily enlarged, by increasing the number of districts and lights to such an extent as the Light-House Board, in consultation with the River Commission, shall find necessary to render such service completely efficient."

The resolutions contain the best judgment of very able and eminent men who would not stand good for a wrong statement; but they were at the same time interested parties, and it is neither unfair nor unsafe to allow something for their interest and for the uncritical habit of such bodies in accepting resolutions tending to promote their common aim without close and careful discrimination. The amount of land involved is doubtless approximately correct, as will appear by reference to the tables and measurements of the Government engineers. But the number of people given which such reclaimed lands could sustain (20,000,000) is open to question. The reclaimed land would be richer than the average soil, of course, and an entirely safe computation, 5 acres to the man, would make an aggregate of about 5,000,000 people, or more than enough for two additional States to the Union.

At the convention held for the improvement of the Mississippi in Washington in February, 1884, ex-governor E. O. Stanard, of Saint Louis, cited the report of the Senate committee, consisting of the five Senators, Logan, Sawyer, Jonas, Jones, and Walker, in support of the good already accomplished by the doings of the River Commission, and at the same convention the following resolutions were unanimously adopted:

"*Resolved*, (1) That the interests for which this convention is authorized to speak are entitled in the highest degree to consideration from the National Legislature, to which is intrusted by the Constitution as well the regulation of commerce between the States as the promotion of the general welfare. The domestic commerce affected is already one-half that of the whole United States—more than twelve times greater than the total foreign commerce of the nation and larger than the total foreign commerce of the world. Upon this vast commerce has been levied, year by year, a direct and wasteful tax, enormous in amount, by way of increased freight, insurance, demurrage, wrecks, and repairs, caused by sand-bars, snags, treacherous banks, and other obstacles to the safe and easy navigation of the Mississippi River and its navigable tributaries. No exercise of the power of Congress can be more legitimate or more just than the relief of that commerce, and of the immense and varied industries which support it, from such need-

less burdens, by removing those obstacles to navigation. To have acquired these great water ways and the vast territory which they drain was the triumph of early American statesmanship. To restrain their mighty floods and direct their resistless energies is the achievement of its latest science. It is for the statesmanship of to-day to complete that triumph by calling that science permanently to its aid.

"(2.) That we earnestly reaffirm the declaration of the river improvement convention which met in Saint Louis in October, 1881, that it is the manifest and imperative duty of the Government of the United States to cause to be made such improvement of the Mississippi River and its navigable tributaries as shall permanently secure the safe and easy navigation thereof. Especially is this duty obvious and our demand justified in view of the donations already made by Congress in land, amounting to nearly 200,000,000 acres, and in bonds issued or guarantied nearly $100,000,000 more in aid of artificial highways, the property of individuals, and which even at lowest rates must furnish the most costly form of transportation on a large scale, as compared with appropriations not yet one-tenth so great in all, for the improvement of more than 15,000 miles of natural water ways, whose freedom from tax or monopoly is protected by constitutional guaranties, while in cheaper service and unrestricted competition they afford the most efficient check upon exorbitant charges by any other route to the sea.

"(3.) That we also emphatically approve the creation by Congress of the Mississippi River Commission, as the first well-considered and effectual step towards completely and permanently opening the Mississippi Valley to the markets of the world. The work of that Commission has passed out of the region of experiment, and has fully justified the expenditure made and plans adopted for the improvement of the lower river. We especially approve their plans for preserving to the main river all the water of all its tributaries, and for removing all obstructions, whether natural or artificial, which may tend to deflect or draw off any portion of the same. We also declare that the system now being successfully prosecuted under the direction of the Secretary of War for the improvement of the Upper Mississippi meets with general approval. In the judgment of this convention the said improvements ought to be continued under the same system, general plans, and jurisdiction, respectively, as at present. We also earnestly urge upon Congress that the scientific and comprehensive system of river improvement, by a competent commission, thus inaugurated as to the Mississippi, should be applied without delay to the complete and permanent improvement of the Mississippi, the Ohio, and other navigable rivers. And a true economy dictates that all such work should be carried on by liberal and regular appropriations.

"(4) That in the interest of cheap transportation and to afford a choice of water routes to the seaboard, we regard connections between the navigable waters of the Upper Mississippi and the great lakes as of great importance, and that Congress, in making appropriations, ought to have regard to the establishment of free water communication between the valley of the great river of the West and tide water of the East, in accordance with the recommendation heretofore made by the President of the United States in his special message on this subject.

"(5) That we desire to express our cordial appreciation and acknowledgment of the broad and patriotic views expressed and the important services rendered to the improvement of the water ways of the West by the President of the United States in his official acts and declarations, from the time of his accession to that high office.

"(6) We also recognize the wisdom of Congress in the appropriations heretofore made for the improvement of the rivers of the West, at the same time observing with satisfaction the recent recommendation of the Senate Select Committee on the Mississippi River Improvement that 'if the work of improvement be worth doing it is worth doing well, and that to secure thoroughness, permanency, and economy in its prosecution a uniform system should be adopted and adhered to.'

"(7) That we also recognize with great satisfaction the benefits which have resulted to the navigation of the Mississippi River and its principal tributaries from the extension of the light-house system thereto, and renew the hope that the number of districts and lights therein may be increased to such extent as the Light-House Board, in consultation with the River Commission, shall find necessary to render such service completely efficient.

"(8) That we approve the action of the executive committee on the improvement of the Western water ways, and request that it continue its labors in the direction and for the purposes for which it has been formed, until the Mississippi River and its navigable tributaries are in such condition as the safety of the people and the interests of commerce demand and deserve. And said committee are authorized and requested to take proper steps for presenting to Congress a suitable memorial in the sense of the foregoing resolutions, and for publishing and distributing the proceedings of this convention."

OF TRANSPORTATION GENERALLY.

A committee appointed by the Merchants' Exchange reported as follows:

To the President and Board of Directors of the Merchants' Exchange of Saint Louis:

In submitting our report for the year ending December 31, 1886, we beg to call your attention to a few facts in connection with the work of the committee.

In our last annual report we advised you of having secured the consent of a majority of the trunk lines to make the rates from the seaboard to East Saint Louis 116 per cent. of the Chicago rate instead of 119 per cent., which it had been theretofore. The promised change went into effect March 10, 1886, and has since prevailed, and will continue. The beneficial effects of the reduction have been very sensibly felt by the manufacturing and jobbing interests of the city.

Upon the organization of the committee, the jobbers assured us that if this result could be obtained, not only would the existence of the committee be justified, but the wisdom of its continuance clearly demonstrated. The change means a saving of 3 cents on every dollar paid for freight shipped from any point east of the Allegheny Mountains to East Saint Louis, and is an annual saving to the very large houses of from $4,000 to $7,500 per annum. In the aggregate it is estimated to be a saving of at least $500,000 per annum to the city's commerce. This discrimination against Saint Louis had existed since 1871, and, although palpably unjust, several previous attempts to remove it had proved unavailing.

Our last annual report also informed you of the beginning of an effort to correct the great discrimination existing against Saint Louis in "Southwestern" rates. As we anticipated, that fight has proved to be an herculean task. Nothing daunted, however, we have constantly had the object in view, and have pursued it with unwavering fidelity and untiring energy. We consider it the most important freight struggle ever undertaken for the commercial interests of Saint Louis, and trust our successors will continue in the same line which we began. The overcharges between Saint Louis and Kansas City, as compared with rates between Chicago and Kansas City, amount to 23 cents per 100 pounds on first class; 16 cents on second; 14 cents on third; 12 cents on fourth; 9½ cents on fifth; 7 cents on meat, wheat, and flour; 4½ cents on corn, oats, and hay; 73 cents per ton on hard lumber west-bound, and $1.11 on same east-bound; 60 cents on soft lumber; 82 cents on ore, bullion, etc.; $15 per car on horses and mules; $13.50 on cattle; $3 on hogs; $4 on sheep, and other articles in proportion. We are striving to secure the same rate per ton per mile between Saint Louis and the Missouri River as at the same time prevail between Chicago and the Missouri River points. In other words, we are trying to have the Southwestern Association adopt the same basis for rates between its Missouri River points and Chicago and Saint Louis as that governing between New York and Chicago and East Saint Louis. Rates to and from Missouri River points, viz, Kansas City, Leavenworth, Atchison, Saint Joseph, Council Bluffs, and Omaha, with few exceptions, base the rates between Saint Louis and points beyond the Missouri River as far west as California, as far north as the Northern Pacific, and as far south as the Southern Pacific.

List of accidents on Western waters during the years 1886 *and* 1887.

Date.		Name of vessel.	Remarks.
1886.			
Jan.	1	Steamer *H. T. Dexter*	Snagged and sunk 25 miles below Evansville.
	4	Steamer *H. D. Chipley*	Sunk in Chattahoochie River.
	18	Tug *Modoc*	Exploded her boilers at Pittsburgh, killing one and wounding two of the crew; tug valued at $4,000.
	20	Steamer *Keokuk*	Lost a barge in Red River, below New Poland.
	21	Tow-boat *Ark*	Was sunk near Wheeling.
	30	Steamer *John B. Maude*	Was totally destroyed by fire at New Orleans; was valued at $30,000; insured for $10,000.
Feb.	11	Tow-boat *Nellie Speer*	Lost three of her coal flats at Rising Sun.
	12		The ice at Saint Louis struck the Mississippi Valley wharf-boat and sunk it.
	12	Steamer *Athlete*	Caught fire and burned to the water's edge near Jacksonville; was valued at $20,000; insured for $10,000.
	15	Tow-boat *Lulu Worth*	Sunk and total loss, caused by ice moving at Saint Louis.
	15	Transfer-boat *Pacific No. 2*	Do.
	15	Wrecking-boat *T. F. Eckert*	Damaged by ice moving at Saint Louis.
	15	Steamer *Nellie Peck*	Do.
	15	Steamer *General Rucker*	Do.
	15	Steamer *J. C. McMullin*	Do.
	15	Steamer *Andrew Christy*	Do.

List of accidents on Western waters during the years 1886 *and* 1887—Continued.

Date.	Name of vessel.	Remarks.
1886.		
Feb. 15	One barge	Loaded with ore damaged by ice at Saint Louis.
16	Government steamer *A. A. Humphreys.*	Sunk by ice moving at Bushberg, 25 miles below Saint Louis; damaged the river commission fleet and workings to the amount of $300,000.
17	Tow-boat *Lioness No.* 2	Struck her tow of barges against bridge at Beaver, losing two of them.
20	Tow-boat *John F. Walton*	Ran her tow against pier of the Cincinnati bridge and sank three barges, containing 32,000 bushels of coal.
23	Steamer *Jennie May*	Struck a snag and sunk, below Fort Smith. Her cargo, which was above decks, was carried away. No insurance on boat or cargo.
Mar. 10	Steamer *George Strecker*	Burned at Beverly, Ohio; boat valued at $6,000; insured for $4,000.
10	Steamers *Sciota* and *Bostona*	Collided at Middleport; slight damages to both.
24	Steamer *Josh Cook*	Sunk a boat of coal and one fuel barge at Steubenville, by striking bridge.
24	Tow-boat *John Moran*	Ran into coal fleet of Brown's Sons at landing, Steubenville, and sank six of Brown's barges.
31	Tow-boat *Iron Age*	Sunk a coal boat going over the falls at Louisville.
April 1	Tug *John P. Keiser*	With barge in tow, struck middle pier of Saint Louis bridge and sunk; was total loss; valued at $10,000; no insurance. The barge was saved.
4	Tow-boat *Oakland*	Sank two of her barges loaded with ice below Sainte Genevieve; loss $5,000; insured.
6	Steamer *Mountain Boy*	Was capsized in gale opposite Owensborough; was a total loss; value, $5,000.
7	Propeller *Alf Stevens*	Struck a stump and broke in two in Cumberland River; insured for $2,000.
10	Steamer *Henry A. Tyler*	Struck the railroad bridge above Paducah, and tore away 75 feet of her upper and lower starboard guards and sligh ly damaged her cargo.
13	Steamer *Undine*	Sunk in upper Missouri; valued at $800.
14	Steamer *Dyersburg*	Sunk in upper St. Francis River.
14	Tow-boat *Deadman*	Sunk two of her coal barges at Pittsburgh.
14	A tow belonging to tow of *The Diamond.*	Sunk at Pittsburgh.
16	Steamer *De Smet*	Struck the bridge below Newport and was damaged to the extent of $1,500.
17	Steamer *Silver Thorn*	Caught fire above Vicksburg and was destroyed; was insured for $5,000.
18	Steamer *Hibernia*	Ran aground and went to pieces in Kentucky River, near Madison.
May 4	Tow-boat *John Penny*	Picked up a snag near Pittsburgh, but with aid of her pumps came through all right.
9	Twenty-seven coal barges	Broke loose from their moorings at Pittsburgh and sunk; damages, $30,000.
17	Steamer *Lizzie Cassell*	Sunk 10 miles below Zanesville; was raised.
18	Steamer *Buckeye State*	Sunk at Hickman; was raised.
19	A barge	Loaded with 4,000 sacks of cotton-seed sunk in Yazoo River.
23	Steamer *De Smet*	Caught fire and was totally destroyed at Newport; was insured for $5,000.
24	Steamer *Dean Adams*	Caught fire and was totally destroyed at Memphis; valued at $35,000.
28	Tow-boat *Lioness*	Lost four of her coal boats above Vicksburg; damage, $4,000.
30	Steamer *Hine*	Sunk at Paducah.
June 19	Tow-boats *Sam Clarke* and *Fred Wilson.*	Collided at Pittsburgh, the former losing one barge.
July 18	Raft-boat *Bella Mac*	Caught fire and burned to the water's edge at La Crosse; total loss; valued $9,000.
29	Steamer *New Iberia*	Caught fire and was totally destroyed at Algiers.
Aug. 21	Tow-boat *Ella*	Sunk two barges of coal in Muskingum River.
24	Tow-boat *Ella Long*	Sunk two boats of coal at Point Pleasant.
24	*J. D. Lewis*	Sunk four boats of coal at Point Pleasant.
26	Tow-boat *S. P. Coe*	Struck and sunk one of her barges at Augusta.
Sept. 1	Tow-boat *Mary Michael*	Sunk a barge of lumber above Cairo.
3	Light-house boat *Ivy*	Struck a snag and sunk 80 miles above Saint Louis, Mississippi River; was valued $12,000.
13	Sand-boat *Hippopotamus*	Sunk at Pittsburgh.
14	Steamer *Diurnal*	Struck a snag and sunk at Alta, Ind. Was damaged to the amount of $5,000; insured for $3,000.
14	Steamer *C. C. Carroll*	Sunk 7 miles above Glasgow, Missouri River, and was a total loss. Was insured for $10,000; valued at $15,000.
16	Steamer *Idlewild*	Ran into the wharf-boat at Paducah, doing damage to the extent of $1,000.
29	Steamer *Tom Spurlock*	Struck a log and sunk below Huntington.
29	Steamer *White Eagle*	Sunk at Lynxville. Valued at $5,000; no insurance.
29	Steamer *Albert S. Willis*	Struck a snag and sunk in Missouri River near Saint Charles. Was valued at $8,000.

List of accidents on Western waters during the years 1886 *and* 1887—Continued.

Date.		Name of—	Remarks.
1886.			
Oct.	4	Tow-boat *Dick Fulton*	Sunk at Big Grave Creek. Was raised.
	4	Tow-boat *Eugene*	With crane-boat in tow struck and sunk the latter at Three Brothers Island. Boat valued at $2,000; was raised.
	5	Steamer *La Mascotte*	Exploded her boilers 24 miles above Cape Girardeau, burned and sunk. Twenty-six lives were lost. Boat valued at $15,000.
	16	Wharf-boat at Evansville	Caught fire and burned with cargo to the water's edge. Cargo valued at $3,500; wharf-boat valued at $5,000; insurance $2,000.
	21	Steamer *Black Diamond*	Sunk in Missouri River. Four people were lost.
	21	Steamer *C. P. Chouteau*	Struck a snag below steamer *Ste. Genevieve*, tearing a hole in her hull and doing slight damage to herself and cargo.
	30	Tow-boat *Sentinel*	Sunk 90 miles above Memphis. Was valued at $4,500; insured for $3,000.
Nov.	3	The steamer *Coahoma*	Was snagged at Bradley's Landing and damaged $2,500.
	4	Steamer *Ed Richardson*	Struck a hidden obstruction above Natchez and was damaged to the extent of $8,000.
	15	Steamer *George Strecker*	Caught fire while lying at Ironton; was extinguished with little damage.
	17	The steamer *James Lee*	Was snagged at Montgomery Landing and damaged $200.
	22	Steamer *Virgie Lee*	Sunk near Augusta. Could not be raised and was dismantled.
	23	Tow-boat *J. M. Bowel*	Sunk two of her barges loaded with coal below Pittsburgh. Loss $3,000.
Nov.	29	Tow-boat *Florence*	And barge caught fire and burned to the water's edge at Island No. 8.
	30	Steamer *Richmond*	Burned 40 miles above the mouth of Red River. Boat and cargo of 307 bales of cotton total loss. Loss on boat and cargo $15,000; insured.
Dec.	4	Tow-boat *Hornet*	Sunk near Wheeling.
	13	Steamer *J. M. White*	Caught fire and burned while lying at bank. Boat, cargo, and twenty-six lives were lost. Boat valued at $100,000, cargo $90,000; insurance on boat $29,000.
	15	Steamer *Deer Creek*	Was destroyed by fire at Simmsport, La. Valued at $2,000.
	20	Ferry-boat *Three States*	Caught fire and burned away her upper works, causing damage to amount of $10,000; covered by insurance.
	22	Steamer *John G. Fletcher*	Struck a snag near Shreveport and sunk with 300 bales cotton; two lives lost.
	22	Tow-boat *R. S. Hayes*	And four barges caught fire, communicated the same to steamer *Natchez* while lying at wharf at Cairo, and were totally destroyed with all the cargoes; *Natchez*, valued $75,000, insured for $50,000; *Hayes*, valued $60,000, insured for $20,000; barges, $60,000; total loss to boats, barges, and cargo, $400,000.
		Chas. Morgan	Was destroyed by fire at Cincinnati; was valued at $45,000, insured $17,500.
1887.			
Jan.	3	Tow-boat *W. W. O'Neil*	Sunk five produce boats, valued at $25,000.
	11	Steamer *D. L. Tally*	Struck a snag and sunk at Demopolis, on the Tombigbee River, valued at $20,000; no insurance.
	11	Steamer *Lake City*	Exploded her boiler at Greenwood, tearing up the flooring of cabin and doing other damage.
	12	Steamer *New Era*	Sunk at Portsmouth, Ohio.
	13	Steamer *Peninah*	Struck a snag and sunk at Saint Maurice; cargo was saved.
	14	Tow-boat *Delta*	Was struck by cake of ice and sunk at Pittsburgh.
	28	Steamer *E. W. Cole*	Sunk below Pine Bluff.
	29	Steamer *Dora No. 2*	Sunk in 18 feet of water; valued at $3,000.
Feb.	12	Steamer *Charles P. Chouteau*	Parted her hog-chain opposite Vicksburg.
	17	Steamer *Pat Murphy*	Capsized at Memphis; valued at $8,000.
	26	Two coal-boats	Were sunk at Memphis; valued at $3,000.
	26	Steamer *Freddie Robinson*	Struck a snag and sunk 6 miles above Little Rock. Was valued at $10,000; insured.
Mar.	4	Corn boat	Loaded with 3,500 bushels of corn was sunk by high wind at Memphis. Cargo and boat total loss. Value of boat and cargo $4,000.
	8	Steamer *Yazoo City*	And cargo was totally destroyed by fire at Red River.
	25	Steamer *Chesapeake*	Was burned to water's edge and sunk at New Madrid. Was valued at $20,000; insurance, $15,000.
	26	Tow-boat *Buckeye Boy*	Sunk three barges at Manchester, one loaded with salt and two with coal.
	26	Propeller *Boomerang*	Sunk at Hickman.
Apr.	2	Tow-boat *Charlie*	Burst her steam-pipe at Cairo, killing two of her crew.
	6	Barge *Dickey*	Sunk 18 miles above Saint Louis.
	13	Tow-boat *Henry Lourey*	Struck and sunk one of her barges laden with 74,600 bushels of corn near Greenville. Barge and cargo valued at $35,000; total loss.
	18	Steamer *City of Madison*	Backed into and sunk a fuel boat loaded with 3,500 bushels of coal at Cincinnati.
	19	Tow-boats *Raymond*, *Horner*, and *Clinton*.	Collided near Pittsburgh, sinking the latter.

List of accidents on western waters for years 1886 *and* 1887—Continued.

Date.	Name of—	Remarks.
1887.		
Apr. 19	Tow-boat *Onward*	Struck her tow of barges against Steubenville bridge and sunk five of them.
24	Steamer *S. L. Wood*	Struck her chimneys against the bridge at Point Pleasant, knocking them down and breaking in her hurricane roof. She afterwards struck the bridge at Parkersburgh, sinking two of her barges, two flats, and three box boats.
24	Steamer *Issaquena*	Was destroyed by fire at Vicksburg. Valued at $7,000; insured for $3,000.
26	Steamer *H. K. Bedford*	Struck the dam at Granville and sunk; was loaded with lumber. Boat valued at $15,000; insured for $9,000.
May 2	Tow-boat *J. C. Risher*	Exploded her steam-pipe at Pittsburgh, killing one of her crew.
9	The *Eclipse*	Sunk near Fort Berthold.
9	Tow-boat *Port Eads*	Sunk her fuel boat loaded with 8,000 bushels of coal at Gayoso.
14	Barge *Gilmore*	Sunk near Cairo. Valued at $2,250; insured for $1,500.
27	Tow-boat *Jno. A. Woods*	Sunk two of her coal boats at Stack Island.
June 3	Steamer *Queen City*	Caught fire while lying at New Orleans, burnt and sunk. Valued at $15,000; insured for $10,000.
9	Steamer *Little Sandy*	Sunk at Louisville. Insured for $1,000.
13	Tow-boat *J. A. Blackmore*	Struck four of her barges loaded with coal against Cincinnati bridge and sunk them. Value, $6,000.
15	Tow-boat *Mink*	Sunk a barge of salt at Point Pleasant.
15	*Annie P. Silver*	Struck the bank at Kaskaskia and injured her hull.
24	Steamers *Paris C. Brown* and *Grover Cleveland.*	Collided at Nine Mile Point, Lower Mississippi River, damaging the latter to the extent of $1,000.
July 19	Steamer *Ed. J. Gay*	Backed into the ferry-boat *Hattie* at New Orleans, damaging the latter to the extent of $1,000.
19	Steamer *Dora*	Sunk her barge near Saint Charles.
21	Steamer *Dick Jones*	Sunk while lying at bank at Helena.
29	Steamer *Sam P. Jones*	Struck a snag and sunk at Evansville; cargo and boat insured; valued at $25,500.
31	Barge *Iron Clad*	Sunk at Bushberg.
Aug. 3	Steamer *Minnie Herman*	Sunk in Missouri River; total loss.
10	Steamer *Silver Cloud*	And cargo burned at Birmingham, Ky. Valued at $18,000; insured for $12,000.
Sept. 3	Steamer *Eclipse*	Sunk 15 miles below Sioux City; total loss.
8	Ferry-boat *R. J. Whistler*	Struck a pier at Dubuque bridge and was damaged to the extent of $1,200.
9	Tow-boat *D. C. Fogel*	Lost two of her barges by fire at New Orleans.
10	Steamer *Phil Armour*	Sunk at Greenville; was raised.
26	Twenty-five coal boats	Loaded with coal were sunk by the storm at New Orleans; loss, $70,000.
30	Steamer *T. B. Sims*	Was burned to the water's edge 20 miles above Memphis. Boat and cargo valued at $60,000; total loss; boat insured for $15,000; two lives lost.
Oct. 9	Steamer *New South* and transfer boat *W. B. Duncan.*	Collided at Cairo, which caused the sinking of the latter with eight loaded freight cars.
15	A barge of 500 bales of cotton in tow of steamer *Harry.*	Was totally destroyed by fire at mouth of Sunflower River.
17	Tow-boat *Minnie*	Caught fire and was totally destroyed at Newburgh. Valued, $5,000; insured for $4,000.
23	Steamer *W. A. Johnson*	Sunk near Mound City.
25	Steamer *Rosedale*	Sunk near Golconda, Ohio River.
27	Steamer *Alberta*	Was destroyed by fire 130 miles above White River; cargo valued at $25,000, and boat valued at $10,000; total loss; clerk lost his life.
28	Steamer *Rosa Belle*	Sunk at Owensborough.
Nov. 1	Steamer *Home*	Caught fire and was totally destroyed 2 miles above the mouth of White River; cargo and boat valued at $25,000; total loss.
22	Steamer *Chas. P. Chouteau*	Caught fire and was totally destroyed 55 miles below Helena; boat valued at $90,000; insured for $35,000; cargo also total loss.

DANGERS OF WATER TRAVEL.

Travel on the Mississippi and its tributaries, although far safer than in former days, is still not entirely destitute of the element of danger that is said to be necessary to give spice to pleasure, say marine underwriters. Although the fleet of steamers that formerly crowded the water-front of this city, and formed an almost endless line to New Orleans, have been in a great measure superseded by the barge lines and the railroads, a great freight and passenger traffic is still carried on by water, and losses, while far rarer than ever before, are by no means unknown. The assaults by the Engineer Department upon

the insidious sand-bar and the deadly snag and sawyer, have rendered danger from these sources far less threatening than when the river was in its pristine condition, but the victory of art over nature is as yet by no means complete, while the highly combustible nature of the boats and cargoes will always lend an uncertainty to traffic over the Western waters. The changing current of the Mississippi, and the consequent shifting of the bars, is responsible for the principal losses by sinking. The tributaries to the Mississippi are as subject to this danger as that river itself, and the loss from this cause amounts annually to a very considerable sum, although the damage in individual instances is seldom great, as a sunken boat can generally be raised, and the destruction of the cargo is rarely total. Among the losses by sinking that have occurred during the present year, the largest was that of the steamer *H. K. Bedford*, which ran into a dam near Granville on April 26, on the Upper Cumberland, knocked a large hole in her bottom and sunk. Most of her cargo, consisting of lumber, was saved, but the steamer was an entire loss. On May 9 the *Eclipse* struck a sand-bar near Fort Berthold on the Upper Missouri and went to the bottom. Her cargo, of a miscellaneous nature, was seriously damaged by water, but the steamer will probably be raised, and again ply on the Missouri. The *Charley Bowen* was sunk on the Mississippi, but was raised and is now on the river. The other boats that have been sunk during the year are the *Gen. Geo. H. Thompson*, the *Freddie Robinson*, the *Louise*, and the *Pat McLaughlin*, all of small value.

The danger from fire is much the greatest that threatens boats on the river. Owing to the shallowness of the water, and the consequent necessity for light draught, the steamers can not be built with boilers and fire-room far below the water-line and removed from the vicinity of an inflammable cargo, as is the case in ocean steamers. The boats are universally constructed of light wood, which is as inflammable as tinder, and the wonder is that the loss by fire is not tenfold what it has proved to be during the last few years. A number of vessels have been burned during the present year, but, all things considered, the loss has been astonishingly small, lighter than ever before known in the same period of time. The first victim of fire was the steamer *Peninah*, which was burned near H. S. Landing, on the Red River; 300 of the 460 bales of cotton with which she was freighted were saved. On the 8th of March the *Yazoo City* caught fire just above Grand Ecore, on the Red River, and was a total loss. On March 26 the *Chesapeake* was seriously damaged by fire near New Madrid, and on April 24 the *Issequena* caught fire while at the Vicksburg dock, and was nearly completely consumed, with a large loss of cargo. The *Ed Durant, Jr.*, the *Hattie Bliss*, the *H. L. Abbott*, the *Queen City* and the *W. H. Gardner* complete the list.

RESTRICTED RIVER TRAFFIC.

River-men summarize the causes of restricted river traffic as follows:

The enactment of laws that have made investments in steam-vessel property onerous, uncertain, and uninviting. Laws from which all other business interests are singularly free.

The advantages of the railroad in reducing freights at river competing points to the minimum, and recouping such losses from non-competitive and helpless points through maximum rates; advantages that no steam-boat was ever possessed of.

The number of and manner in which railroad bridges are built across the navigable highways, which are an ever-present menace to the steam-boat, the cause of detention and losses, a justification for the maintenance of excessive rates of insurance on vessel and cargo, conditions that operate as an embargo upon the commerce by river, and which threaten still further to depress (unless the law now governing the building of bridges be more rigidly adhered to) by compelling the building of boats suited not so much for the demand of the times or economy in construction as to the dimensions of a bridge, a contingency that Congress and the Secretary of War can best guard against by resolutely refusing to countenance evasions of that law.

Because of the impediments to certain and profitable navigation, such as snags, shoals, shifting currents, and obstructed channels, that cause loss of time, additional expenses, and increased risks, which impediments, the Government possessing the means and the people willing and anxious for their application, should be removed, not dilatorily, but at once, pretty much after the manner of a man who having a ditch to dig for purposes of irrigation or the drainage of a field does it at once, well knowing the cost that follows neglect or delay.

MISCELLANEOUS.

LOW-WATER HARDSHIPS—THE WAGES OF TWENTY-SEVEN HUNDRED MEN CUT OFF.

[From the Saint Louis Globe Democrat.]

The rafting interest of the Upper Mississippi is much larger than many have an idea. In all, the regular raft-boats, ninety in number, plying between Saint Louis and Saint Paul, furnish employment to a small army of men—2,700. Nearly all of these men expect employment up to the last of October, from the 1st of April, but this year has proved a discouraging one on account of the unusual low stage of water. Over one-half of the raft-boats have been forced or went into retirement in preference to fighting sandbanks and other obstructions brought around by the low-water complications. Never before since the days of towing rafts by boats has the low water shut out the boats so early in the season. The majority of the men employed are married and depend on their season's earnings to keep them over from fall until the next spring. Each of the boats employs a captain, who fills the place of first pilot, a clerk, mate, second pilot, engineer, second engineer, ten deck-hands, two firemen, cook, and two helpers, and two runners. The expense of running a raft-boat foots up about $80 per day, including the coal supply. The captain receives from $1,600 to $2,000 per season, because he acts as first pilot, while the others are paid by the month, running from $150 for pilot down to $100 for engineers, and $30 for deckers, making the average expense $2,500 per month. Then, no passenger packet on the river sets a more perfect table than is prepared on the rafters. Most of the 2,700 men find their pay cut off completely by the low water. Raft-towing is, however, rather a profitable business for the owners of boats. A few of the boats are owned by the men who run on them, but the large majority are the property of firms who have saw-mills and lumber-yards, such as the Knapp, Stout & Co. Company, the Schulenburg & Boeckeler Lumber Company, of Saint Louis, and the McDonald Bros., of La Crosse. If a boat has no drawbacks she can average up about $100 per day for her owners on the run between the mouth of the Wisconsin River and Saint Louis. This looks like making money very fast, but it must be considered that there is a trip back to the pineries for which the boat receives nothing, while the expense is just as heavy as if she was towing, and then there is the time spent at the rafting points, waiting to get a tow in running order. This takes from two to five days, so that, after all, the owners of a boat can not count on an average of more than $20 to $25 per day during the running season, which is looked upon as small in the face of the risk and trouble to which the owner is subjected.

The river is undoubtedly securing anew the attention and confidence of capital, and it is largely attributed to the help anticipated from the operations of the interstate-commerce law. A new steamer has been built for service between Saint Louis and Cairo mainly, and is called the *New South*. There are seven boats per week out to Cairo, one making tri-weekly trips to Grand Tower, another making the same number of trips to Cape Girardeau, then the independent weekly packet to Memphis, and in addition an occasional straggler; so that, in all, the competition on this short stretch of water is equal to any in the country. Of these the most prominent and the one now absorbing all the interest, being regarded as the river wonder, is the *New South*, which clears from Evansville at 8 this morning for this port. In every detail of speed she is intended to be superior to the unfortunate *La Mascotte*, to take the place of which she was constructed. For rapidity of movement she is calculated to eclipse any boat since the days of the world-famed *R. E. Lee*. The time that she is expected to make can be better understood when it is known that she is booked for tri-weekly trips between Saint Louis and Paducah, making the running distance 1,500 miles per week. She is a side-wheeler, built expressly for the trade, and valued at $80,000. She was built at Jeffersonville, on the Ohio, by the Howards, and modeled by Capt. J. W. Pierce, of Ontario, Canada, who modeled the *Sunbeam*, *La Mascotte*, and other fast ones. Her dimensions are: 257 feet long; 42 feet 6 inches beam; 7 feet 6 inches depth of hold; 932.95 tons burden; draws 3 feet light; four steel boilers, 28 feet long, 40-inch diameter. Engines 20 inches in diameter and 7½ feet stroke. Donkey engines and all the latest appliances for furnishing steam and water. She has four electric lights, including the headlight, and electric bells from the ladies' cabin to the office. She has, besides, plenty of room in the texas, fifty-two staterooms, two bridal chambers, and nursery.

ESTIMATE OF COST.

For closing to their former height the gaps in the existing levees between Cairo and New Orleans, 8,065,700 cubic yards of earthwork, at 23 cents per yard	$1,855,111
Add for contingencies	164,889
Total for repairs of existing levees	2,020,000

The Erie Canal has cost New York $49,591,852.61. All other canals in the State cost, in round numbers, $79,000,000. The Dominion of Canada, just across our borders, has expended $45,115,649 on the Welland Canal and a few of its branches.

If the State of New York and the Dominion of Canada are able to expend these vast amounts of money, thereby showing their appreciation of water transportation, how much more readily should this great nation of ours expend whatever may be necessary for the improvement of the Mississippi River?

The citizens of Helena, Ark., have subscribed $50,000 to be used in conjunction with $75,000 allowed by the Mississippi Commission for the protection of the levees along the river front at that place.

[From the Missouri Republican.]

There are certainly unmistakable signs of a growing traffic on all sides. There has been nothing rushing, but rather a gradual improvement, seeming to have come to stay, with the promise that the new interstate-commerce law will be strictly enforced. It now seems, as reported by a passenger, that the great river is to again be put to some other use than floating driftwood. The Upper Mississippi press has been a unit in urging the marked advancement already made. The Hawkeye, of Burlington, reports not less than from 25 to 35 per cent. increase as compared to 1886. The pottery works of Liverpool, on the Ohio, are taking advantage of the river route. Formerly all of their product went by the railroad. Now they ship by water to Cairo, thence all the way to Saint Paul, and yet at much less expense than they can by the railroads. A New York firm is now sending jute goods by the coast route to New Orleans, and thence by steamer to Saint Louis, one of the first consignments of the kind arriving by the steamer *Will S. Hayes*. Capt. Henry Keith, commander of the steamer *Wyoming*, said that in his opinion the interstate-commerce law will result in an increased business on the Missouri River; also the business, he said, that has been handled by the Missouri River boats this season has been very heavy, and especially so in imperishable goods, such as hardware, chinaware, etc. Dealers in this class of goods are patronizing the boats on the Missouri more than they have for years. He says a continuance of the improvement will mean the necessity of another boat. Capt. Henry Leyhe, of the Eagle Packet Company's fleet, thought there was little, if any, reason to doubt that the improvement in river traffic had begun to assert itself in a vigorous and unmistakable manner. The new law, if enforced as defined, must, he said, result in returning to the great Mississippi some of its former glory and triumph. He referred to the fact that the tow-boat interests were increasing and every boat of this class was busy, both on the Ohio and Mississippi, something that had not been for years, and that it was very hard to charter or buy a boat. From Saint Paul to Saint Louis there is a mighty boom in the rafting business, and every one of the more than 100 boats is kept constantly busy. There has been more rafted lumber on the Mississippi during May than there has been for any similar month in several years. Before the new law went into effect, much of this lumber went by way of the rail route, while this lumber center will reap no decided advantage from the new condition of things.

SAINT LOUIS LEVEE.

The Saint Louis River frontage is over 19 miles long, and her expenses have been about $3,000,000, the harbor-boat service now costing about $8,000 per annum, or $80,000 since 1877.

Amount expended by the city of Saint Louis:

For construction of wharf, grading dikes, etc., from 1849 to 1887	$2,555,033.70
For cleaning levee and removing obstructions in the river from 1878 to 1887	112,238.42
Total	2,667,272.12

LOW-WATER TROUBLES—NAVIGATION ALMOST SHUT OFF, EXCEPT ON THE MISSOURI.

[From Saint Louis Globe-Democrat.]

The river, on August 13, was still falling, with the water lower than at any time during the season, 2 inches being taken off daily, and no indications whatever of an early rise. With this condition it was not to be wondered that river men were beginning to feel despondent. The long-continued drouth and the exceptionally hot weather, river men said, meant that it would take an unusually heavy and long-continued rainfall to bring the rivers up again to a good boating stage. With the exception of the Tennessee River, all of the rivers in the Northwest and South were feeling the effects of the

drouth, and the Ohio, except the small local boats, is practically cut off from navigation above Evansville, and it is only the light class of boats that are able to get up that high. The Tennessee had been nearly dry, and boating was almost stopped on it until the rains, the effect of which was expected to last but a short time. The Lower Mississippi between Cairo and Memphis is ragged, and boats frequently strike sand-bars when only drawing light. From Saint Louis on to Cairo the situation grows daily more critical, and there is an uncertainty of the arrival of boats, as at several points they are liable to ground, even with the utmost caution on the part of the pilots. The Illinois, in the lower portion, is more shallow than has been known since 1840, and navigation is completely suspended from Saint Louis up. On the upper part of this river the *Rescue* and other small packets make trips between Peoria and Henry City. Canal-boat propellers, coming from Chicago with lumber cargoes, either await a rise or the lumber is shipped by rail. There is much freight, wheat, etc., along the shores of the Illinois that the holders are unable to get to railroad stations. The Upper Mississippi from here to Saint Paul is remarkably low, and it is with no little difficulty that boats running there progress satisfactorily at all. Above Clarksville the only boats running are the Diamond Jo steamers, which, owing to their light draught, are able to go through to Saint Paul, the Saint Louis and Saint Paul Packet Company's boats, the *War Eagle*, *Saint Paul*, and *Gem City*, have all having been forced to the bank by low water, with no certainty as to when they will be able to run again. The only raft-boats running to Saint Louis are the *Bart E. Linehan*, *J. G. Chapman*, *Mountain Belle*, and *Robert Dodds*. All of the others have laid up. The rafting business has indeed been very seriously interferred with, and with two or three exceptions the lumber companies have not been able to get more than one-third or a little more of their anticipated receipts. A low estimate places the shortage in anticipated receipts so far this season at 30,000,000 feet. The side streams of the Upper Mississippi, such as the Saint Croix, Chippewa, Black, and Wisconsin Rivers, which are used exclusively for rafting lumber, are all dead low, and only on one river, the Chippewa, is rafted lumber coming out, and then only with artificial aid by dams. Really, the only exception to the low-water troubles in the West is the turbulent Missouri, which keeps up remarkably well, and navigation between here and Kansas City goes on with little interruption.

VIEWS OF PRESIDENT FRANK GAIENNIE, OF THE SAINT LOUIS MERCHANTS' EXCHANGE.

The arguments for the betterment of the river have been well framed by President Frank Gaiennie, of the Saint Louis Merchants' Exchange, who is exceptionally well equipped with information, and who said: "The importance of the Mississippi River and its navigable tributaries, affording nearly 15,000 miles of inland water navigation to eighteen States and thirteen Territories, and the means of a cheap competing method of transportation to the people of its fertile valleys for their surplus products, and thereby contributing to their welfare and happiness, can hardly be overestimated. Its value is better appreciated when you hear Mr. Albert Fink, in his testimony before the Senate Select Committee on Interstate Commerce, and who is high railroad authority, say, 'The Mississippi River is an important regulator of railroad transportation rates,' etc.; and in answer to the chairman: 'I think you stated that the Mississippi River and the lakes and canals really did regulate the question of transportation to a very large degree, Mr. Fink,' he answered 'They do.'"

These natural water-ways, highways to the sea, placed there by a kind Providence for man's use and benefit, have never received the attention they deserve. For over forty years these rivers have been neglected by the General Government, whose duty it was to see them improved.

Millions have been spent on Eastern rivers and harbors, which was proper and correct and necessary, but it is no excuse for the glaring neglect and indifference to the Mississippi Valley. After repeated meetings and demand by the people of tributary country for the improvement of the Father of Waters, which were unheeded by Congress, a convention was held in Saint Louis in 1881, the largest ever held, and to its demand adequate appropriations were made by Congress for the improvement of Western water ways, and for a few years afterward. Since then opposition has grown bold, and the enemies of cheap transportation have succeeded in defeating the necessary appropriations.

Thus unfairly treated, with meager and almost useless, because not sufficient and continuous, appropriation, the people of the Mississippi Valley, with its only partially improved water transportation, provided by nature and neglected by Government, by their energy and enterprise, producing as they do the largest percentage of grain, tobacco, hogs, cattle, and cotton, have grasped the commercial supremacy of the country.

The domestic commerce of the Mississippi Valley is larger than the entire foreign commerce of all the United States, and will soon have the political control by virtue of hav-

ing the heaviest per cent. of population and 48 per cent. of the electoral vote. With this influence and power it will not much longer permit itself to be trifled with, but will make just and reasonable demands for the improvement of the Mississippi and its navigable tributaries, which when improved and permanently maintained will raise the freight-rate question into the higher phase of business competition, and control by the legitimate rules of supply and demand and different methods of transportation, legislation being only necessary to prevent the greed and rapacity of the combination of chartered organizations when directed to monopolize the channels of transportation at the expense of the people of whom they secure these privileges and by the help of Government aid granted them in the interest of the people.

The improvement of the Mississippi and the consequent increase of trade to the seaboard by the reduction of rates by the river route compelled the trunk lines to meet the river rate. The value of this reduced rate to the farmers in wheat alone from 1881 to 1885, taking the rate to New York and New Orleans, was on the average 6 cents per bushel, at the estimate of the Agricultural Department, for 1885 which was 357,112,000 bushels. A saving of 6 cents on that amount of grain means $21,466,720 more money in the hands of the farmer, to say nothing of the benefits to all other kinds of business.

The improvement of the river and the reduction of rates by the trunk lines compelled the State of New York, in the interest of the manufacturing of New York City, to make the Erie Canal free from tolls, and somehow or other the East has had no fancy or feeling since for voting aid to the Mississippi River.

It is related that a Congressman from New York rose in his place and stated when he cast his vote against the river and harbor bill that he did it by instruction from his constituents, but that his judgment was in favor of voting large appropriations for the Mississippi River. He honors Congress no longer for even saying this much in favor of justice to the West.

The saving in the reduction of rates on grain alone is more than is appropriated in any one year in the river and harbor bill for every harbor in the country.

In view of these facts Congress can not much longer remain blind to the interest of the whole country or much longer delay the necessary appropriations for the permanent improvement of our western water ways; and the permanent improvement of these rivers and lakes and the promotion of artificial ways will be an effectual estoppel upon the combined railroads to tax the products of the country by excessive freight rates at their dictation.

I do not overlook or fail to appreciate the great benefits derived from the building of railroads, nor do I in any way regret the help given by the Government to the railroads in the way of land in the past; but they need no such encouragement now; and every acre of land heretofore donated and not earned should be declared forfeited to the Government, and forever reserved to homesteaders. Railroads keeping pace with the improvements in other methods of transportation have been able to reduce their rates, and under the operation of the interstate-commerce law to competing points exercise a corrective influence upon arbitrary river transportation, the improvements in railroading justifying them even in paralleling the river and maintaining successful competition.

The improvement in water-craft reducing the cost of transportation by water, model tow-boats, with fleets of barges whose broad bottoms make it possible to carry immense cargoes upon ordinary depths of water at small cost, will always maintain an equilibrium of rates to the seaboard.

Saint Louis has the geographical situation as the central city of this Mississippi system of water navigation, and as a railroad center, with ample elevator capacity to store the grain and large capital and business facilities, must be the entrepôt for the products of the Mississippi Valley, seeking and securing the cheapest route to the sea, either by the river to the gulf or by rail to the Atlantic seaboard.

The effect of river competition with the trunk lines of railway is felt where there is no river competition, and the duty of Congress is to promptly repair its neglect of the great river and its navigable tributaries in the interest of the whole people of the Union.

To give you an idea of the transportation from Saint Louis down, not taking upper river or the Missouri into consideration, note this: From the 1st of January, 1887, to the 1st of July, 1887, the barges carried 35,597 tons of package freight, 203,873 tons bulk freight, and the boats 73,525 tons of package freight, making in all 312,995 tons of freight down stream against 431,945 tons for the whole of last year.

For boats and barges up stream last year the tonnage was 173,600 tons. The upstream freight is made out at the close of the year and is not now available.

The down-stream tonnage shows about 50 per cent. increase this year as compared with 1886.

That Congress must heed the voice of the people whom they are supposed to represent and make the necessary and continuous appropriations for the improvement of western water ways will be made plain at the convention to be held in Memphis, Tenn., in October, 1887. The people of the United States demand an improved Mississippi.

LETTER FROM JOHN JACKSON.

The following letter from John Jackson, the capitalist and a chief promoter of the jetties, serves to indicate the interest felt by capital in the further improvement of the Mississippi River:

SAINT LOUIS, *July* 18, 1887.

DEAR SIR: I am pleased to know that you are giving some attention to the Mississippi River, which has, in my opinion, been very much neglected by Uncle Sam. My connection with the jetties was as first subscriber to the work. When the enterprise got into difficulties, at the suggestion of Captain Eads and a large majority of the stockholders, I became president of the South Pass Jetty Company, and continued in that office until 30 feet of water had been obtained and the jetty company dissolved. I mention this to show that I have had some experience in river matters. A good many old river men ridiculed Captain Eads's idea that 30 feet of water could be obtained on any of the bars at the mouth of the Mississippi, but he obtained it just the same, and the same old fogies now distrust the improvement of the river channel. But this is more feasible than the construction of the jetties; that is, if the appropriation can be made large enough to complete the work at given points when once it is undertaken. As the work has been prosecuted little can be expected. Sometimes when a set task or job is about half completed the money gives out, and the labor is lost and washed away.

To illustrate my reasons for being so confident that a deep channel can be obtained from Saint Louis to deep water: The river in front of the city shows what can be done. When I arrived in this city what is known as East Saint Louis was called "Bloody Island." The Mississippi River was divided at the north end of the island, part running east and part west, and that time, in low water, steamers had great difficulty in landing at our levee on account of bars in front of the city. Since the eastern channel has been filled up by the railroads there is always and invariably an abundance of water at our wharves, no matter how low the river may become, demonstrating that the narrowing of the stream deepens the channel. Take Horse Tail Bar as another instance, at the worst point between here and Cairo at low water. The river being very wide at that point boats were constantly getting aground. Since the improvements made by Captain Ernst there is plenty of water there at all seasons of the year; so, at least, boatmen tell me.

It would no doubt take a large amount to improve the river from Saint Louis to deep water. Captain Eads estimated it at $45,000,000, which seems large; but suppose it would lower the rates of freight to New Orleans so as to increase the value of wheat and corn in the entire Mississippi Valley only 1 cent per bushel, that would pay the cost of improvement in a very short time.

The jetties have reduced the rates of freight from New Orleans to Europe very materially, as ships can go out loaded to their full capacity. Before the jetties were finished large vessels could not get out much better than half laden, drawing, say, 16 to 18 feet of water. I see by the papers that ships now go out drawing over 26 feet.

I trust you will, with the aid of indisputable facts and figures, be able to convince the powers that be that it is both expedient and necessary for economic and political reasons to give heed to the clamorous demand of the West for river improvement.

Very truly yours,

JOHN JACKSON.

T. J. MCMINN,
United States Expert.

EFFECTS OF THE INTERSTATE-COMMERCE LAW.

Since the passage of the interstate-commerce law and the institution of the commission the country has been exceptionally prosperous and nearly every branch of business has thriven. Railroad dividends during the current year have shown marked improvement over preceding years for more than a decade, and the month of last July shows an increase over July, 1886, of 8½ per cent. And this is a smaller gain than other months disclose, the average gain being about 15 per cent. Much of this must be, of necessity, attributed to the general thrift of the country, but a large share is doubtless due to the attempted maintenance of rates based upon the new law. Immediately upon the passage of the act, river men became encouraged and water-craft gave unmistakable signs of new life, but the action of the commission in holding in abeyance the operation of the fourth section has filled the boatmen with apprehension, and they seriously question the wisdom of decisions which render a law of none effect, especially as they have been rendered by the very agents appointed to enforce its provisions.e

Nevertheless, some good results are already apparent. The river business generally has increased, and for the first time in a dozen years or more large and important consign-

ments have been made from New York to Saint Louis by all-water route and exporting has assumed new importance. As appears elsewhere, 1887 is showing handsomely in advance of 1886. Certainly if the short-haul rate be even approximately maintained on through lines, and the almost nominal competitive long-haul rate abolished, the effect must be to shut the Western cereals and farm products off from the seaboard by rail route and relegate these great crops to the water ways by barge and boat and cheap freight rates.

And the absence or the partial absence of these products of States west of Indiana, as Illinois, Wisconsin, Minnesota, Kansas, and the rest, from the markets of the East, would inevitably enhance the value of all farm product in all States east of Indiana.

The railroads would then as now enjoy liberal incomes from short-haul rates, and no one could lose but the West. Would the West lose?

She would not, for at no time within the memory of the oldest operator has wheat been lower than now—August 9, 1887.

The cost of transportation will not admit of export after shipment to the seaboard by rail.

We must have cheaper shipping facilities or the farmer must turn his attention to something beside grain. But railways, with the demands there are upon them, can not afford to haul for lower rates than now prevail, and the close of navigation in the North will soon so crowd their lines with traffic that an advance in rates is certain to follow, and every advance in freight is so much off the grain.

The deepening of the Mississippi would afford the cheap outlet that has become indispensably necessary if our crop is successfully to compete at all with India and Russia, and a deepened channel would speedily relieve the plethoric elevators, whose bursting bins are now so sorely depressing prices.

If a uniform depth of, say, 9 feet were maintained, and it is elsewhere herein abundantly demonstrated that it can be secured, between Saint Louis and New Orleans, it is safe to predict that no extortion would ever again be practiced upon the agriculturist, for the river is anybody's highway, and much of the idle capital of the country would naturally and inevitably seek investment on a safe stream with the assured traffic of the inexhaustible Valley of Mississippi.

Competition, broad bottoms, immense cargoes, and the accretion of business now going by rail, would, almost to a demonstration, lead to a revival of a well-nigh obsolete industry, and save to the farmers more in one year than would pay for the improvement of the river, and it would insure future relief from the arbitrary taxation of cereals by those who own the main outlets to the east, and river laborers could compete with the Indian and the Russian and employment would be furnished to many who now vainly look to the idle waters for support.

Another fact should not be overlooked; many points on western water-ways have no other means of shipment than the river, and a hurt to the river is a stab at the agriculturalist who looks to the river for access to the world.

The entire New Madrid Bend of the Mississippi, for instance, comprised of the very best farm land on the continent, is subject to all inconveniences and losses incident to a policy injurious to river interest, and New Madrid only stands for a large class of towns that in the aggregate represent millions of business, though they have absolutely no voice in transportation matters of vital interest to them.

The enforcement of the interstate law would, by building up and protecting river traffic, be a means of greatly enhancing all farm values bordering upon inland water, and the West would thus reap benefit in common with the East and the railways.

Respectfully,

T. J. McMinn.

THE ILLINOIS RIVER.

A considerable business comes from the Illinois River by the Naples Packet Company and other boats, and at times considerable freight is moved by this river and the canal between Saint Louis and Chicago. The boats engaged in the trade during the past year were:

Steamer.	Line.	Running to—
Calhoun	Naples Packet Company	Peoria or Naples.
Mattie Belle	do	Do.
City of Alma		Do.
C. W. Anderson		Do.
Polar Wave	Tow-boat	Peru.
Polar Star	Propeller	Chicago.
Niagara	do	Do.
Mohawk Belle	do	Do.
Imperial	do	Do.

THE MISSOURI RIVER.

The Missouri River as a means of transportation shows its relative importance in the subjoined tables, and it will be seen that the course of the stream, considered together with the facts of rich contiguous territory and the presence of great cities upon its banks, the river is really more remarkable for what is not done than for the traffic carried on.

The explanation is that it meets the severest railroad competition, and is handicapped by the most tortuous, treacherous, and obstructed channel with which boatmen have to contend anywhere. It is worse than the Mississippi, and has received less attention from the Government, and the losses discourage river men.

Steamboats could not compete with a railroad on either bank, and where in 1866 there were in active service 71 steamers, there are now but 7 steamers and three tow-boats, and these only ply between Saint Louis and Kansas City, and intermediate points, as follows:

Steamer.	Line.	Running to—
Dacotah	Saint Louis and Kansas City Electric Packet Company.	Kansas City and below.
Wyoming	do	Do.
D. R. Powell	do	Do.
C. C. Carroll	do	Do.
General Meade	Augusta Packet	Augusta.
New Haven	Portland Packet	Portland.
Dora No. 2	do	Do.
Last Chance	Towboat	Lower Missouri River.
A. S. Willis	do	Do.
O. C.	do	Do.

OMAHA.

[From the Omaha Daily Bee, January 1, 1888.]

Omaha during the year 1887 expended for public improvements, packing houses, factories, banking and business houses, school buildings, churches, and dwellings, a grand total of $12,413,529 as against $7,230,738 during 1886. Of this amount $3,943,519 represent public improvement, both by the city and corporations which hold public franchises. The city's quota of these improvements—for pavements, sewers, grading, etc.—foots up $1,329,148. The expenditure for bank buildings, stores and business houses, school buildings, churches, factories, mills, packing houses, and dwellings, aggregates $8,470,010. There were constructed in Omaha during the year 1887, 2,546 buildings of every description, of which 2,179 were dwellings and residence blocks; 272 bank buildings, hotels, and stores; 13 public corporation buildings; 36 factories, mills, packing houses, and manufactory enlargements; 28 churches and parsonage buildings, and 18 school buildings.

COMMERCIAL GROWTH.

Omaha's commercial growth is practically exhibited by her wholesale trade, bank clearings, and industrial statistics. By comparison with our annual review for 1885, we find that the wholesale trade of Omaha has nearly doubled within three years and her bank clearings have more than doubled within that period. In 1884 the wholesale trade of Omaha, exclusive of sales of commission houses, coal dealers, and agricultural implement houses, which are not strictly wholesale, aggregated $20,250,890, and including coal, commission, and implement sales, $24,382,891. During 1887 the wholesale traffic of Omaha, exclusive of coal commission and implement sales, aggregates $37,863,500, and including commission, coal, and implement sales, $44,216,000. This represents a gain of 15 per cent. over sales of 1886.

The Omaha bank clearings for the year 1887 aggregate $147,414,148.71 as against $93,793,835 during 1886.

A carefully compiled summary of Omaha's wholesale traffic for 1887 is embodied in the following summary:

Groceries and provisions	$8,910,000	Hats, caps, and gloves	$430,000
Lumber	7,330,000	Confectionery	415,000
Agricultural implements, carriages, and wagons	2,775,000	Seeds	330,000
Dry goods and notions	2,610,000	Books and stationery	325,000
Steam, water, and railway supplies	2,375,000	Millinery and fancy goods	305,000
Hardware, iron and wagon stock	2,260,000	Rubber goods	235,000
Coal and coke	1,727,000	Jewelry	215,000
Metals, tin plate and tinners' supplies	375,000	Clothing and woolens	200,000
Commission and produce	1,839,500	Wall paper	210,000
Boots and shoes	1,425,000	Paper	150,000
Wines and liquors	1,420,000	Crockery and glassware	140,000
Drugs and druggists' goods	1,350,000	Guns and sporting goods	130,000
Leather, hides, and pelts	995,000	Vinegar and pickles	130,000
Teas, coffees, and spices	895,000	Musical instruments	125,000
Cigars and tobacco	890,000	Leaf tobacco	120,000
Furniture	755,000	Auction and commission	50,000
Illuminating oils	780,000	Refined sirups	50,000
Saddlery hardware and findings	635,000	Butchers' supplies	50,000
Flour and feed	540,000	Toys and willow ware	45,000
Butter and eggs	440,000	Total	44,216,000
Paints, oils, and glass	235,000		

MANUFACTURES.

Omaha is now the leading industrial city west of Chicago. Her machine-shops, founderies, breweries, distilleries, white-lead works, silver-refining works, factories, and meat-packing houses give employment to 7,249 men and women. Re-enforced by the 2,051 laborers employed last summer in the Omaha brick-yards, this army of industrial wage-workers would number 9,300. Omaha now contains several of the most extensive manufacturing establishments in America. Her silver-smelting works are the largest works of this class in the world, her linseed-oil works rival in magnitude the largest oil mills in America, and her distillery ranks as the fourth largest in the United States. Her beef and hog product packing houses are only second in capacity to those of Chicago. The aggregate product of Omaha industrial establishments during the past year, exclusive of the product of packing houses, is computed at $20,725,000.

AS A PORK AND STOCK MARKET.

Omaha now ranks as the third largest pork market in America, and her beef-packing industry has reached a magnitude that warrants the prediction that within ten years she will outstrip all rivals.

The number of cattle, hogs, and sheep handled in the stock yards during the year is computed at 1,324,443, which is an increase of more than 200 per cent. over the preceding year. According to the official packers' statement, there were slaughtered and converted into meat products 871,693 hogs, 65,725 beeves, and 52,800 sheep, aggregating in value, $13,708,124.45. This is an increase of 300 per cent. over the packing exhibit for 1886.

Early in 1884 a number of gentlemen associated themselves together with a view to the development of the live-stock market facilities of Omaha. The outcome was the organization of two separate companies, composed chiefly of the same parties and including in their number some of the most enterprising capitalists of Omaha, Chicago, Cheyenne, Boston, and Saint Louis. It was intended that these two companies, known as the

Union Stock-Yards Company and the South Omaha Land Syndicate, should work in harmony with each other, and they purchased a large tract of land lying immediately south of the city limits of Omaha. The Stock-Yards Company commenced the building of yards, while the land syndicate laid out a town site, giving it the name of South Omaha, where the employés at the yards might build themselves homes. The capital of the Stock-Yards company has been increased to $2,000,000. The yards were first opened for business on August 25, 1884. During the year 1885 $300,545.44 was expended in increasing the facilities. In 1886 $20,000 was spent in the building of additional hog and cattle pens alone; $10,000 or more on a system of water-works; $36,000 on the completion of the Stock Exchange building. . Large sums were also expended in the erection of new packing-houses, and $50,000 have been invested in building new pens to accommodate the rapidly increasing receipts of live stock, until at present the yards cover 25 acres of ground and have a yardage capacity of 15,000 to 20,000 hogs, 10,000 cattle, and 5,000 to 10,000 sheep.

During the month of September a census was taken in South Omaha, which showed a population of 6,345, which has increased at least 1,000 since that time, and the city is now the third pork-packing center in the United States.

THE GRAIN TRADE.

The receipts and shipments of cereals in Omaha, especially of corn, have during 1887 greatly exceeded those of any previous year. The vast area of corn-producing land in Nebraska has naturally made Omaha the receiving point for the product, and with the excellent elevator facilities of the city, and the prospects of additional ones, there is little doubt that Omaha will soon take a first place among the corn centers of the country. New railway lines terminating at this point have opened up a new, vast, and fertile country, and while corn at present is the leading grain handled, there is no doubt that this market will soon become celebrated for its wheat and other small-grain shipments.

The distillers and brewers furnish a cash market of considerable magnitude. They buy direct from country dealers and store the grain in their own warehouses. The Willow Springs distillery during the past year used no less than 650,000 bushels of corn, and the three leading breweries malted 350,000 bushels of barley. The Omaha Horse Railway Company also buys direct, and has during the year 1887 purchased over 100,000 bushels of corn and oats. The local flour and feed mills have purchased 300,000 bushels of wheat and corn, and it is expected that during the present year this consumption will be doubled by the erection of two new mills of great capacity. Himebaugh & Merriam, proprietors of the Union Elevator, report an active trade during the past year. The capacity of their elevators is nearly 1,000,000 bushels. They handled during the year 1887 the following: Corn, 4,048,206 bushels; wheat, 649,736 bushels; rye, 11,883 bushels; flax, 4,389 bushels; barley, 188,155 bushels; oats, 748,061 bushels.

LABOR STATISTICS.

The following statement shows the number of men engaged in the several trades throughout the city: Bricklayers, 528; plasterers, 195; stonecutters, 120; cornice-makers and tinsmiths, 135; plumbers, steam and gas-fitters, 170; brick-molders and setters, 170; painters and paper-hangers, 550; carpenters, 1,040; machinists in Union Pacific shops, 410; other machinists, 310; iron molders, 110; horseshoers, 54; blacksmiths, 75; bakers, 125; harness-makers, 140; tailors, 175; shoe-makers, 50; carriage-makers, 45; carriage-ironers, 35; carriage painters, 65; slaters, 15; collar-makers, 25; lathers, 100; cigar-makers, 175; candy-makers, 100; coopers, 65; laborers, 1,750.

The Union Pacific shops employ 1,064 men and the South Omaha packing-houses 1,600.

THE NEW UNION PACIFIC BRIDGE.

The magnificent new steel bridge between Omaha and Council Bluffs, built by the Union Pacific Company, was completed Friday, November 10, 1887. It is one of the finest structures in the world, as well as one of the largest. Besides two tracks there is a wagon road and a foot-path on either side.

The work was commenced in October, 1885, and from that time until its completion an average of 125 men were employed. The work was done under the direct supervision of Chief Engineer George S. Morrison, who made the original designs. The bridge is 1,750 feet in length, and has ten spans. Four of these are 250 feet in length and the remaining six, three at each end, are deck-spans 125 feet each in length. The floor of the bridge is 66 feet above low water. The width over all is 54 feet. The width of the roadways are 7 feet each, and of the foot-paths 3 feet. The four main or central spans rest upon colossal granite piers, the total height of each being 140 feet, 74 feet being beneath the level of low water. The length of each pier is 55 feet at the water and 43 feet

at the coping. The thickness of the piers range from 12 to 8 feet. The bridge will stand a pressure of over 4 tons to the square foot. The exact cost of the structure is not yet known, but it will approximate $900,000.

The old bridge, which was considered at the time of its erection the finest structure west of the Mississippi, was a small affair compared with the new one. Yet its cost was over $2,500,000, nearly three times as much as the new one. The work of construction was commenced in November, 1869, and was not completed until March 25, 1873. It was 2,752 feet long and had eleven spans. It was built of iron. The elevation was 50 feet above high-water mark.

COUNCIL BLUFFS.

We are indebted to Mr. E. H. Odell, secretary of the Board of Trade of Council Bluffs, for the following statement of the commerce of that city for the year 1887:

"The general business activity for the year 1887 has been greater than the year preceding it, and the total results show a very favorable increase. Particularly has it been so in the line of agricultural implements, which last year amounted to the enormous sum of $10,000,000, keeping Council Bluffs still in the enviable position of the second greatest distributing point for agricultural implements in the world, Kansas City being the first. This has been accomplished without the addition of any new wholesale houses, although at least two eastern manufacturing companies had determined upon establishing branches here during the year. The increased business came largely from the old territory, showing a very healthy condition of the farming interest of the Western States, but nearly all the houses have increased their traveling force of salesmen and invaded new territory.

There has been a healthy growth in the local manufacturing interests, several new factories having been located here, and all of the old ones enjoying increased prosperity. This will reach a total of over $3,500,000. This, added to the wholesale trade of every character, will round up $25,000,000. The real estate transfers for the year have been unprecedented in the history of the city, being more than three times the gross aggregate of the year preceding. The city improvements have also doubled, and including the private building, will reach more than $1,000,000. There have been the largest number of homes built that has ever been reached in the aggregate of any three years of the city's history in the past. These houses, which will range in cost from $1,000 to $10,000, were not built by speculators for tenement purposes but by bona fide citizens for homes, the majority of them by people newly arrived in the city. The peopling of these new houses with people has added fully 5,000 to the city's population during the year. Street car lines have been extended at a cost of over $10,000. The extension of the water-works has been nearly as great. Two hundred thousand dollars' worth of street paving has been laid and nearly 7 miles of new sewers built. In addition to this nearly 20 miles of new streets have been graded preparatory to paving this year. For this and other filling work more than 500,000 loads of earth have been hauled from the hills, giving employment to a large number of men and teams, and extending the city in two directions.

The grand total of the city's business for the year will reach $40,000,000 in round numbers.

Among the most important improvements that the year has witnessed has been the completion of the new $2,000,000 steel railway and thoroughfare bridge built by the Union Pacific Railway Company, connecting Council Bluffs with Omaha, and substantial commencement of the exclusive thoroughfare bridge connecting Broadway, Council Bluffs, with Douglas Street, Omaha, and which is contracted to be completed by the 10th of next June.

The Union Pacific bridge is a double-track structure 65 feet wide, and has two wagon ways and street car tracks, and two foot passage ways. The second bridge will be a lighter structure but will be one of the finest bridges over the Missouri River, and the only exclusive thoroughfare bridge over that stream.

Altogether, the year has been the most prosperous the city has ever known, and if the promises of the new year are realized 1888 will witness an increase all around that will be fully as satisfactory as the past year.

The population of Council Bluffs is now (January 1, 1888) 30,000.

SAINT JOSEPH, MO.

Situated on Missouri River, contributes to some extent to Mississippi commerce. Population, 70,000; 170 factories, nearly all established within ten years; residents own about nine-tenths of invested capital; products sold mostly in Kansas, Nebraska, Colorado, New Mexico; annual wages paid $2,891,400; river navigation having of late years well nigh suspended or fallen into disuse, the close of the river has no appreciable effect on business. Being a port of entry, Saint Joseph receives supplies in bulk from Europe, and also from New York, Chicago, and Saint Louis, and distributes her wares and merchandise to California, Utah, and the Southwest.

BRIEF HISTORICAL REVIEW.

In the year 1803, Joseph Robidoux, the founder of the city of Saint Joseph, which he named in honor of his "patron saint," pitched his tent on the "Black Snake Hills," in the heart of the famous "Platte Purchase," in the State of Missouri. This was the natural and established direct outlet for all the country east of the Missouri River, to the vast and then but little explored fields of the "Great West." After its occupation by this sturdy and resolute pioneer, it soon became the trading and supply depot for the numerous Indian tribes of the "Great American Plains" and the hardy pioneers of the Rocky Mountains. When visited, in the year 1843, by the great naturalist, Audubon, on his way to the Yellowstone, that part of the narrative of his explorations in which he spoke of the "Black Snake Hills" is especially interesting because eminently prophetic. He wrote: "We reached the Black Snake Hills settlement, which is a delightful site for a populous city, which will be here some fifty years hence." Mr. Robidoux had selected this spot on account of its natural and central advantages and the richness and extent of the country surrounding it upon all sides. Now, however, inspired by the words of the great naturalist, and after a lonely but profitable occupation of forty years, he pre-empted the 160 acres of land upon which he was heretofore but a "squatter," and laid out the town of Saint Joseph. It fast grew in municipal importance, and on the 26th day of February, 1845, became duly incorporated.

In the year 1849 the historical gold excitement which thrilled the nerves of the entire country, filled the town with a busy population of emigrants, arriving and departing for the gold fields of California. This was the great gateway of access to the famous El Dorado, reposing beneath the splendors of the setting sun, and it profited largely in the equipment and fitting out of trains which daily departed thitherward. Thus in the year 1851 the town had attained a population of some 4,000, and the inhabitants took upon themselves the dignity and importance of a city, its first charter bearing date February 22, 1851. This date and month was a propitious omen for the welfare of the giant then born, as it was for the nativity of the "Father of His Country;" and but little did the inhabitants of the embryonic city then dream that it was also to mark the completion of the Hannibal and Saint Joseph Railroad in 1859—the first railroad of the country penetrating so far west. The city continued to progress steadily and surely, and because of the solid and substantial base upon which she is founded will so continue in an ever-increasing ratio. She can have no back-sets, because she will have no inflations. What she is she has become of her own native plasticity, and as she continues to grow and prosper, as she inevitably must, she will attract more and more, as is now evinced by the tide set in, of that outside capital and immigration which has built up other cities of the West, but on the basis of speculation and with comparatively inferior advantages. When those places, now in seeming ascendancy, will fail to support the uncertain fabrics of their ephemeral growth, Saint Joseph will be growing stronger and greater, until within the time of the present generation she will be the great city of the Missouri Valley, without a peer as to commercial supremacy and metropolitan magnificence. See the steady and increasing growth of the past.

Population of Saint Joseph.

Year.	Population.	Year.	Population.
1845	600	1882	40,000
1850	3,450	1883	43,000
1860	8,500	1884	50,000
1865	9,500	1885	57,000
1870	19,565	1886	65,000
1880	32,431	1887	70,000
1881	38,000		

THE TRADE OF 1886 AND 1887.

The year 1887 overtopped all previous ones, there being an actual increase of over $13,000,000 in the sales of wholesalers and retailers. The table which is appended gives

a concise statement, comparative with the showing made by the secretary of the board of trade in his annual report for 1887:

	1887.	1886.		1887.	1886.
Dry goods	$14,216,529	$13,201,000	Leather findings	$437,410	$418,140
Groceries	16,104,685	15,225,000	Oysters, fish, game, and meat	492,350	475,000
Hardware, iron, cutlery	5,625,000	5,400,000	Sewing machines	95,000	88,500
Lumber and building material	6,422,000	5,778,000	Musical instruments	210,040	187,820
Grain and produce	6,520,000	6,759,000	Bottled beer, cider, etc	325,760	300,890
Live stock	6,492,000	5,000,000	Cooperage, boxes, and work	143,450	115,000
Machinery and agricultural implements	3,965,675	3,332,500	Guns, pistols, and sporting goods	84,000	79,075
Wines and liquors	2,042,080	1,868,400	Coffins and undertaking	50,000	45,000
Clothing	2,845,012	2,356,250	Merchant tailoring	295,000	271,080
Boots and shoes	2,271,600	2,378,700	Livery and boarding stables	274,350	239,400
Drugs, paints, and oils	2,532,484	1,618,400	Restaurants and hotels	579,000	496,000
Tobacco and cigars	1,630,000	1,300,250	Brick	720,650	486,490
Wools, tallow, and furs	1,592,500	1,345,500	Trunks and satchels	100,000	91,700
Saddlery and harness	1,802,400	1,650,200	Flour, feed, and mill stuffs	3,600,000	3,300,000

STATISTICS OF MANUFACTURES IN SAINT JOSEPH.

There has been a more decided increase in this line of industry than ever before. During the year just ended there have been established in Saint Joseph several new manufactories in new lines of goods, and several other institutions are now looking in this direction. The following table gives the increase in each line, together with the total value of the products:

Kind of manufactures.	Capital invested.	Value of products.		Number employés.	Aggregate wages per month.
		1886.	1887.		
Refineries	$250,000	$650,000	$700,000	265	$2,800
Woolen goods	425,000	475,000	490,000	250	9,000
Flour and feed	700,000	1,500,000	1,840,000	200	12,000
Breweries and bottling	750,000	650,000	775,000	250	7,000
Foundries, machines, cars, etc	1,500,000	2,110,000	2,525,000	1,300	58,000
Stoves	50,000	50,000	65,000	40	2,600
Furniture and show cases	300,000	975,000	1,110,000	325	18,000
Brick	300,000	425,000	575,000	350	10,500
Crackers and confectioneries	350,000	2,200,000	2,000,000	1,600	30,000
Stone and marble	135,000	550,000	615,000	360	1,250
Harness and saddlery	175,000	300,000	325,000	175	5,000
Printing, publishing, and binding	250,000	400,000	425,000	450	18,000

Excess over 1886	.....	.....	4,396,000	.....	.....

THE NEW STOCK YARDS.

The Saint Joseph stock-yards were formally opened December 1, 1887. These stock-yards comprise 440 acres of land just south of the city limits, and were built at a cost approximating $1,000,000. [This does not include the value of the property, etc.] The result is a vast acreage of cattle, hog, horse, and mule pens, and an exchange building that is as fine as can be found in the West. In addition to this, the company has its own line of railway tracks fronting the yards, and innumerable switches and side tracks. All the thirteen trunk lines running into the city are under a contract to use these sheds for twenty-five years, thus securing permanency to packers as well as to the stock-yard owners.

The water system is elaborate, the sewerage is of the most approved underground pattern, and at full pressure carries all of the refuse to the river.

THE RAILROADS.

Saint Joseph's fourteen railroads radiate from a common center to every point of the compass—Four great lines to the west: The Atchison, Topeka and Santa Fé; the Burlington and Missouri River; the Chicago, Kansas and Nebraska, and the Saint Joseph and Grand Island. Three to the north: The Kansas City, Saint Joseph and Council Bluffs; the Saint Joseph and Des Moines, and the Chicago, Saint Paul and Kansas City. Four to the east: The Hannibal and Saint Joseph; the Chicago, Rock Island and Pacific; the Chicago, Burlington and Quincy, and the Chicago, Milwaukee and Saint Paul. Three to the south: The Missouri Pacific, the Wabash, and the Saint Joseph and Saint Louis.

SAINT JOSEPH BRIDGE.

The bridge across the Missouri River at Saint Joseph was completed in May, 1873, and on the 20th of that month the first locomotive crossed the bridge. The amount of traffic over it from October 1, 1886, to September 30, 1887, not including, of course, the traffic of the Saint Joseph and Grand Island or Chicago, Kansas, and Nebraska Railroads, the trains of both of which cross the bridge, is as follows: Sand teams, 21,160; sheep and hogs, 105; horses and cattle, 2,055; four horses and vehicle, 46; two horses and vehicle, 13,070; one horse and vehicle, 3,875; horsemen, 18,037; footmen, 15,460.

BANKS.

There are seven banks in the city of Saint Joseph, with an aggregate capital and surplus of $1,105,000, which on September 1, 1887, had on deposit in the aggregate $7,675,000. Bank clearances for 1887, $71,530,497, showing an increase of 7 per cent. over the clearances of 1886.

KANSAS CITY.

By the water ways Kansas City ought to contribute largely to the commerce of the Mississippi River, but the railways have so diverted traffic that the great river receives comparatively little by way of the Missouri, the natural avenue of Kansas City contributions. The commercial growth of this center of trade is without parallel in America, and doubtless is not surpassed in the history of the world, in view of the little time occupied in attaining her present stupendous proportions. Kansas City is more nearly a rival than a tributary of Saint Louis, which latter point is of paramount importance in the distribution of Mississippi River traffic; so that a glance at the growth and magnitude of Kansas City business is largely valuable as an indication of what might have been, or may be, or should be, accomplished by water transportation. Below tables will be found indicating the direction of freight movement, and I mention it to fix attention to the fact that the river traffic does not rise to the dignity of recognition.

The story of the growth of Kansas City is known to all the country and is the pride of the West, and an extended detail of its development would be superfluous, but its recent strides are worth attention as significant of a commercial importance second to very few cities in the Union.

The population increased from 113,736 in 1884 to 128,474 in 1885, while the assessed valuation, which represents not over one-third the real, increased from $33,900,000 in 1884 to about $39,000,000 in 1885. The number of new buildings erected during the year 1885, for which permits were issued, was 2,914, costing $5,758,629, as against 2,121, costing $3,562,788, in 1884, and 1,192, costing $2,583,295, in 1883. The cash receipts at the post-office increased from $227,149.05 in 1884 to $233,862.95 in 1885, and the total number of pieces of mail handled by the carriers increased from 17,136,008 in 1884 to

20,185,702 in 1885. The transfer of real estate, which is closely connected with city development and a good reflection of the confidence investors feel in the future of the city, amounted to $17,774,700 as against $12,120,840 in 1884 and $8,601,936 in 1883. Decreases in some things may be as significant of progress as increases in others. The public city debt in 1885 was but $965,000 as against $1,045,128.75 in 1884 and $1,095,-166.75 in 1883.

But 1886 and 1887 were years of signal triumph for Kansas City. Money has poured in freely from all quarters for real estate investments, and the land for 2 or 3 miles around the city has been platted and sold and much of it built upon. Property in the business part of the city has advanced in value fully 100 per cent. within the eighteen months—much of it more than that—while in the residence part of the city and adjacent to and on the lines of business development it has advanced more. Unimproved property has increased in value much more rapidly, advances in some cases exceeding 1,000 per cent. Still, with all these advances, business and good residence property in Kansas City is not so high priced as in some other growing cities of equal magnitude, and may go much higher as she approaches the commercial destiny which the future holds in store for her. The record of transactions in real estate presents an exceptional state of facts. From a business aggregating $11,261,781 for the year ending June 30, 1885, it increased to $39,181,732 for the year ending June 30, 1886, and swelled to the enormous aggregate of $88,302,637 for the year ending June 30, 1887. Much of this business was speculative, undoubtedly, but it had a substantial basis in the demand of increasing population for homes and places of business. The population increased from 128,476 in June, 1885, reckoned on a basis of three and one-half to the name in the directory, to 165,924 in June, 1887, reckoned on the basis of three to the name. The number of new houses built during the year 1886 was 4,054, costing $10,393,207, and during the year ending June 30, 1887, it was 5,889, costing $12,839,868. The assessed valuations, which are about 40 per cent. of actual values, increased from $31,678,520 in 1885 to $53,017,290 in 1887, without any new valuation of real estate. The gross receipts at the post-office, which had been $233,862.95 for the calendar year 1885, increased to $311,949.09 for the fiscal year 1887. That this rapid growth was sustained by a corresponding increase of business is shown in the transactions of the clearing-house which, from $204,333,144 during the year ending June 30, 1885, increased to $353,895,458 during the year ending June 30, 1887. Early in the year 1887 Kansas City passed New Orleans in the magnitude of her clearings and took rank as the tenth city in the United States, only New York, Boston, Chicago, Philadelphia, San Francisco, Saint Louis, Baltimore, Cincinnati, and Pittsburgh, in the order named, exceeding her in this respect. For several months she has nearly equaled Pittsburgh, with a much larger per cent. of increase over the preceding year, and at the present ratio of increase will soon pass Pittsburgh and Cincinnati. This rapid development and growth of business at Kansas City is not due so much to local causes as to the concentration of business at this point incident to the growth of the country, the expansion of our railway system, and the more commanding position of the city. At the date of the last trade report the assessed valuations of the States and Territories with which she traded was $2,256,577,209 and it is now $2,588,709,615, an increase of $338,-132,406. Into the States and Territories commercially tributary to Kansas City is now pouring the accumulated surplus wealth of the East and the best, most energetic, intelligent and enterprising people of that part of the nation and of Europe.

Statement showing the population of Kansas City at different periods.

Year.	Population.	Year.	Population.
1838	300	1877	41,786
1846	700	1878	50,126
1855	300	1879	60,372
1857	2,000	1880	62,977
1858	5,185	1881	80,000
1859	8,000	1882	81,040
1865	5,000	1883	93,773
1870	32,000	1884	113,736
1871	36,000	1885	128,476
1872	40,115	1886	132,216
1873	40,740	1887	165,924

FINANCE.

And the growth in population and real-estate values is well sustained, for in no other respect has the city shown greater progress than in the growth of banking and financial institutions, the basis of all business. Banking capital increased from $3,870,000 to $6,950,000,

an increase of nearly 100 per cent., and the operations of these institutions, confined strictly to commercial business as they were, measures the magnitude of commerce as nothing else can measure it. In view of this fact, the deposits and loans of the banks and the transactions of the clearing-house are significant. The bank statement, June 15, shows the following condition as compared with 1886:

	1886.	1887.
Deposits	$11,249,750	$21,289,188
Loans	8,024,975	14,278,022
Specie	832,460	1,914,190
Legal tenders	945,361	1,604,780

This statement shows a percentage of increase of loans and deposits almost equal to that of banking capital, showing that the business of the people increased in equal degree to the increase of banking facilities. The clearing-house record shows transactions of $353,895,458 for the year ending June 30, 1887, as against $251,963,441 for the preceding year, an increase of a little over $101,000,000. As significant of the growth of business in Kansas City for the past eight years, the following statement of the percentage of increase of clearings each year over the year next preceding is submitted:

Year.	Per cent.	Year.	Per cent.
1879-'80	60.62	1883-'84	22.66
1880-'81	25.70	1884-'85	38.43
1881-'82	32.44	1885-'86	23.26
1882-'83	48.24	1886-'87	40.45

Statement showing the assessed valuation of Kansas City at different periods.

Year.	Valuation.	Year.	Valuation.
1846	$500,000	1874	$12,257,730
1858	1,802,000	1875	11,728,650
1861	1,814,320	1876	8,923,190
1862	1,448,284	1877	9,370,287
1863	1,313,790	1878	9,092,320
1864	1,698,460	1879	10,606,660
1865	1,922,670	1880	13,378,950
1866	3,587,875	1881	17,308,750
1867	3,710,813	1882	24,316,020
1868	5,978,068	1883	26,755,315
1869	8,408,111	1884	30,900,000
1870	9,629,455	1885	31,678,520
1871	10,191,910	1886	46,386,790
1872	10,957,250	1887	53,017,290
1873	12,708,290		

TRANSPORTATION.

There were few important changes in rates during the past eighteen months affecting the trade of the city. For a time during the summer and fall of 1886 a rate war existed in Southern Kansas which, while it lasted, made lower rates for shippers at other points than for those at Kansas City, and it was adjusted just before the close of the year in a manner not wholly satisfactory to her people. The roads to the northwest have made some changes in rates to the detriment of trade in Northern Kansas and Nebraska, which rates they still maintain. The high rates and discriminating practices existing formerly are still complained of by Kansas City merchants—and ascribed to the southwestern pool—though ostensibly abolished by the interstate-commerce law. A little more than a year ago the board undertook to secure some desired changes in rates, and to that end organized as a department of the exchange, a board of transportation, which, it was hoped, might effect the desired changes and provide a ready means of adjustment of all disputes between its members and the railroads. Considerable work has been done in that direction, but so far without notable results.

The question of freight rates has become a serious one. The opening of the year found the board and the commercial community of Kansas City engaged in an effort to secure

lower and more equitable rates. The effort has been continued more or less throughout the year without effect. The rates in this locality are higher than in any other point of the United States, and are full of inequalities and discriminations. The effect is very depressing to all productive industry and confusing and damaging to business.

Statement showing the published tariff rate during 1886 *from Kansas City to principal points of shipment.*

MANUFACTURES.

[From the Kansas City Journal, January 1, 1888.]

The year 1887 will always be known as the beginning of the manufacturing era of Kansas City. During that year 79 new factories started with a combined capital of $5,154,000, employing 2,878 hands. This, added to the enterprises already in active operation, made a total of 373 factories, having a capital of $11,906,000, employing 13,514 hands, and with an output for the year valued at $29,950,000. This is apparently a small per cent. of increase in the output as compared with the increase in the capital invested, but at least $3,000,000 of this capital is in factories that did not begin operations until near the close of the year.

RAILROADS.

The following table gives the number of miles of road constructed each year since 1867:

Year.	Miles built.	Year.	Miles built.
1867	2,449	1878	2,629
1868	2,979	1879	4,746
1869	4,615	1880	6,876
1870	6,070	1881	9,796
1871	7,379	1882	11,568
1872	5,878	1883	6,741
1873	4,097	1884	3,825
1874	2,117	1885	3,608
1875	1,711	1886	9,000
1876	2,712	1887	12,724
1877	2,280		

Kansas City has been especially favored in the matter of railroad construction. Two new lines from Chicago have built here, and another will be completed to this point this summer. In fact, the great railroad construction of the year has been in Western

States, and nearly all the new territory opened is tributary to this city. Kansas City, it may be said, has reaped more benefit from the railroads built in 1887 than any other city in the country. Fifteen great roads now center in this city, and before the close of the present year this number will be increased to nineteen or twenty.

RECEIPTS AND SHIPMENTS.

Comparative table of receipts of leading articles during 1886 *and* 1887, *as reported to the Board of Trade.*

GROWTH OF THE PORK-PACKING BUSINESS.

The following is a statement showing the number of hogs packed in Kansas City each year since the beginning:

Year.	Number packed.	Year.	Number packed.
1868–'69	13,000	1878	349,097
1869–'70	23,000	1879	366,830
1870–'71	36,000	1880	539,797
1871–'72	83,000	1881	856,823
1872–'73	180,000	1882	749,083
1873–'74	175,000	1883	1,056,116
1874–'75	70,300	1884	1,137,661
1875–'76	74,474	1885	1,554,100
1876–'77	114,869	1886	1,749,660
1877	180,357	1887	1,937,870

CATTLE AND SHEEP.

Number of cattle slaughtered in 1887	165,736
Number of cattle slaughtered in 1886	102,868
Number of cattle slaughtered in 1885	77,576
Number of sheep slaughtered in 1887	72,349
Number of sheep slaughtered in 1886	29,159
Number of sheep slaughtered in 1885	32,021

LIVE-STOCK RECEIPTS AND SHIPMENTS.

Receipts of hogs during the years 1884, 1885, 1886, *and* 1887.

1884	1,727,273
1885	2,361,325
1886	2,310,566
1887	2,527,627

Shipments of hogs during 1884, 1885, 1886, *and* 1887.

1884	595,916
1885	808,544
1886	840,002
1887	554,907

In this line business for the year 1887 has been exceedingly active. By comparing the total receipts of hogs at the Kansas City yards for 1887 with the total receipts for 1886 the increase for 1887 will be seen to be 217,061, or not quite 10 per cent.

Receipts of cattle during 1884, 1885, 1886, *and* 1887.

1884	534,892
1885	508,655
1886	505,998
1887	701,202

Shipment of cattle during 1884, 1885, 1886, *and* 1887.

1884	442,411
1885	422,391
1886	386,681
1887	514,591

For 1887 the cattle business of this city shows an immense increase over the business of 1886. The receipts for the twelve months ending December 31, 1887, were 701,202 and those for the corresponding period in 1886 were, as shown by the table, 505,998 The increase of 1887 over the total receipts of 1886 was 195,204, or 38.57 per cent. The shipments of 1887 show an increase of 127,950, or an increase of about 33⅓ per cent. In order to accommodate this immense influx of new business it has become necessary to greatly enlarge the capacity of the yards.

Improvements to the amount of about $150,000 have been added to the Kansas City stock-yards facilities here during the year. One of these was the addition to the Exchange building.

Sheep.

This department of the live-stock trade was, to use a common expression, "considerably run down" at the close of the year 1885. When one compares the receipts (9,746) for December, 1885, with 18,800, the receipts for December, 1887, he will perceive that a great expansion of the business has occurred. The total increase of the receipts of sheep for 1887 is nearly 26,000 more than the total receipts for 1886.

Receipts of horses and mules during 1884, 1885, 1886, *and* 1887.

1884	26,149
1885	24,335
1886	34,232
1887	30,315

Shipments of horses and mules during 1884, 1885, 1886, *and* 1887.

1884	14,639
1885	16,016
1886	26,983
1887	21,993

While the receipts of horses and mules for the past year show some decrease as compared with the year before, yet it seems to be pretty generally conceded by those best posted in the matter that the offerings here have been larger than last year. The reason for the apparent falling off is that a great deal of stuff which usually went through the stock-yards has, during the past year, been consigned directly to houses in various parts of the city for sale, and in that way did not figure in the receipts at the yards.

THE GRAIN TRADE.

Total grain receipts of Kansas City for a series of years.

Year.	Wheat.	Corn.	Oats.	Rye.	Barley.
1871	687,000	350,000	.....	.....	.....
1872	289,726	601,864	93,635	12,921	3,087
1873	750,400	836,300	105,200	10,500	12,380
1874	371,273	711,367	210,475	3,400	37,450
1875	1,256,337	1,258,700	382,850	40,000	15,100
1876	1,820,297	5,769,395	117,241	396,612	109,045
1877	2,259,572	5,881,703	180,657	329,887	203,341
1878	9,014,291	4,911,529	155,089	352,262	163,257
1879	6,417,952	4,121,904	276,775	184,046	92,591
1880	4,093,528	4,421,760	366,486	65,267	82,894
1881	4,102,649	3,282,851	533,410	79,267	200,875
1882	9,279,067	5,161,318	754,530	115,339	40,163
1883	9,023,472	12,036,493	658,779	292,884	36,318
1884	10,069,231	13,191,775	838,949	275,363	57,219
1885	4,763,844	7,894,584	831,867	278,677	68,487
1886	2,881,132	4,866,773	1,648,536	70,469	130,969
1887	932,860	3,813,377	2,295,217	38,309	279,100

The statement that the grain trade of Kansas City has been very light during the past year will surprise no one. Considering that the market here has always looked to Kansas for it supplies, it is a wonder that there has been any trade here at all, for, instead of being an exporter, the State has been a large importer. Under the circumstances, then, there is nothing discouraging in the figure Kansas City has cut in the trade during the year.

PART III.

COMMERCE OF THE MISSISSIPPI RIVER FROM MEMPHIS TO THE GULF OF MEXICO.

By Mr. NORMAN WALKER, *New Orleans, La.*

RIVER CRAFT.

Give the number and tonnage of each class of craft passing up and down the river separately and the number of repeated trips of the craft of every kind.

The river traffic of New Orleans is handled by a variety of boats, some propelled by steam, some towed or floating down stream, and some propelled by sail.

The steam craft include the steam-boats and the tugs engaged in towing the barges and other floating vessels, rafts, etc. The floating vessels comprise the barges, grain and coal, and boats, coal, stave, produce, etc., while sailing vessels engaged solely and exclusively in river traffic are the luggers, small boats of from 5 to 10 tons burden.

The Mississippi River steam-boat is peculiar to that stream and its tributaries, being the outgrowth of over seventy years of boat-building. Originally constructed of a somewhat marine character, and much like ocean vessels, changes and modifications have been made from time to time to suit the boats to their work, the object sought being to obtain a light vessel of small draught and of great carrying capacity and with high speed. Important changes were made, particularly in the earlier days of steam-boating, and a vessel finally obtained which gave complete satisfaction. In the past twenty years the changes in the build have been comparatively small, but of late a disposition has been shown to make the steam-boat more a freight-carrier than a passenger packet.

The smallest steam-boats have a carrying capacity of 5 tons, and the largest of 3,600 tons. These smaller boats are not used in the general trade, but are owned by planters and others, who use them in connection with their business. The bulk of the steam-boats employed on the Lower Mississippi River range from 500 to 1,000 tons net, by the United States measurement.

The steamers constructed of late have been mainly for the transportation of freight, as the passenger business has been seriously crippled by the railroads. Their construction also has been stronger, with a view of making them last longer. Decoration and fancy work, which gave a greater chance for fire, are giving away to utility and economy. The engines being now used in the boats are a great improvement on those formerly in vogue, effecting a saving of nearly 50 per cent. in the fuel. In the matter of propulsion, the boats in the New Orleans trade are about equally divided in number between stern-wheelers and side-wheelers, those propelled by wheels behind or on the side, all the large boats being of the latter class. (The cost of the boats ranges from $5,000 to $225,000, the average new steamer costing anywhere between $25,000 and $50,000. Railroad competition, which has diminished the business and profits of the river steamers, has of late depreciated their value.)

While not handling relatively or in the aggregate as large a proportion of the river commerce of New Orleans as formerly, the steam-boats continue to do a large share of it. They lead in the tonnage, both to and from the port; and the value of the goods and produce handled by them far exceeds that transported by the barges, boats, and other river craft, the latter being employed mainly for the transportation of bulky articles like grain, corn, cotton seed, etc.

The following were the steam-boats arriving in New Orleans by way of the Mississippi river or its tributaries during the year January 1 to December 31, 1886, not including such as were engaged in the business of hauling sailing vessels or injured steamers from the jetties, or in the ordinary tug business of the port. The list also gives the trades in which each vessel was engaged, the ports to which running, the streams navigated, and the number of trips made during the year:

The number of steam-vessels engaged in each trade, the trips made by them, and the tonnage employed, was as follows during 1886, the usual allowance of one-third being made for the carrying capacity of the boats over and above their registered tonnage:

Line of trade.	Boats engaged in trade.	Trips made.	Carrying capacity.
Mississippi River:			*Tons.*
Lower coast (from New Orleans to Port Eads)	6	426	66,399
Upper coast (from New Orleans to Baton Rouge and Bayou Sara)	10	546	327,387
Vicksburg and bends (from New Orleans to Greenville, Miss.)	5	116	145,756
Memphis and Helena	2	17	38,185
Saint Louis, including all steamers destined for Upper Mississippi, but prevented from ascending by ice or low water	14	127	194,216
Bayou Lafourche (from New Orleans to Bayou Lafourche, Thibodeaux, and Lockport)	4	221	51,667
Atchafalaya River and Bayou Teche (from New Orleans to Washington via Bayou Courtableau, and Saint Martinsville via Teche)	6	89	54,219
Ouachita River (from New Orleans via Red and Ouachita, including Bayous Tensas, Macon, D'Arbonne, and Bœuf)	9	72	37,168
Red River (from New Orleans to Shreveport)	11	176	74,705
Ohio River (including boats to Louisville, Cincinnati, Wheeling, and Pittsburgh)	34	121	113,201
Miscellaneous:			
White River, Arkansas	1	4	5,548
Saint Francis River, Arkansas	1	3	
Yazoo River, Mississippi	1	1	
Bayou Barataria, Louisiana	1	13	
Bayou des Allemands, Louisiana	1	15	
Arkansas front	1	7	
Total arriving during 1886	106	1,954	1,108,451
Total leaving during 1886	104	1,950	1,107,020

The number of boats in the several trades will sum up slightly higher than the total engaged, as several have run in more than one line.

The totals are lower than for previous years, the steam-boat business of the last eight years having been as follows:

Years.	Steamers.	Trips made.	Tonnage.	Years.	Steamers.	Trips made.	Tonnage.
1887	102	1,908	990,560	1883	128	2,335	1,313,292
1886	106	1,954	1,108,451	1882	133	2,413	1,378,946
1885	111	2,162	1,223,754	1881	149	2,562	1,492,912
1884	110	2,175	1,234,244	1880	168	2,658	1,675,360

The decline in the arrivals and tonnage of steam-boats has been constant for this entire period, due to railroad competition and other causes. The tonnage thus lost, however, has been, to a large extent, made up in other lines by the increase in the barge and floating vessels.

Next in importance to the steam-boats are the barges and boats, towed by the powerful tugs engaged in this business. The barge commerce of the river is, to a certain extent, of recent origin; for while coal has been brought down in this way from Pittsburgh for many years, it is only since the war that the model barges of the Saint Louis line, the Saint Louis and Mississippi Valley Transportation Company, have been in use and carrying freight of all kinds.

There are two varieties of barges on the Lower Mississippi, those employed in handling grain and general merchandise and those carrying coal; the first being confined almost exclusively to the Mississippi River proper, the latter to the Ohio.

The grain barges are built of the finest model, and of the best iron and wood. They range from 600 to 1,800 tons in burden, and cost from $10,000 to $12,000 each. Their carrying capacity is 60,000 bushels of wheat. The coal barges are much inferior in their make, costing only $1,200, and in capacity ranging from 3,750 to 9,500 barrels of coal.

Improvements in the construction of barges have been going on for some time, but they have now about reached their finish. The object sought is the greatest carrying capacity with the least resistance to the water and the lightest draught, as they are required for traffic on streams which are very low at some seasons of the year. The towboats used in towing these barges are powerful steamers. The *Henry Lowrey* of the Saint Louis and Mississippi Valley Transportation Company, towing from 4 to 6 barges, is 110 feet in length, beam 35 feet, hold 6 feet, stroke 26 inches diameter, towing capacity 15,000 tons, cost $75,000.

In the tow of the grain barges there are seldom more than 6 or 7 boats at a time; while the coal barge fleets will include 30 to 40, all towed by one tug, the latter really float down stream, the tug being employed mainly to keep them in line and to prevent them running aground or on shore. The grain barge tow is smaller in order to facilitate a quick trip. If the tow is large, it goes but little faster than the current of the river. Moreover, the tug doing the towing can with difficulty convey more than 6 of the barges up stream again. These barges do not carry grain alone, but all kinds of Western produce and merchandise, and in a single tow there are often from 18,000 to 35,000 different packages.

The Saint Louis barge lines to New Orleans have been for some time consolidated into a single company, the Saint Louis and Mississippi Valley Transportation Company, whose business for the year 1886 was as follows:

Barge traffic between New Orleans and Saint Louis during 1886.

Tow.	Down.	Up.	Tow.	Down.	Up.

Tows	41
Barges and boats	570
Tonnage of barges and boats, 1886	498,225
Tonnage of barges and boats, 1887	549,775

The other barges in the commerce of New Orleans are engaged in transporting ice from the upper river, cotton seed from the Mississippi, Arkansas, and Yazoo Rivers, and occasionally cotton, lumber, and other goods. The total number is small as compared with the grain and coal barges.

For the year 1886.	Barges.	Tonnage.
Saint Louis and Mississippi Valley Transportation Company	299	381,402
Coal barges and boats	570	498,225
Other barges and boats	118	109,120
Total	987	988,747

For the year 1887.	Barges.	Tonnage.
Saint Louis and Mississippi Valley Transportation Company	371	469,507
Coal barges and boats	619	549,775
Other barges and boats	109	103,550
Total	1,099	1,122,832

If the steam tonnage engaged in the transportation of these barges during 1886 be included it will give them a total tonnage of 1,058,968 engaged in the barge and towing business against 1,038,230 in the regular steam-boat business, showing the two to be very nearly equal.

The following table gives comparison with previous years.

Years.	Barges.	Tonnage.	Years.	Barges.	Tonnage.
1887	1,099	1,122,832	1883	876	855,325
1886	987	988,747	1882	857	833,862
1885	932	934,420	1881	838	830,912
1884	835	830,640	1880	857	849,420

The other boats reaching New Orleans by floating or towing are the produce or flat-boats mainly from the Ohio River, and steam-boats and luggers. These formerly constituted at one time an important element in the commerce of New Orleans, but are now of little moment. The produce boats come mainly from the Ohio River with cargoes consisting of potatoes, apples, and hay. There are a number of regular hay boats floated or towed down during high-water season, some of them landing at points along the river, at Vicksburg, Natchez, and Baton Rouge, but the majority going to New Orleans. The great bulk of the boats are sold there, but some few of the better class are towed up stream again.

The luggers are small vessels, generally with one mast (although sometimes with two), having quadrilateral or four-cornered fore-and-aft sails bent to the hoisting-yard. They are employed in the oyster, fish, and orange trade below New Orleans, or in the transportation of produce, rice, and sugar from plantations in the immediate vicinity of the city. They are confined to the lower portion of the Mississippi, seldom venturing higher than Baton Rouge, on account of the lack of wind.

The following gives the miscellaneous river traffic of New Orleans during 1887 and for the previous seven years, including all kinds of miscellaneous sailing or floating vessels, stave, produce, lumber, and flat-boats and luggers:

Years.	Flat, stave, and other boats.	Luggers in river traffic.	Tonnage.	Years.	Flat, stave, and other boats.	Luggers in river traffic.	Tonnage.
1887	272	1,707	97,960	1883	272	1,365	92,792
1886	240	1,693	87,642	1882	361	1,344	118,720
1885	300	1,587	102,226	1881	298	1,266	99,615
1884	303	1,490	102,974	1880	286	1,310	85,160

Total river tonnage arriving at New Orleans in 1886.

	Tons.
Steam-boats	1,108,451
Barges and boats (towed)	988,747
Flat, stave, and miscellaneous boats	87,642
Total	2,184,840

Total river tonnage arriving at New Orleans in 1887.

	Tons.
Steam-boats	990,560
Barges and boats (towed)	1,122,832
Flat, stave, and miscellaneous boats	97,960
Total	2,211,352

The comparison with previous years is as follows:

Tonnage of river vessels arriving at and leaving New Orleans.

Years.	Arriving.	Leaving.*	Years.	Arriving.	Leaving.*
	Tons.	*Tons.*		*Tons.*	*Tons.*
1887	2,211,352	1,390,538	1883	2,261,409	1,685,825
1886	2,184,840	1,458,256	1882	2,331,528	1,680,789
1885	2,260,400	1,520,400	1881	2,427,439	1,840,675
1884	2,167,858	1,554,720	1880	2,609,940	2,046,320

* Not including empty boats and barges being towed up stream.

During the past six years the river tonnage arriving at New Orleans has been somewhat constant, not showing much change. What has been lost in the steamers has been made good, to some extent, in other lines, principally by the barges arriving. There has been during this period a somewhat steady decrease in the tonnage of arrivals, the total loss amounting to 6.6 per cent.

FREIGHT TRANSPORTED ON RIVER.

Give, as far as practicable, the kinds of freight carried up and down the river separately, and the tonnage and value of each kind.

The statistics of the river traffic of New Orleans are very defective. The railroads publish each year the amount of their business, both the goods brought by them into the city and those exported. No such record, however, is kept of the steam-boats, but tables are prepared showing the receipts from week to week of produce, by river, rail and lake. The cotton statistics of New Orleans are complete, thorough, and reliable. Every bale is traced from its arrival here until it is shipped off by steamer or ship to the Eastern States or to Europe. Strange as it may seem, some of the steam-boat lines consult the reports of the New Orleans Cotton Exchange to find the amount of their own cotton business. In several other lines, particularly in grain, accurate statistics are preserved, but in most articles there are no statistics at all as to the river business, and the receipts by rail, river, and lake are given together.

Of the out-going traffic, the record is even more defective. The reports of the United States custom-house show the amount of goods shipped to foreign countries. There is no record of the business done with coastwise ports, save in a few articles. The railroads keep a record of their exports from New Orleans, but there are no statistics of the shipments by river from that city save the manifests or trip books of the out-going steamers and barges.

No efforts have yet been made to give these exports by river, as the Merchants' Exchange of Saint Louis and the Chamber of Commerce of Cincinnati have done in those cities. It is impossible, therefore, to get the records for previous years, and that of last year (1886) can be obtained only with great difficulty.

There are four routes by which produce or goods can reach New Orleans or be shipped from it—by ocean, lake, rail, or river.

What is regarded as the ocean commerce of New Orleans comes up the Mississippi from the jetties. It is true that vessels from the Gulf ports to the East, particularly from the lumber ports of Mississippi Sound, such as Biloxi and Pascagoula, and from Mobile and Pensacola, can enter New Orleans by way of Lake Pontchartrain and the two canals, Carondelet Canal and the new canal connecting the lake with the city, but the receipts coming in this way are included under the head of "lake" commerce. The larger vessels from these ports, as well as all vessels from Florida east of Pensacola, such as Tampa, Cedar Keys, etc., reach New Orleans by the jetties and figure under the arrivals from the ocean. The ocean commerce of the city includes all foreign vessels and all coastwise vessels, except those few which run from sea ports in the immediate vicinity by way of Lake Pontchartrain and the canals.

The lake trade is restricted to the small area of territory situated immediately on Lakes Pontchartrain and Borgne and the streams tributary to them, and on Mississippi Sound and the rivers entering it. This includes some three or four parishes in Louisiana and three counties in Mississippi. In it are engaged a few steam-boats of a semi-marine type and a large number of schooners, brigs, and luggers. The steamers run to Mandeville, Covington, and other towns on the opposite side of Lake Pontchartrain, to Pearl River, the dividing line between Louisiana and Mississippi, and across the lake and up the Amite River and Bayou Manchac. They bring some cotton and a small amount of sugar, rice, and other products to New Orleans, large quantities of oysters, shrimp, and fish, but the bulk of their trade is in heavy articles, namely, the produce of the forest, lumber, shingles, fire-wood, pitch, tar, and turpentine; besides, charcoal, sand, bricks, etc. The trade employs a large number of small vessels, but is inconsiderable in comparison with the other lines of traffic of the city.

The railroad traffic of New Orleans has grown within the last few years to be the most important branch of its trade. There are six trunk lines, and one local line running from New Orleans, as follows:

(1) Southern Pacific, from New Orleans to El Paso, with numerous branches and connections.

(2) Illinois Central (Chicago, Saint Louis, and New Orleans), from New Orleans to Chicago, with branches.

(3) Louisville and Nashville, from New Orleans to Mobile, and extending thence to all portions of the South and West.

(4) Texas and Pacific (New Orleans Pacific branch), extending from New Orleans to Shreveport, and thence, by the main stem, to Sierra Blanca and El Paso, and connecting at various points with the Missouri Pacific system, of which it is a part.

(5) The Mississippi Valley Railroad (Louisville, New Orleans, and Texas), extending to Memphis, and there connecting with the Chesapeake and Ohio system, of which it is the southern branch, extending to the Atlantic seaboard.

(6) New Orleans and Northeastern, to Meridian, a part of the Cincinnati, New Orleans and Texas Pacific system, extending to Chattanooga and Cincinnati.

These are the trunk lines to New Orleans. They are among the most important roads in the country, and are the main stems or branches of railroad systems having a total mileage of 107,232 miles.

The local line is the New Orleans and Lake Borgne Railroad, extending from New Orleans to Shell Beach, on the lake, and purposing to extend farther down the river to Pointe à la Hache.

The railroad lines have greatly extended their business during the last few years, partly at the expense of the steam-boats and partly by new and better connections. They do a large import and a considerable export trade, bringing produce from all the country they traverse to New Orleans, mainly for export by ocean vessel, but also largely for transshipment to other railroads, or to the steam-boats, barges, etc., running to river points in the interior.

The river business of New Orleans, which was formerly the most important branch of its trade, has shrunk somewhat during the last few years. It still continues, however, despite all competition to be one of the most important avenues of the city's commerce, and to be above all competition in certain lines, such as grain, coal, cotton-seed, etc.

There are several branches of the river trade, according to the business done and the points with which traffic is carried on. Each line requires special classes of boats as to size, draught, etc. The river business of New Orleans may be classed in the following divisions:

1. Lower coast.
2. Upper coast.
3. Vicksburg and bends.
4. Memphis.
5. Saint Louis.
6. Bayou Lafourche.
7. Bayou Barataria.
8. Bayou des Allemands.
9. Atchafalaya River.
10. Bayou Têche.
11. Red River.
12. Ouachita River.
13. Yazoo River.
14. White and Arkansas Rivers.
15. Ohio River.

1. THE LOWER COAST.

This trade includes all the business done on the river below New Orleans from the jetties up. It has been free from railroad competition until lately, and only to-day in the upper portion of the lower coast stretch, where it competes with the New Orleans and Lake Borgne Railroad. The boats have had therefore a virtual monopoly of this business, as the planters on the lower coast, which includes the parishes of Saint Bernard and Plaquemines, receive their supplies of all kinds from New Orleans. Two kinds of boats run in this trade, the regular packets of the Red River and Coast Line, and the luggers, the former, however, bringing up nearly all the produce and carrying back all the supplies. The trade is a good and profitable one and has always been such. The sugar and rice plantations and the orange groves below New Orleans are among the best cultivated and most productive in the country, and the small steamers running in this trade, of from 40 to 300 tons, make good loads every trip. They carry the mails, bring up all the products of the country, principally sugar, molasses, rice, and early vegetables, and take down all the supplies, groceries, and manufactured articles needed by the 18,000 people living along the banks of the Mississippi between New Orleans and the Gulf. Their down cargoes, therefore, are of the most miscellaneous character. Among the heaviest items are cotton-seed meal and other fertilizers, now extensively used by the sugar planters in cultivating cane, and lumber, in which the country is very deficient and for which it has to depend upon New Orleans. "The lower coast" consists of a narrow strip on both sides of the Mississippi. There are no roads running back, and the people being without a railroad or any other connection with New Orleans or any other point, are wholly dependent on the river. Hence the down tonnage of the steam-boats is as great as their up traffic, although not as valuable, consisting largely of bulkier and less valuable articles.

The announcement of the intention of the railroad to extend its line along the left bank of the river to Pointe à la Hache, thus bringing it into competition with the steam-boats for the greater portion of their present route, has brought about the withdrawal from the trade of the Red River and Coast Line, which formerly controlled it with its

steamers, the latter being transferred to the railroad company. The boats will in future, therefore, be run in connection with the railroad and as feeders for it.

The distance from New Orleans to Pointe à la Hache, the county seat of Plaquemines Parish, is only 46 miles, and vessels running there can make two trips a day. To Port Eads it is 107 miles, requiring a vessel, with the frequent stoppings that have to be made at all the plantations, a day to go and another to return.

THE UPPER COAST.

This name is generally used to designate the river country between Bayou Sara and New Orleans, including all the rice and sugar country along the Mississippi. There are ten steamers in this trade, making five hundred and forty-six trips a year. These steamers run to various points. Some go no higher than Hahnville, in Saint Charles Parish, 27 miles above New Orleans; others to Point Houmas, in Ascension Parish, 67 miles above; others to Donaldsonville, in Ascension Parish, 77 miles distant; others again to Plaquemine, 108 miles; Baton Rouge, 129 miles; and Bayou Sara, where the Upper Coast may be considered to end, 163 miles. This trade includes the largest tonnage of any branch of the steam river commerce of New Orleans, and has continued to do a fair business, notwithstanding a very vigorous competition that it has had with the railroads for there is competition all along the line. On the left or east bank of the river is the Mississippi Valley, or Louisville, New Orleans and Texas Railroad, running parallel to the river, through the rear of the sugar plantations; on the right or west bank, as high as Baton Rouge, is the Texas and Pacific (New Orleans Pacific), also parallel with the river, from a half mile to 5 miles back of it, and running through Donaldsonville, Plaquemine, and all the towns. There has been more or less competition in rates, and the freight charges have been uncertain and varying, the steam-boats seeking to meet the frequent cuts of the railroads. Only in that way have they been able to retain the bulk of their business. At Bayou Sara, where the West Feliciana Railway reaches the river from Woodville, the boats secure many bales of cotton brought from the interior by the railroad. This road is one of the few left of the many constructed years ago in the Lower Mississippi country tributary to the river, with no railroad connections, but bringing the produce of the interior country to the Mississippi at Vicksburg, Bayou Sara, and other points, to be thence shipped to New Orleans by boat. This source of supply to the steamers, and which made Bayou Sara their terminus, threatens to be soon cut off, as the railroad has been bought, it is asserted, by the Louisville, New Orleans and Texas road, which will build a branch from Centreville, on its main stem, to Woodville, connecting there with the West Feliciana line and making it tributary to the railroad instead of to the river, as formerly.

The Clinton and Port Hudson railroad, extending from Clinton, in East Feliciana Parish, to Port Hickey, on the river, was also tributary to the steam-boats until very recently, but has similarly been made a branch of the Louisville, New Orleans and Texas line.

This competition and these branches have affected the Upper Coast trade and carried off some of it. The boats have made a fight, however; have done remarkably well, considering the disadvantages under which they have labored, and have retained the greater portion of the traffic of this section. They offer the advantage of being able to land at any point, whereas the railroads have to locate fixed stations. The boats will land wherever and whenever they are wanted by a simple wave of a handerchief by day or a bonfire by night. In coming down stream during the grinding seasons they run from one side of the river to the other, making such frequent landings that they seem almost like ferries. Again, the front portions of the plantations are always the highest cultivated. The residences of the planters are always on the river front, and the sugar houses and "quarters" only a short distance back, so that the haul is generally less to the river than to the railroad. In the bends of the river, moreover, the boats enjoy another advantage. It would be folly, if not impossible, for the railroads running along the Lower Mississippi to follow its tortuous course. They are naturally as straight as possible, and while this gives them the advantage of a shorter route it takes them so far from the plantations on the bends that the latter are of necessity compelled to ship their produce and receive their supplies by boat. Again, in the matter of sugar and molasses, which are the most important productions of "the Upper Coast," the steam-boats enjoy the further advantage of landing directly in front of the sugar sheds, which are the sugar warehouses of New Orleans, where the Sugar Exchange is situated and all the sugar business of the city is done. This is a great advantage over the two competing railroads, neither of which has a line running near these sheds. The sugar carried by them to New Orleans has, therefore, a long haul to make from their depots. These have been the main causes which have conspired to retain for the Upper Coast packets the bulk of this trade.

During the year 1886 there were two principal lines engaged in this trade, the Red River and Coast Line and the Coast Packet Line, besides a number of independent boats. The business of 1886 shows a slight falling off from previous years on account of somewhat smaller crops. The boats got as large a share of the business as usual, but generally at less profit. The business was carried on most profitably by quick and short trips. Stoppages were very short, the boat leaving as soon as the cargo was off and the goods to be shipped up stream on board. Some of the smaller boats running in the immediate vicinity of New Orleans made a trip nearly every day, keeping the roustabouts on them busy night and day loading or unloading. These boats in this trade are from 100 to 400 tons; the larger ones, running to Bayou Sara, of 800 and 1,100 tons.

The shipments down stream consisted of the produce of the country, cotton, sugar, molasses, rice, and some few manufactured products, namely, rough, heavy articles like lumber, brick, etc., from Plaquemine, Baton Rouge, and the other towns. The shipments up stream were of the same miscellaneous character as is all the river export commerce of New Orleans, including supplies of all kinds, provisions, clothing, boots and shoes, and manufactured goods. The Saint Louis and Ohio River boats supply a portion of the Western produce, pork, corn, etc, needed in this section, and the railroads handled a larger proportion of the manufactured goods, clothing, etc., shipped up from New Orleans than they did of the down shipments of produce.

3. VICKSBURG AND THE BENDS.

The section of the river between Bayou Sara and Greenville is generally known as "The Bends," because of the frequent turns and windings the Mississippi makes here. This is the richest and most productive cotton country of the world. The center of maximum cotton production of the United States is at the point where the State lines of Mississippi, Louisiana, and Arkansas meet the Mississippi River. Here are the three counties of Washington (Mississippi), Chicot (Arkansas), and East Carroll (Louisiana), each of which showed, in the census, the largest production of cotton in its respective State. The staple product of this region is cotton. Some corn is grown for home use, but cotton has the largest average, and its growth and handling constitutes the principal occupation of the population, in which the negro element largely preponderates, in some places being more than 10 to 1 white. The traffic of this section consists almost wholly of the shipment of cotton and cotton-seed to market and the receipt of plantation supplies.

Few lines of river traffic have suffered more than this during the last few years, and its glories are rapidly passing away. In the older days this was the largest and most profitable river trade of New Orleans, and from this region 400,000 to 500,000 bales of cotton were shipped by river to the city, and the supplies necessary to raise them sent back, yielding a trade of from $30,000,000 to $40,000,000 annually. Lines of steamers were then run to Fort Adams, Natchez, Grand Gulf, Vicksburg, and Greenville, each of these points being the terminus of one or more packet lines. For some years past there has been a decline in the shipments of cotton from this section by river to New Orleans, and a large decline in the return receipts of supplies. This has been due to several circumstances. The Cincinnati steamers now carry a considerable quantity of cotton North, whereas all of it formerly went South; more goes to Memphis, which has several lines running down the river to points below it, and some even to Saint Louis. But the greatest diversion has been on account of the construction of the Louisville, New Orleans and Texas Railroad, parallel to the river, touching it either with the main stem or in branches or connections at various points, notably at the larger towns like Natchez, Vicksburg, and Greenville. These, which formerly depended mainly on their river business, have latterly become railroad cities. The building of this railroad has transferred a large portion, a majority, indeed, of the cotton trade away from the river to it. The rates on cotton are made very low at river points, leaving little if any margin of profit on the transportation of this product. The Yazoo cotton which comes to Vicksburg and was there formerly transshipped to boats, now goes to New Orleans or North largely by rail. At Delta, opposite, the cotton reaching the Mississippi by way of the Vicksburg, Shreveport and Pacific Railroad from Shreveport also reaches market mainly by rail. At Arkansas City, formerly a very large shipper of cotton by river, the staple is now ferried across the Mississippi to Huntington, where connection is made with a branch of the Louisville, New Orleans and Texas Railroad, and the cotton is carried by that route to New Orleans. The steam-boats have still control of the cotton at Fort Adams and other points on the east side of the river, where there are no railroads, the greater portion of the cotton from the plantations on the west bank, with some from the Yazoo and Sunflower Rivers, and some at Greenville, Vicksburg, and Natchez, where they compete with the railroad. The latter shipments are, however, decreasing, the railroads underbidding the boats at these points.

In the up trade of this section there has been a corresponding decline. This is due to the fact that the Saint Louis and Ohio boats furnish on their down trips a large proportion of the Western produce and supplies needed, while the railroad does a considerable share of the business from New Orleans in coffee, sugar, and imported goods.

The net result of all this has been that the river trade between New Orleans and Vicksburg and the Bends has shown a steady and rapid decline for some years past. The business was especially bad for 1886, employing but five boats. The two larger boats engaged in this trade, the *Ed. Richardson*, 2,048 tons, and the *J. M. White*, 2,027, found so little profit in it that they ran only a small portion of the year, being withdrawn early in the season and smaller boats, the *Natchez*, *Pargaud*, and *Leathers*, substituted.

4. MEMPHIS.

The Memphis and Helena trade has suffered even more severely than that of Vicksburg, and from the same causes. During 1886 and 1887 the railroad rates from Memphis have favored the shipment of cotton overland from that town eastward. As a consequence, the shipments to New Orleans have materially decreased as compared with previous years, and have been made mainly by the two railroad lines connecting New Orleans and Memphis, the Louisville, New Orleans and Texas, direct to "the Crescent City," and the Illinois Central, through its branch, the Mississippi and Tennessee, connecting with the main stem at Grenada. Some cotton was picked up by the boats at Helena, but less than formerly, as a larger share of the staple now goes north from that town to Memphis and Cincinnati. At Memphis large quantities of cotton-seed oil were shipped south to New Orleans for export to Europe, and some cotton-seed cake and meal. From the Mississippi River, as well as from the White and Arkansas, some cotton-seed and oak staves were obtained. The up cargoes were small, consisting of sugar, molasses, rice, coffee, and other imported goods. The trade which formerly sent down the largest cargo ever received in New Orleans, nearly 9,000 bales of cotton, on the *Chouteau's* famous trip, supported only two steamers in 1886, which made but seventeen trips.

The year 1887 has begun with a total collapse of this trade, no boats whatever being run in it, and the total shipments from Memphis amounting to a few dozen bales.

5. SAINT LOUIS.

The trade between Saint Louis and New Orleans has been good during the year 1886, in contrast with the other steam-boat lines. The bulk of this trade is handled by two companies, the Saint Louis and New Orleans Anchor Line of steam-boats and the Saint Louis and Mississippi Valley Barge Line.

The former had five regular steamers running in the New Orleans trade in 1886. One trip was also made by the *Will. S. Hays*, of the Saint Louis and Vicksburg Anchor Line.

The Saint Louis and Mississippi Valley Transportation Company has the following powerful tow-boats running to New Orleans: *Jay Gould*, *R. S. Hayes*, *Henry Lowrey*, *Future City*, *Port Eads*, *John Gilmore*, and *Oakland*, and 90 model barges, of a combined tonnage of 118,000 tons, capable of moving monthly to New Orleans 2,500,000 bushels of grain, or 90,000 tons of miscellaneous freight. There were during the year 61 tows of 299 barges.

A few independent Saint Louis boats made trips to New Orleans during the year; among them the *D. C. Fogel*, *D. R. Powell*, and *M. M. Michael*.

The business done during 1886 was good. The shipments South of grain in bulk, particularly wheat, showed a large increase over previous years. The barges went down heavily loaded with from 1,150 to 1,250 tons, and the up cargoes were much larger than previous years, including all kinds of goods, and averaging 325 tons per barge, or 94,125 tons for the line. A large proportion of this was of imported articles shipped in bond to Saint Louis. There was a large increase both by the barge line and the Anchor boats in the transportation up the river of goods brought by ocean vessels from New York and thence shipped by river to Saint Louis, as being cheaper than the route across the country by rail.

6. BAYOU LAFOURCHE.

Bayou Lafourche, "the fork" or branch, is the only tributary of the Mississippi below Red River that has been left open. It is an outlet from the river, one of its mouths emptying into Timbalier Bay. The Bayou connects with the Mississippi at Donaldsonville, 77 miles above New Orleans. It runs through one of the richest and most productive portions of Louisiana and is fringed on both sides by large sugar plantations, rice farms, orange groves, etc. The bayou is 300 feet wide and in high water from 25 to 50 feet deep. Like the Mississippi it is higher than the surrounding country, and the land has to be protected from overflow by levees.

The Southern Pacifice Railroad crosses the Lafourche at Lafourche Crossing, and the Texas and Pacific at Donaldsonville. A branch of the former road also runs to Thibodeaux, on this stream; but for the greater portion of the bayou the planters are dependent on the steam-boats to carry their products to market and to bring them their supplies. As the railroad rates are generally higher than those by water the steamers engaged in this traffic get the bulk of the business when the water is high enough in the bayou to enable them to run; but for a portion of the year it is too shallow for navigation, leaving the planters wholly to the railroads.

The boats employed in this trade are, in consequence of the narrowness of the bayou, necessarily small in size, of from 150 to 300 tons. They run generally as far down as Lockport, distant from New Orleans 150 miles by water. Below that point the country is but thinly populated.

The traffic on Bayou Lafourche is of much the same character as that of the river coast. The shipments to New Orleans, including sugar, molasses, rice, with some vegetables, eggs, chickens, etc., raised in the *brulées*, or small settlements back from the bayou. The return cargoes are plantation supplies of all kinds and manufactured goods. The boats during 1886 about maintained their proportion of the business, but the total was lower than for previous years on account of the shortness of the sugar crop.

7. BAYOU BARATARIA.

The Bayou Barataria trade is small and insignificant, employing only one small steamer. Bayou Barataria is a small stream extending from Lake Salvador, a few miles west of the Mississippi, to Barataria Bay. A canal has been cut from the Mississippi to the bayou, some 20 miles below New Orleans. Vessels, therefore, running from New Orleans to Grande Isle, Chénière Caminada, or Fort Livingston, on Barataria Bay, run down the Mississippi 20 miles, cut through this canal, and thence proceeed down the bayou to the Gulf. The country along the bayou is low, swampy, and generally uninhabited. At its upper end some sugar and rice is produced. At its mouth lie some of the best oyster beds on the Gulf coast, and a considerable traffic is kept up, mainly in luggers or small sailing vessels between these points and New Orleans. The shipments up stream consist mainly of oysters, generally in the shell, but some canned, shrimps, fish, etc.; the return shipments, which are generally small, consist of various supplies. There is but one small steamer making trips to Grande Isle, mainly for the carriage of passengers. The luggers do most of the freight transportation.

8. BAYOU DES ALLEMANDS.

The bayou is a small one on the west side of the Mississippi, immediately opposite New Orleans, connecting with the river by means of a canal. One small steamer is engaged in traffic on it bringing to New Orleans the small amount of sugar, molasses, and rice produced upon its banks.

9. THE ATCHAFALAYA RIVER.

The Atchafalaya River, which was the old bed of the Red River when it ran down to the Gulf instead of pouring into the Mississippi, as it does to-day, meets the Red and Mississippi on Old River (the old bed of the Red). The Atchafalaya, formerly an insignificant stream, has of late years grown in size and is now a deep, wide, and powerful river. It runs nearly parallel to the Mississippi, but in a straighter line direct to the Gulf, and being a shorter route, a great deal of the water of the Mississippi is diverted into it during high water. Towards the Gulf it breaks into a number of streams, and is known by several names, Grand River being the principal branch. It is difficult to tell which is the main stream, as in many places the country is cut up by branches and tributaries running into each other. By way of the Atchafalaya steamers are given access to Bayou Teche, Courtableau, Bœuf, and other streams of central and southern Louisiana. Up to 1865 communication existed with New Orleans via Bayou Plaquemines, which runs from the Atchafalaya to the Mississippi at Plaquemine. This stream, however, is now dammed up and vessels have to make the long and circuitous route via Red River.

The Atchafalaya boats now run from New Orleans to Old or Red River, thence to its junction with the Atchafalaya; thence down the Atchafalaya to Bayou Courtableau and up that stream to Washington, which is the shipping port for a rich and productive section of Saint Landry. The boats pick up a considerable traffic along the Upper Atchafalaya, which is leveed, and on the Courtableau. The products of the country consist of sugar, molasses, and cotton, but large quantities of eggs, chickens, wood, and some

wool, hides, etc., are shipped to the city. This traffic is seriously interfered with at two points by bars, at which the Government, both State and National, has been at work for half a century. The bar in Old River, by which access is obtained to and from the Mississippi, has been in a chronic state of closure since 1833. The State worked on it for thirty years, and the United States has been fixing it up ever since without securing any permanent good results, and the bar prevents vessels from entering the Atchafalaya a large portion of the year, and particularly that portion when the crops are being marketed. It is proposed to overcome this difficulty by the reopening of Bayou Plaquemines and the construction of a lock there; that will give an easy access to the Atchafalaya and do away with the present long, circuitous, and more or less dangerous trip up the Mississippi and thence through Old River and the Atchafalaya. At the mouth of Bayou Courtableau is Little Durt Bar, on which the State worked for years, and which the steamboat men have, from time to time, temporarily removed by their personal efforts.

The Texas and Pacific Railroad crosses the Atchafalaya at Melville, but does not enter there into much competition with the Atchafalaya boats. The Opelousas branch of the Southern Pacific, running into the country formerly tributary to the Courtableau and Atchafalaya, has diverted some of their trade. The business of 1886 showed a slight decline as compared with previous years, but was fair.

10. BAYOU TECHE.

Bayou Teche empties into Berwick's Bay, which is nothing but the mouth of the Atchafalaya. This gives it a long and circuitous water route to New Orleans, via the Teche to Morgan City, thence up the Atchafalaya to Red River, thence to the Mississippi, and down that stream to New Orleans. The country along Bayou Teche is in a high state of cultivation, the lower portion in sugar, the upper in cotton. This section of the State is known as "the sugar-bowl of Louisiana." The production and trade of the Teche parishes are large, but the steamers engaged in their trade get but a small share. The Southern Pacific Railroad runs parallel with the Teche through a large portion of its course, and branches extend north to Saint Martinsville and Opelousas. Boats, moreover, run in the Teche in co-operation with the railroad, acting as feeders to it. The lower portion of the Teche is navigable at all seasons of the year, if vessels can enter it by way of Old River. Improvements are now under way to open the Upper Teche also to steam-boats.

The Teche River business of 1886 was affected by the short sugar crop, and also, to a certain extent, by the railroad competition.

11. RED RIVER.

The traffic on Red River has fallen off for some years past. The construction of the Texas and Pacific Railroad, running nearly parallel with the river, and touching it at Alexandria, Shreveport, and other points, has diverted a large quantity of cotton. The steamers have been severely affected by the bar at the mouth of the river, and also by the low water in the Red a considerable portion of the year, rendering it impossible for vessels to ascend to Shreveport. At the competing points, the railroad claims to do 40 per cent. of the business. At Shreveport it gets the bulk of the cotton shipped to New Orleans. The boats do the business of the river towns and plantations having no railroad connections.

In 1886 one regular packet line, the Red River and Coast line, ran steamers on Red River. There were, in addition, several independent vessels. The business averaged well with previous years, in which the steam-boats had been in competition with the railroad. Some small amount of cotton was carried up stream to Shreveport. Even when the mouth of the river was closed to the steam-boats they continued running, the cotton, etc., being carried across the bar on small boats or transported from the Red and Atchafalaya by rail.

The *D. R. Powell*, from Saint Louis, did some business in the Red River and Ouachita trade during the year, principally in bringing supplies and Western produce from Saint Louis, but taking back no cotton or other products.

12. OUACHITA RIVER.

The Ouachita or Black River pours into Red River a short distance above its mouth. There is, therefore, the same difficulty encountered in entering it when the water is low in Old River. The Ouachita is navigable up into Arkansas. Camden, in that State, being the usual head of navigation. It has numerous tributaries, navigable for the smaller-sized boats, extending both south and west, some of them running to within a

few miles of the Mississippi River. These tributaries, Bayous Maçon, Tensas, D'Arbonne, and Bartholomew and Bœuf River, make the Ouachita the water outlet for the produce of a large section of country in Northeastern Louisiana and Southeastern Arkansas, including the parishes of Union, Morehouse, Ouachita, Richland, Caldwell, Franklin, Catahoula, Tensas, Madison, Concordia, and West Carroll in Louisiana, and Ouachita, Calhoun, Bradley, Ashley, and Union in Arkansas. The steamers engaged in the Ouachita trade are good-sized boats of 300 to 500 tons. Connecting with them are smaller steamers running on the tributary bayous and rivers. Boats also run direct from New Orleans to Bayous Maçon and Tensas, but the excessive insurance rate has operated unfavorably, and had a tendency to drive business away.

These railroads tap this region. The Vicksburg, Shreveport and Pacific crosses it diagonally from west to east, crossing the Ouachita at Monroe, as well as the Maçon and Tensas. The railroad does a large business, carrying the cotton and other produce to Delta, where the bulk of it is ferried across the river to Vicksburg, and thence shipped mainly by rail to New Orleans. Camden, Ark., which lies at the head of navigation on the Ouachita, formerly shipped a large quantity of cotton, pretty near all the product of the Upper Ouachita Valley, by steamer to New Orleans. The completion of a branch of the Saint Louis and Iron Mountain Road, from Gurdon to Camden, as well as the Texas and Saint Louis Railroad, has diverted some of this cotton and carried it northward to Saint Louis.

A small railroad, the Natchez and Texas, extending from Vidalia on the Mississippi, to Bayou Tensas, diverts a small amount of the trade of that section to Natchez, and thence by rail or river to New Orleans.

Despite this railroad competition, however, the Ouachita boats have done, and continue to do, a large business, and have lost relatively less of the cotton trade of their section than most of the other river lines. The chief competing railroad, the Vicksburg, Shreveport and Pacific, crosses the Ouachita instead of running parallel to it. The boats therefore have the advantage at all the river points, save at Monroe, where there is equal competition; and their rates have been such as to keep them this business. The trade suffers most from the closing of Old River, which requires an expensive transfer, the freight being brought down the Ouachita and Red and floated over the bar to other steamers on the Mississippi. It has occasionally been necessary for the boats to transfer a portion of their business to the railroad on account of low water, and on such occasions the comparison between the railroad and steam-boat rates have been especially striking. Some of these charges were made part of the brief of the steam-boat people in their argument before the Interstate Railroad Commission against the suspension of the fourth clause, in order to show the difference between the railroad rates when there was steam-boat competition and when the roads had absolute and undisputed control of the trade.

13. THE YAZOO RIVER.

The Yazoo trade of New Orleans is virtually a thing of the past, although most of the Yazoo cotton is still shipped to this city. Formerly steamers ran direct from New Orleans up the Yazoo, Sunflower, and other tributary streams. This business has been extinct for some time. The cotton from the Yazoo Delta—one of the most productive cotton sections of the country—is now brought direct by rail to New Orleans over the Louisville, New Orleans and Texas Railroad, or by the Parisot and Mulholland steamers to Vicksburg, where it is reshipped by rail or river.

The only traffic direct between the Yazoo and New Orleans is in cotton-seed, barges being loaded with the seed in the river and towed down to the city by tugs.

14. THE ARKANSAS AND WHITE RIVERS.

The Arkansas River trade of New Orleans has been rapidly disappearing and is well nigh extinct. During the year 1886 no boat ran from New Orleans up the Arkansas River, where formerly a large fleet had been employed, and only one boat ran in the White River, making very few trips.

A portion of the cotton grown on these rivers, however, was brought by boats to the Mississippi and transshipped there to steamers running to New Orleans instead of coming here direct. The bulk of the cotton, however, took other routes, some going by steamboat to Memphis; some by the Arkansas Valley route (Little Rock, Mississippi River and Texas Railroad), touching the Arkansas at Little Rock, Pine Bluff, and other points, and being brought to Arkansas City and thence transferred to the Louisville, New Orleans and Texas Railroad, and some going by the Saint Louis and Iron Mountain Railroad to Saint Louis.

In consequence of the rapid decline of this trade the Arkansas River, which used to figure conspicuously in the sources of receipts of cotton at New Orleans, has been dropped permanently from the table of the New Orleans Cotton Exchange.

14. SAINT FRANCIS RIVER.

What is true of the Arkansas and White Rivers is equally true of the Saint Francis. Some cotton is brought over it to Helena and transshipped there to New Orleans, but none comes direct. The only trade between it and the Crescent City is in logs and staves. Logs are towed out of the splendid forests of the Saint Francis basin and brought down in rafts to New Orleans and the other lower river towns, furnishing a large share of the timber other than cypress and pine used in the river saw-mills.

15. OHIO RIVER.

The Ohio River trade of New Orleans consists wholly of the trade with Cincinnati in Western produce, hay, flour, whisky, pork, apples, and potatoes, iron, nails, etc., from Pittsburgh, transhipped at Cincinnati; a small flat-boat trade in produce principally with points in Kentucky, and the coal trade with Pittsburgh, which in the number of vessels employed and in tonnage is far more than all the others combined. The lines of boats which formerly ran from New Orleans up the Cumberland and Tennessee Rivers have long since disappeared. There have been no regular Louisville boats for some time past. The only regular steam-boat line between New Orleans and the Ohio River is the Cincinnati Southern Transportation Line. With fewer boats in the trade than in previous years, this company did a better business, making more trips and handling more goods. The trade both down and up showed a gratifying increase, particularly in the transportation of cotton up stream. Most of this business came from points far above New Orleans, from Greenville, Helena, and Memphis.

The flat and produce boat trade, which was once the most important item of river business at New Orleans, has been small for thirty years, showing little variation. The business done in 1886 was slightly below the average. There were several tows to New Orleans, the boats being loaded principally with hay, potatoes, apples, and onions. The cost of this transportation is insignificant.

The coal trade of 1886 was larger than it was ever before; indeed, for some years past it has shown a steady and rapid increase. The use of coal for fuel in the sugar houses instead of wood, which is becoming scarce in the sugar districts, has yearly increased the demand and consumption of Pittsburgh coal in Louisiana. The coal is now delivered direct to the planter at a lower rate than the railroads can ever hope to make. The traffic is assured to the river at all times. Nine-tenths of the sugar plantations in Louisiana front directly on some navigable stream, and the coal boats can therefore be landed immediately on the river front on the Mississippi, Lafourche, or other bayou. Large quantities of coal are thus dropped by the descending tow-boats, not only at the towns like Vicksburg, Natchez, Baton Rouge, and other points, but in front of a large proportion of the 1,200 sugar plantations of Louisiana.

The coal consumption of New Orleans has been increasing on account of the increase of population, but largely on account of the new manufacturing industries established. Some competition has existed between Alabama and Pittsburgh coal, and quantities of the former have been brought in on the railroad, despite which the consumption of the Pennsylvania coal shows a large increase over all previous years, both in New Orleans and throughout Louisiana.

The competition between the steam-boats and the railroad lines from Louisville and Cincinnati and New Orleans, the Louisville and Nashville, and the Cincinnati, New Orleans and Texas or Cincinnati Southern, has been marked and vigorous throughout 1886. This competition was brought to the attention of the Interstate Railroad Commission, by the Louisville and Nashville Railroad, which demanded a release from the fourth clause of the interstate-commerce law, for the special purpose of competing with the Ohio River boats. The long and vigorous contest *ex rel.* this railroad, to investigate which the commission visited the South and sat in Atlanta, New Orleans, Memphis, and other points, turned principally upon the competition between rail and river for the Ohio valley trade.

These are the chief lines of river traffic in which New Orleans is engaged to-day. There are some smaller tributary lines in which it is also interested. Thus small steamers run in the bayous tributary to the Ouachita, and bring out produce to the Ouachita boats; the same is true of the Teche, Yazoo, and Sunflower, and some other streams.

The river steamers reaching New Orleans make out manifests of the principal articles brought by them, such as cotton, sugar, rice, etc., from which reports are made up by the Cotton and Produce Exchanges. The smaller articles, however, are not given, and no record is kept of the outgoing goods, produce, manufactured articles, etc.

The following tables give the receipts of produce and other goods in New Orleans during the year, January 1 to December 31, 1886, for each river line, and the total for the whole river. It includes receipts by steam-boats, steam-vessels of all kinds, barges,

flat, produce, and steam boats, river lugger, and, indeed, all the multifarious variety of craft navigating the Mississippi.

The receipts can of course only be given by the various lines of trade. It will thus be seen that the Cincinnati boats bring cotton to New Orleans, and the Saint Louis boats cotton, sugar, and rice. This is picked at points along the Lower Mississippi, but at what points it is difficult always to determine. It may be said, however, that the cotton brought by the Saint Louis and Ohio River boats was picked up between Bayou Sara and Memphis, generally between Bayou Sara and Greenville, in the section of the river known as the Bends; and the sugar, molasses, and rice on the upper boats, Saint Louis, Ohio River, Bends, Red River, and Ouachita, all come without exception from the country known as the upper coast between New Orleans and Bayou Sara. All the other freight on all the other lines was picked up by the boats in their legitimate territory.

Receipts of produce and other goods at New Orleans during the year (January 1 to December 31) 1886, by each river line.

* Shipped from points between New Orleans and Memphis on Mississippi River.

The total receipts of produce and goods at New Orleans in 1886, given below, includes some articles not given in the receipts by the several river routes, for the reason that it can not be determined exactly what points they came from; indeed, they were picked up along the river, and can not be properly classed as coming from any particular section.

Principal receipts by river at New Orleans.

The following gives the business in values of each line of trade. The exact source from which certain articles come to New Orleans by river, particularly the oysters and fish from below, and the staves and lumber from above is not given. These articles are therefore included under the head of "miscellaneous and otherwise accounted for."

On Mississippi River:	
Lower coast—Port Eads to New Orleans	$1,747,842
Upper coast—Bayou Sara to New Orleans	10,574,796
Vicksburg and Bends—Greenville, Miss., to New Orleans	9,408,007
Memphis and Helena—Memphis to New Orleans	2,944,959
Saint Louis—Saint Louis to New Orleans	19,099,226
Tributaries of the Mississippi:	
Bayou Lafourche	1,006,220
Atchafalaya River and Bayou Courtableau—Washington to New Orleans	1,222,615
Bayou Teche—Saint Martinsville to New Orleans	612,640
Red River—Shreveport to New Orleans	3,506,377
Ouachita River—Camden to New Orleans.	4,379,620
Ohio River—Pittsburgh to New Orleans	6,865,496
Miscellaneous (from St. Francis, White, Yazoo, and other rivers, and not otherwise fully enumerated elsewhere)	1,348,983
Total	62,716,781

The heaviest tonnage was in coal and grain, these two articles indeed, transported almost exclusively in barges, constituting half the total. The following table gives the tons of each class of articles received in New Orleans and their value.

The breadstuffs and grain include the wheat, corn, oats, barley, flour, corn-meal, grits, etc.

The cotton includes cotton-seed, cotton seed oil, cake, and meal, pickings, linters, etc.

The esculents include the apples, oranges, potatoes, onions, cabbages, and articles of food other than provisions.

The manufactures include furniture, iron and steel, hardware, stoves, kettles, bagging, domestics, glass and glassware, rope, manufactured tobacco, white lead, wire, woodenware, and a large number of general and miscellaneous manufactured articles.

The provisions are pork, bacon, ham, beef, lard, etc.

Rice includes also rice-bran and polish.

Under the head of miscellaneous are the other products, raw or in a semi-manufactured state, broom straw, cement, coffee, cider, clay, glue, grease, hair, hides, lead, lime, whisky, wine, vinegar, leaf-tobacco, moss, coal oil, plaster, resin, skins, and a large number of others.

Freight received at New Orleans by river and per cent. of weight and value of total receipts.

There are no records whatever of the shipments made away from New Orleans by river. The only thing to go by are the trip-books of the steamers and barge line, and as some of these have been lost or destroyed, it is impossible to obtain full and complete accounts of the exports from the city by river. They include a far greater variety of goods, provisions of all kinds, manufactured articles, etc., than are imported by this route. The heaviest shipments down stream from New Orleans are lumber and fertilizers, particularly the cotton-seed products. The lower parishes of Louisiana produce very little timber of any kind, and the sugar planters have latterly taken to using fertilizers in the cultivation of cane. The shipments include also all kinds of plantation supplies, articles of food, wearing apparel, etc. To this section even the bricks for the construction of houses are sent.

The shipments made to the upper coast, Lafourche, Atchafalaya, Red, Ouachita, are of the same character. They include the western produce, pork, flour, apples, oats, etc., brought down to New Orleans by the western boats, as well as the imported goods—cotton from New York or Europe.

The shipments by the Memphis, Cincinnati, and Saint Louis boats embrace the products of the South—cotton, sugar, molasses, and rice, and large quantities of imported goods. In the latter direction there has been a great increase in the last few years, particularly by the Saint Louis boats and barges. Heavy shipments are made up-stream of goods in bond. A single cargo to Saint Louis lately included 1,300 cases and 300 bales of dry goods, and 500 rolls of carpet.

The statistics of the exports by river from New Orleans are defective, and estimates have to be made for several lines of trade. The following table, therefore, is not as thorough or as perfect as that of the receipts of produce at New Orleans, as it is partly estimated:

The exports by river from New Orleans will sum up to about $35,875,000.

RAFTED DOWN THE RIVER.

Give the freight floated down the river by rafts and in other ways than in permanent boats or vessels.

It is difficult, if not impossible, to distinguish the freight brought down to New Orleans in boats of a permanent and non-permanent character; and for that reason all of the receipts by boats and barges are given in reply to the previous query. The reason is that sometimes the boats are sold and broken up in New Orleans, either for lumber or for fuel, generally for the latter, and again if they reach the city in fairly good condition, and are deemed capable of making other trips, they are towed up stream again. This is the case with all classes of boats of a not strictly permanent character, whether employed in the coal, stave, produce, or other trade. For this reason, and because it is impossible to determine which of them are of a permanent character and which are not, which are destroyed and which used again, no distinction being made or given on this point, these boats, with their cargoes, are included under another head. They consist of coal boats, employed in carrying coal and coke, and sometimes wood; stave boats, handling staves and wood, and produce boats, carrying produce of all kinds, but particularly potatoes, apples, onions, and cabbages.

The amount floated down the Mississippi on rafts, both lumber and cord-wood, is still large, although less than in former years. The saw-mills at Baton Rouge, New Orleans, and other river towns get the bulk of their material, logs, etc., from the river. In New Orleans there are two sources of supply, from Lake Pontchartrain, which is in the heart of the yellow-pine region of Louisiana and the Mississippi, by which most of the cypress, poplar, cottonwood, etc., arrives. The pine from the lake country reaches New Orleans by way of Canal Carondelet and the new canal, and is sawed into lumber or planed by the mills situated on these canals in the rear of the city. On the river front are seven saw-mills dependent upon the Mississippi for their supply of timber. The latter comes from all along the Mississippi. The bulk of it comes out of the Ouachita and Red River, about 56 per cent.; and about 20 per cent. out of the St. Francis River; the remainder mainly from the Mississippi itself. The cypress, which is the principal lumber employed

by the New Orleans mills, comes from the Ouachita, Black, Maçon, and other tributaries. So also does most of the ash floated down in rafts to New Orleans and cut there into cord-wood. The St. Francis furnishes poplar, cottonwood, walnut, and miscellaneous timber of all kinds. The bulk of the cottonwood and poplar, however, comes from the river front of Mississippi—the Yazoo country.

Formerly nearly all these rafts were floated down by raftsmen, who brought them to New Orleans and sold them there. A large number are so brought to-day, seventy-five rafts, mainly of ash, coming from the Ouachita and Black Rivers in 1886. Of late, however, a much larger proportion of the logs have been towed down by tugs. In 1886 about 40 per cent. of the timber reaching New Orleans came in this way. It can not be said, however, to have proved a great success. One steamer leaving the Saint Francis River with 1,000,000 feet of lumber got to New Orleans with only 250,000 feet, having lost three-fourths of her tow en route.

Some walnut and oak rafts are floated down to New Orleans, and, instead of being sawed or otherwise manufactured, are shipped in logs to France, to be there used in the manufacture of furniture, etc.

The receipts of timber at New Orleans during the year 1886 were slightly below the average of previous years, as follows:

	Tons.
Cypress	43,493
Pine	17,002
Oak	4,235
Walnut	1,250
Cottonwood, poplar, and other woods	13,144
Total	79,124
Value	$139,144

Besides the lumber floated down for the saw-mills, logs are rafted down for cord-wood. This business has been somewhat affected lately by the railroads. The building of new railroads, the clearing away of their tracks and felling of trees have thrown large quantities of wood on the market, which is brought to New Orleans for little or nothing. The sources of receipts of cord-wood at New Orleans by the river route are:

The steam-boats, especially those in the Ouachita and Atchafalaya trade, which bring in large quantities of cut wood.

The flat-boats, towed or floated down, which bring wood from upper river points.

Rafts, which are floated down and sold in logs on the river bank, to be cut up there into cord wood.

And the old and broken boats, coal, stave, etc., which, after having made the voyage down the river and being too weak to make the trip up again, are sold and broken up mainly for fire-wood.

The receipts of wood by the steam-boats are given with the steam-boat cargoes.

The wood in boats or barges generally comes from points between New Orleans and Memphis. A coal boat having unloaded her cargo at Vicksburg, Natchez, or some other point, and not being in a boatable condition up stream, is sold to some owner of a wood-yard, who loads her with wood, which is then floated down to New Orleans.

The amount arriving in rafts to be cut up at New Orleans constitutes over one-third of all the cord-wood reaching the city.

In breaking up the old barges and boats such lumber as can be sawed is used.

Amount and value of wood rafted to New Orleans in 1886 *for saw-mills or lumber or wood-yards.*

	Tons.	Value.
Timber*	79,124	$139,144
Cord-wood	13,420	55,609
Total	92,544	194,753

*In logs, value before being sawed,

DISTRIBUTION OF RIVER FREIGHT

What are the sources and points to which distributed of the freight moved on the river in each direction and the proportionate amount transported from each point and distributed to each point of destination?

Few of the smaller towns on the river keep any record of the movement of freight. At those where there are wharf-boats, some statistics are preserved; but generally for this movement the manifests of the steamers have to be depended on for those articles going by steam, and the coal and barge companies and the saw-mills and cotton-seed-oil mills for those towed, floated, or rafted down. The way traffic on the lower river is comparatively insignificant. There are lines of boats between Bayou Sara, Natchez, Vicksburg, and Greenville, generally small vessels, and with not much freight business. The bulk of the business is done by the big boats from New Orleans, Saint Louis, Cincinnati, and Memphis. The chief business of the river towns and landings consists in the shipment of the products of the country either up or down the river to these cities, to be marketed, or the receipt of provisions, supplies, and manufactured goods in return. Between New Orleans and Memphis, the only town having any material tributary river traffic is Vicksburg, which receives the produce of the interior country by the Yazoo, and the Sunflower, Coldwater, and other branches of that river. The way traffic elsewhere is small, the bulk of it consisting in the receipts of logs, cotton-seed, etc., by the mills situated on the river bank. The more important towns have each a territory dependent on it, and to which it distributes goods; but the trade between these several towns is infinitesimal as compared with the other traffic of the river.

The business, therefore, to and from the big cities (Saint Louis, Cincinnati, Memphis, and New Orleans) and that tributary to Vicksburg from the Yazoo, constitutes a large majority of the total traffic, and as the figures for this are full and complete, the volume of river business can be reached with accuracy.

As can be seen from the statistics of New Orleans, already given, the great bulk of this trade is down stream—in fact the freight carried down the Mississippi is double that ascending the river. This is easily accounted for. The whole valley uses the Mississippi as an outlet to the sea. By this route Saint Louis ships its grain to Europe; Mississippi, Arkansas, and Louisiana their cotton, sugar, and rice. The lumber districts of Arkansas, Tennessee, and Kentucky send down stream their many cargoes of lumber and staves. Again, the coal fleets constitute one-fourth of the freight in tons of the Lower Mississippi. There is no corresponding business going up the river. The coal barges return empty; the flatboats that bring down potatoes and provisions from all portions of the West do not return at all, and even the grain barges carry back scarcely a third of the freight with which they descended the river.

The following table gives the movement of freight on the Lower Mississippi River, between Memphis and New Orleans. For some of the smaller towns it has been necessary to estimate the number of tons shipped and received, as there are no accurate statistics on this point. These, however, constitute but an infinitesimal portion of the river business, less than 3 per cent. of the whole.

The receipts at river points were the same as the shipments, except for the losses incurred (about 55,750 tons, worth $475,000).

INCREASE OR DECREASE OF RIVER TRAFFIC.

Give the growth or decrease of river business during the last five or ten years.

There has been a material decline in the river business of the Lower Mississippi during the last five years. This has been more in value than in tonnage. During this period there has been a falling off in the shipment of the more valuable products and an increase int he handling of heavy articles. The barge and floating tonnage has grown; the steam-boat tonnage declined. The following table shows how small are the fluctuations in the receipts of produce at New Orleans during the last few years. Notwithstanding the remarkable changes that have taken place in trade lines and the failures of crops during this period, the river business at New Orleans may be said to have remained nearly at a standstill as far as the number of tons handled was concerned. In values, however, it is quite different, and the up-river trade has suffered severely. The following comparison of the last few years will give some idea of this:

Receipts at and shipments from New Orleans by river, from 1880 *to* 1887.

	Receipts.*	Shipments.	Total.
	Tons.	*Tons.*	*Tons.*
1887	1,718,884	754,182	2.473,072
1886	1,699,225	779,954	2,479,179
1885	1,710,250	812,250	2,522,500
1884	1,656,825	818,990	2,475,815
1883	1,685,220	862,437	2,547,657
1882	1,649,790	901,560	2,551,350
1881	1,742,400	979,600	2,722,000
1880	1,869,825	1,089,425	2,959,250

* Not including rafts.

During this period the receipts by river at New Orleans show a falling off of 9 per cent., and in the shipments up stream of 23 per cent.

The decline varies greatly in the different lines of articles handled and received. There have been heavy losses in the provision trade and in cotton by river. Sugar and rice show a decline; that is, a larger proportion of the crop is brought to market by the railroads than formerly. Grain and breadstuffs have been fluctuating, dependent upon the railroad and ocean freight rates. On the other hand, there has been a large increase in the receipts of coal and coke, staves, lumber, and bulky articles.

The river grain trade of New Orleans has had several ups and downs during the last dozen years. Up to the time of the construction of the jetties it was small and of little moment or importance; the receipts of all kinds of grains never reached much over a million bushels. There were no wheat shipments down the river before 1873, and in 1876 the receipts at New Orleans were but 37,142 bushels. From the date of the construction of the jetties, the grain trade of New Orleans "boomed," and it looked for a while as if the entire surplus grain crop of the West would take the river route to Europe. The shipments were:

	Bushels.
1876	308, 578
1877	1, 774, 398
1878	4, 101, 353
1879	6, 164, 838
1880	15, 762, 664

This was the maximum reached. Several causes conspired to prevent an increase in the shipments of grain by this route. Trunk lines which had handled the business previously saw the necessity of meeting the lower rate by river, and a reduction of the rail rate made the cost of sending grain by way of the Mississippi and New Orleans and the railroads and New York about the same. Moreover, the surplus wheat, in this country for export was less. In 1883 there was a marked decline in the shipments to Europe. In 1885 the receipts at New Orleans were but 50,000 bushels. The year 1886 showed a revival in the river grain business.

The barge company, the Saint Louis and Mississippi Valley Transportation Company, can move 30,000,000 bushels of grain to New Orleans during the year. Its best business was in 1880, when it took 15,762,664 bushels downstream, a little over half its capacity.

The fluctuations in the river grain trade are well shown in the following table of receipts at New Orleans for the past fifteen years:

Receipts of grain by river at New Orleans.

	Wheat.	Corn.	Rye.	Oats.	Total.
	Bushels.	*Bushels.*	*Bushels.*	*Bushels.*	*Bushels.*

* For the New Orleans commercial year, from September 1 to August 31.
† Average for a year.

The receipts of cotton at New Orleans by river have declined for the past ten years, owing to the vigorous competition of the railways and the low rates prevailing. The railroads now reach all the most important river towns, and bid at these for the cotton trade. The Texas and Pacific claims that at any point where it is in competition with the steamers it secures 40 per cent. of the business. On the east bank of the Mississippi the railroad gets an even larger share. At Natchez three-fourths of the business is now done by the railroads; at Vicksburg about an equal proportion. At these points the railroads underbid the boats, and carry the cotton, so the steam-boat men claim, at less than it can be handled for. If the rates are the same from any given competitive point, the railroads naturally secure the bulk of the cotton, on account of the advantage in time and insurance.

To the steamers, however, are left a large field as yet undisputed by the railroads, and it is from this that they get their cotton; but this field has been growing smaller for some years. They have left to them the Red River country, except at Shreveport, Alexandria, and the other few points where the railroad touches the river. They have the Ouachita and most of its tributaries, save where the Vicksburg, Shreveport and Pacific Railroad and the Saint Louis and Iron Mountain Railroad reach it and compete with them. They have most of the west bank of the Mississippi River and the cotton raised on the lands too far distant from the railroad to be hauled to it. In this territory they are without competition, except among themselves and they secure the bulk of the staple produced; but they have lost some of their richest fields, which have been captured by the railroads. The shipment of cotton down stream from the Arkansas and White Rivers to New Orleans virtually ended some years ago. The Yazoo country has been largely lost in the last two years. To-day the Mississippi River, with its many tributaries, brings out very little more cotton to New Orleans than a single railroad.

In six years, during which the railroads have extended their lines into the cotton district, and two roads, the Louisville and New Orleans and Texas and Texas and Pacific, have been built parallel to the Red and Mississippi Rivers, the river cotton business at New Orleans has declined over 60 per cent.

Receipts of cotton by river and rail.

1880-'81	1,059,518	718,869
1879-'80	1,087,997	624,532
1878-'79	911,652	526,921
1877-'78	980,993	631,490
1876-'77	981,939	495,206
1875-'76	1,094,735	487,788
1874-'75	750,080	406,076
1873-'74	941,262	410,298
1872-'73	968,877	438,495

* For the New Orleans commercial year, from September 1 to August 31.

In 1880–'81 New Orleans received its cotton—

By river	1,059,518
By rail	718,869
By ocean steamer	79,600

At that time the following were the chief cotton-shipping points on the Mississippi. The shipments then made compared with those to-day give an idea of the changes that have taken place in the river business:

Chief points on Mississippi from which shipments of cotton were made.

Point.	Bales.	Point.	Bales.
Arkansas:		Mississippi—Continued.	
Helena	52,000	Natchez	39,300
Arkansas City	56,500	Sunflower	1,700
Lenwood	1,300	Vicksburg	132,800
Point Chicot	1,050	Grand Gulf	13,600
Sterling	1,550		
Terrene	30,000	Total	329,200
Gaines's Landing	1,000		
Luna	2,400	Louisiana:	
Leland	1,000	Lake Providence	5,750
Bernard	5,500	Saint Joseph	8,800
		Hard Times	11,500
Total	150,156	Bayou Sara	29,900
		Pointe Coupée	12,500
Mississippi:		Port Hickey	2,200
Glendale	14,000		
Yazoo Levee district	107,500	Total	90,450
Rodney	20,300		

Helena: Cotton from Arkansas Central, Helena, and Iron Mountain Railroad, and Saint Francis River reshipped.

Terrene: Cotton from Arkansas and White Rivers reshipped.

The Mississippi levee district includes Bolivar, Issaquena, Washington, and Sharkey Counties.

Vicksburg: Cotton from the Vicksburg and Meridian, and Vicksburg and Shreveport Railroads, and Yazoo River reshipped.

Cotton shipped by the various steam-boat lines to New Orleans.

Boats from—	Bales.	Boats from—	Bales.
Memphis	166,890	Ouachita River	121,300
Greenville and bends	155,575	White River	16,401
Vicksburg	280,468	Saint Louis and Cincinnati	36,120
Upper coast	80,698	All others	31,579
Red River	171,586		

Compare this with the business done to-day. The Memphis River cotton trade is gone; so is that on White River. Vicksburg and the bends send less than half as much cotton to New Orleans by river as then; Red River barely a third; Ouachita River slightly over half.

If the figures are compared with forty years ago, they present an even more unfavorable showing. In 1842–'43 New Orleans received 1,046,166 bales of cotton by river, and in 1859–'60, 1,946,227 bales by the water route. While the railroads along the Mississippi River have latterly obtained a larger proportion of the sugar crop of the State than formerly handled by them, the boats engaged in the sugar business have suffered less relatively than the cotton boats. They also have railroad competitors throughout the sugar country. The most important of these is the Southern Pacific, which runs through the most productive sugar section of Louisiana, crossing the Lafourche near Thibodeaux and running along the Teche for the greater portion of its navigable length.

The Teche steamers, in competition with it have suffered under the further disadvantage of bad navigation in Old River. As a consequence, the railroad gets the bulk of the sugar in the Teche parishes. Along the Mississippi, however, where the river is in com-

petition with two roads, the Texas and Pacific on the one side, and the Louisville, New Orleans and Texas on the other, they still succeed in securing the bulk of the sugar intended for the New Orleans market, handling about two-thirds of the whole business.

Sugar receipts at New Orleans.

Years.	By river.	By rail.
	Hhds.	*Hhds.*
1886–'87	80,210	40,569
1885–'86	122,339	66,483
1884–'85	89,121	49,201
1883–'84	163,893	57,622
1882–'83	161,814	52,680

The large variations in the total receipts are due to crop failures and change.

Some sugar is taken North by the Saint Louis and Cincinnati boats direct from the plantation. This business has also been affected slightly by the railroad competition, and some of the plantations are now shipping their sugar North by rail direct.

If the river has lost business in cotton and sugar, it has made up for it, as far as tonnage is concerned, in the receipt of coal. The coal receipts of New Orleans have steadily and rapidly advanced. The construction of the New Orleans and Northeastern Railroad direct from the Alabama coal-fields, and the importation of large quantities of coal both by that route and the Louisville and Nashville Railroad, has had no effect upon the receipts of Pittsburgh coal at New Orleans and the other river towns. It is now largely used by the sugar planters in the manufacture of sugar instead of wood, formerly employed by them, and the increased steam ocean tonnage of New Orleans and the more numerous factories of that city also call for a larger supply.

Receipts of Pittsburgh coal at New Orleans by river.

	Boats.	Barges.	Total.
1886–'87*	571	48	619
1885–'86*	509	101	610
1884–'85	389	60	449
1883–'84	339	64	403
1882–'83	363	78	441
1881–'82	413	53	466
1880–'81	371	40	411
1879–'80	356	70	426
1878–'79	144	31	175
1877–'78	404	92	496
1876–'77	210	70	280
1875–'76	205	51	256
1874–'75	266	61	327
1873–'74	256	78	324

A barge contains 450 tons of coal, and a boat 925 tons.
* For the commercial year, September 1 to August 31.

The oak stave trade of New Orleans shows the following fluctuations during the last five years:

Staves received by river.

1886–'87	6,127,400
1885–'86	6,640,240
1884–'85	4,320,476
1883–'84	4,932,000
1882–'83	6,868,320
1881–'82	5,707,872

It will be noted that the principal increase in the river business of New Orleans has been in these articles—grain, coal, staves, etc.—brought down in barges or boats at a very low rate of transportation; and the heaviest loss is in cotton, flour, Western produce, etc.

INFLUENCE OF THE RIVER ON FREIGHT RATES AND COMPETITION WITH RAILROADS.

What influence has the river exerted as a regulator of freight rates; and what are its future prospects and influences as a highway for traffic?

From Memphis to New Orleans the Mississippi River and the Louisville, New Orleans and Texas Railroad run parallel to each other. The road runs through a region which formerly contributed a large amount of tonnage and business to the river boats. It reaches, either with the main stem or with branches, all the important river towns, Baton Rouge, Natchez, Vicksburg, Greenville, and Memphis, and it connects with the roads west of the Mississippi, the Little Rock, Mississippi Valley and Texas Railroad at Arkansas City and the Vicksburg, Shreveport and Pacific Railroad at Vicksburg or at Delta, immediately opposite, and gets from them a large amount of business that reaches the river at these points and that formerly went down it by steamer.

The effect and influence of a water route parallel with a railroad can be best studied here. By the road the distance from New Orleans to Memphis is 455 miles, and 731 miles by river.

Thesteam-boats usually charge $1 per bale for cotton from Memphis to New Orleans, 75 cents from Vicksburg, and 50 cents from points below, like Bayou Sara. Here are the rates by the Louisville, New Orleans and Texas Railroad. The points marked with an asterisk (*) are those at which the steam-boats enter into competition with the railroad:

[The distances are given from New Orleans.]

	Distance.	Freight rate on cotton.
	Miles.	
Baton Rouge*	89	$0.50
Slaughter	108	1.00
Ethel	113	1.25
Port Hudson (on branch road)*	125	.60
Clinton (on branch road)	121	1.65
Wilson	122	1.50
Port Gibson	206	1.75
Vicksburg*	235	.75
Rolling Fork	279	2.00
Greenville (on branch road)*	328	1.00
Clarksdale	379	2.25
Memphis	455	1.00

The average charge for the transportation of a bale of cotton is .435 cent per mile in competition with the river, and .86 cent when free from water competition. The river reduces freight rates just one-half. Those towns situated within reach of the boats get their cotton hauled for half what the interior towns off the river have to pay. The rates on other freights show about the same difference.

Freight rates by the Louisville, New Orleans and Texas Railroad.

[Per 100 pounds.]

Points.	Distance.	Class 1.	Class 2.	Class 3.	Class 4.	Class 5.
	Miles.	*Cents.*	*Cents.*	*Cents.*	*Cents.*	*Cents.*
Ethel	113	62	54	45	39	32
Natchez*	230	50	40	30	25	20
Port Gibson	206	65	55	45	40	35
Vicksburg*	235	50	40	30	25	20
Rolling Fork	279	65	55	45	40	35
Memphis*	455	65	50	38	30	25

*The charge on the first-class freight is at the rate of 15 cents per mile for points where the river affords competition and 32 cents where there is no competition.

These companies were, through the change of the railroad and through most of the others, in competition with the river. It fixes mathematically the value and influence of the Mississippi in controlling rates. The water route reduces the charges one-half wherever its influence is felt, wherever it is within reach, or wherever its tributaries extend, the rates averaging half what they are in other sections not similarly favored.

This influence does not extend to the immediate banks of the river, but for some distance inland. The Clinton and Port Hudson Railroad crosses the Louisville, New Orleans and Texas Railroad at Ethel. It was formerly tributary to the river, the cotton from East Feliciana being shipped to Port Hudson and there loaded on boats. It now moves in a different direction and goes to New Orleans by rail.

The following are the charges from points on this branch road to New Orleans:

	Miles from New Orleans by rail.	Freight on cotton.
		Bales.
Clinton	121	$1.65
Brown's	115	1.50
Bell's	116	1.00
Lindsay	120	.75
Port Hudson	126	.60

It will be noted that the railroad rate decreases the further the cotton has to be hauled and the nearer it gets to the river. It does not follow that the steam-boats get the business; as a matter of fact, the bulk of the cotton in the country through which this road passes, and a great majority of it at the towns where there is free and open competition, goes by rail; but although it takes the rail route, the latter is affected and influenced by the river, which fixes the price of the freight charges. In the same manner as the river has affected the rates from points along the Upper Mississippi to the sea-board, it has regulated these throughout the Lower Mississippi region. When through any cause the river is closed to navigation at any point, the complaint is made that rates advance.

The river has cheapened freight rates throughout the Lower Mississippi Valley, wherever its influence can be felt, one-half. It is claimed by the river men, and so asserted by the New Orleans Cotton Exchange in its brief before the Interstate Commerce Commission, that the railroads have latterly been taking freight from river points at a less rate and "recouping" themselves elsewhere. The cost of transportation by river is capable of being greatly cheapened. The river steamer of ten years ago was expensive and expensively run. There was no competition with the railroads, and at the rates then prevailing a handsome profit was realized. It is being generally recognized that the old-style boat can not be run with profit to-day. The handsome cabins and saloons are a reminiscence of the days long since past when all the passenger business of the Lower Mississippi Valley was by river. It is largely gone now, for time is so important an element in traveling that one scarcely cares to lose a day by going the river route. The river steamer is becoming more and more each day a freight boat; or rather the probabilites are that there will be boats of two classes, for passengers and freight, like the railroads, instead of one carrying both together. Last season some of the finest steamers in the New Orleans trade lay idle at the wharf two-thirds of the time because it did not pay to run them. Few new boats of this kind are being built. The new steamers of the Mississippi are being more solidly and strongly constructed for freight business.

During the last two seasons the river boats have been compelled to carry on their business at rates from 10 to 20 per cent. cheaper than previously. To make any profit it has necessitated constant activity, some of the boats being kept running nearly every day. Any further reduction in rates is difficult, if not impossible, without a loss, for the margin of profit is small now. The only resource is simpler and cheaper boats, or the adoption of the barge system. The shipment of freight down the river by barge defies any competition by the railroads, and is the cheapest form of transportation known anywhere. The coal barges are loaded at Pittsburgh and brought down to New Orleans, a distance of 1,928 miles, at the rate of 10 cents a barrel, or .00259 cents per 100 pounds a mile. The competition at New Orleans and all the Lower Mississippi points between the railroads and the river routes dates wholly since the war; and at New Orleans has occurred mainly in the last few years. That competition has been active and vigorous, and has exerted a marked influence on the trade and commerce of the Mississippi.

At the time of the outbreak of the late war railroads touched the Lower Mississippi at only four points, Memphis, Vicksburg, Delta, opposite Vicksburg, and New Orleans. The Pontchartrain Railroad at New Orleans had been constructed as early as 1837. It

was only 7 miles in length, but did away with the necessity of vessels ascending the new and Carondelet canal. All cotton and produce from Mobile, Pensacola, and other Florida ports was then carried by steamers to Milneburg, the lake terminus of this road, and thence by the railroad to New Orleans. The line was purely a local one and of little importance commercially.

The next road reaching the Mississippi, and in anywise affecting it, was the Vicksburg and Jackson, from Vicksburg to Jackson, opened in 1841. This was for twenty years a mere branch or tributary to the Mississippi River, an outlet for the cotton of central Mississippi, which could not be readily reached by steam-boat or flatboat. It brought some 100,000 bales of cotton annually to Vicksburg, which were thence transshipped by boat to New Orleans. The railroad acted as a feeder to the river, in no wise competed with it, and indeed brought freight to it that might have found another outlet to market. In 1860 this road, by consolidation with the Southern Mississippi Railroad, was extended to Meridian, where it met the Mobile and Ohio Road, thus giving the cotton in the interior the alternative of going south to Mobile or north to Saint Louis and Cincinnati.

In 1852 two new railroads were begun from New Orleans—the New Orleans and Opelousas, running westward, and the New Orleans, Jackson and Great Northern northward. The latter was opened to Canton, Miss., in 1859, and by the Mississippi Central to Jackson, Tenn., in 1860. The Opelousas road extended to Brashear (now Morgan City), which remained its terminus for over twenty years before it was extended to Houston, Tex., to ultimately become the main stem of the Southern Pacific.

The fourth road to reach the Lower Mississippi was the Mississippi and Tennessee Railroad, completed from Grenada, on the line of the Mississippi Central, to Memphis in 1857. The Memphis and Charleston, from Chattanooga to Memphis, was completed in 1858. In 1861 the Vicksburg, Shreveport and Pacific was opened from Delta, La., opposite Vicksburg, to Monroe on the Ouachita River.

These were all the roads built in the region tributary to the Lower Mississippi when war interrupted commerce and railroad building in the Southern States.

It will be seen that these railroads were more or less tributary to the Mississippi, reached points beyond the boats, and could, therefore, scarcely be considered as competing with the latter. The New Orleans, Jackson and Great Northern Railroad had connection with Memphis and Vicksburg, but did not bring much freight from those points. The Opelousas or Louisiana and Texas road brought some produce from bayous Teche and Lafourche, but did not materially affect the business of the boats running on these streams. On the other hand, the railroads, particularly the Memphis and Charleston, Vicksburg, Shreveport and Pacific, Vicksburg and Jackson, brought cotton from the interior to the Mississippi to be shipped by boats to New Orleans.

The war made little change in the Southern roads, and at its completion the same lines remained, the additions being a portion of the Memphis and Little Rock, from Memphis towards the Arkansas capital, and the Memphis branch of the Louisville and Nashville Railroads, however, touched the river at all points above. There were four lines at Cincinnati, three at Louisville, and five at Saint Louis.

The two railroads centering at New Orleans, the New Orleans, Jackson and Great Northern and the Louisiana and Texas, both handled some freight which had formerly been carried by boats, the one from Memphis and Vicksburg, the other from the Teche, Lafourche, and Atchafalaya, but it was infinitesimal compared with the total traffic of the river, and with the diversion that was soon to follow.

In 1870, the completion of the New Orleans, Mobile and Texas Railroad (now the New Orleans and Mobile branch of the Louisville and Nashville) did away with the steamers between New Orleans and Mobile, from 97 to 98 per cent. of the cotton and other freight being shipped by rail. The Mobile and lake steamers altogether disappeared, and the arrivals of steamers in New Orleans to-day from Mobile are not over three or four a year.

The most important invasion of river traffic was that made by the construction of the New Orleans and Pacific branch of the Texas and Pacific Railroad, from New Orleans to Shreveport, which was intended to give the Texas Pacific Railroad an outlet from Texas to the seaboard. It was the first road in the region tributary to New Orleans parallel to an important navigable stream touching the Mississippi River and competing with it at numerous points. The New Orleans and Pacific took the old road of the New Orleans, Mobile and Texas Railroad, running along the Mississippi to Baton Rouge, and cut thence in a northeasterly direction, crossing the Atchafalaya River and running almost parallel to Red River to Shreveport. It thus became the competitor of the boats at all points on the Lower Mississippi as high as Baton Rouge, on the Atchafalaya, and at Alexandria, Shreveport, and other points on Red River. This line was completed in 1881. Hahnville, Donaldsonville, Plaquemine, Port Allen, Baton Rogue, Alexandria, and Shreveport thus became competitive points between the railroad and river boats. The

result is shown in the following figures of the receipts of cotton from Red River and the Texas and Louisiana regions tributary to it:

Cotton.

Year.	By river.	By rail.
	Bales.	*Bales.*
1877–'78	193,800	.....
1878–'79	145,119	.....
1879–'80	144,616	.....
1880–'81	186,585	.....
1883–'84	104,039	140,198
1884–'85	54,726	197,632
1885–'86	61,661	223,898
1886–'87	55,128	322,538

It is scarcely necessary to point out the lesson of these figures. The increase in the receipts from the Red River section is due to the cotton brought by the Texas and Pacific Railroad from Northern Texas and transferred at Shreveport. Of the Shreveport cotton the railway claims to carry four times as much to New Orleans as the boats.

Before the construction of the New Orleans and Pacific Railroad the Red River boats had been injuriously affected by the bad condition of that stream, particularly the mouth, which grew shallow during the very season when business was briskest, seriously interfering with the transportation of freight by river.

In 1883 was commenced at several points the construction of a railroad which was to be a far more serious competitor with the river boats. The Louisville, New Orleans and Texas Railroad, more generally known as "the Mississippi Valley," runs parallel with the Mississippi River between New Orleans and Memphis, and is therefore, of necessity, a competitor. The main line or branches touch the river at all important shipping points on the east bank of the river.

Other railroad lines affecting the commerce of the lower river are as follows:

Clinton and Port Hudson road, opened in 1833; a small line, tributary to the Mississippi until the completion of the Louisville, New Orleans and Texas, when it became a branch of that road, diverting freight which had hitherto been shipped from the interior to Port Hudson and thence by river.

The West Feliciana Railroad, completed in 1842. This is also a small line, running from Bayou Sara to Woodville, Miss. It is without railroad connections, and wholly tributary to the Mississippi, bringing out the cotton and other freight from the interior for transshipment by boats down the river.

Natchez, Red River and Texas Railroad; a small line, similarly tributary to the river.

Natchez, Jackson and Columbus, from Natchez to Jackson, completed in 1882. This road now connects with the Louisville, New Orleans and Texas, and diverts a considerable amount of freight from the river by rail to New Orleans, so much so that Natchez, which was formerly the most important river town between New Orleans and Louisville or Saint Louis, is now without any regular packet line from the Crescent City, and dependent on the Vicksburg boats. It receives to-day three-fourths of the supplies from the railroads, whereas five years ago it was wholly dependent on the river.

Louisiana Central, Baton Rouge to Mission, a small line bringing freight from the interior, the Grosse Tête country to Port Allen, opposite Baton Rouge, whence it is shipped by rail or river to New Orleans.

Little Rock, Mississippi Valley and Texas Railroad, recently purchased for the Missouri Pacific system, extending from Arkansas City to Pine Bluff and Little Rock, with a branch running westward towards the Ouachita. This road connects with the Louisville, New Orleans and Texas Railroad, to which it transfers a large quantity of cotton and other freight from along the Arkansas, and which formerly came by way of the Arkansas boats to New Orleans.

The Helena branch of the Iron Mountain Railroad from Helena northward to the main line of that system connecting at Helena with the boats for New Orleans, Saint Louis, and Memphis.

The New Orleans and Lake Borgne Railroad, a small line, touching the Mississippi at several points below New Orleans, and competing with the lower coast packets.

The railroads now reach the Mississippi at all the important towns. With the exception of Bayou Sara, there is not a town on the Lower Mississippi of over 1,000 population which is without railroad connection with New Orleans, Saint Louis, or Memphis. Bayou Sara possesses a line, the West Feliciana Railroad, but as yet unconnected with the other systems. Indeed, there are but few shipping points on the Mississippi of any importance without railroad connections.

Points on the Mississippi between New Orleans and Memphis with competition between river and rail.

The difference in the position of the steam-boats and railroads in 1887 and 1866 can readily be appreciated. The result has been actual competition, which has been specially marked in the last few years. Of the seven lines centering in New Orleans all compete with the river route. The New Orleans and Northeastern is the least affected by this competition, although it is an air-line from New Orleans to another river point, Cincinnati.

The New Orleans and Lake Borgne Railway, from New Orleans to Portersville, or Shell Beach, runs near the bank of the river to the south, transporting quantities of rice,

sugar, and vegetables that had formerly been sent by boat. This road is to be extended southward to Pointe à la Hache.

The Illinois Central, connecting with lines to Memphis and Vicksburg—competition with the river smaller than formerly since the completion of the Louisville, New Orleans and Texas Railroad.

The Louisville and Nashville, competing at Memphis, Paducah, Louisville, and numerous other points.

The Southern Pacific, competing at points on the Mississippi, just above New Orleans, and on all points on the Teche, Lafourche, Courtableau, Boeuf, and other streams in Central Louisiana. The result has been to greatly affect and reduce the regular steam-boat business on the streams.

The Texas and Pacific from New Orleans to Shreveport, competing with the boats at all points on the Lower Mississippi to Baton Rouge, on Bayou Grosse Tête, the Atchafalaya, and on Red River, at Alexandria and Shreveport.

The Louisville, New Orleans and Texas Railroad, competing at nearly all points on the east bank of the Mississippi, between New Orleans and Memphis, particularly at Baton Rouge, Port Hudson, Natchez, Arkansas City, Vicksburg, Greenville, and Memphis.

The railroad business at New Orleans has steadily advanced since the war, and its advance has been largely at the expense of the steam-boats. The following table shows the tons of freight handled by the roads for the past sixteen years:

Railroad business—Tons of freight handled at New Orleans.

Years.	Received.	Shipped.	Total handled.
	Tons.	*Tons.*	*Tons.*
1872–'73*	285,960	174,320	464,240
1879–'80	543,076	455,712	998,788
1880–'81	558,261	474,275	1,032,536
1881–'82	685,020	555,659	1,240,679
1882–'83	884,223	597,510	1,481,733
1883–'84	894,371	623,618	1,518,186
1884–'85	1,003,185	619,784	1,622,969
1885–'86	1,125,809	635,448	1,761,247
1886–'87	1,344,430	746,146	2,090,576

*For the railroad year ending June 30.

Up to 1882–'83, there were but three roads operating; in 1882–'83, four; 1883–'84, five, and in 1884–'85 six.

The advance has been steady and without a single set back. In fourteen years the railroads have quadrupled their business; in six years doubled it. The comparison of business by rail and river shows at what rate business had been diverted from the steamers to the railroads:

Railroad and River competition.

Years.	Value of receipts at New Orleans.	Receipts.	
		River.*	Rail and canal.*
1872–'73	$184,620,047	$144,168,477	$44,452,477

* Partly estimated.

There has been, so far, no check on the increasing business of the railroads at the expense of the steam-boats. The latter made various appeals to the public, reduced rates, etc., ran the boats on a cheaper basis, but without any effect whatever in the way of regaining this lost trade. The railroads pursued the policy of cutting rates to all river competing points and of establishing, wherever that promised well, tributary steam-boat lines.

The discussion of this question in Congress and the passage of the interstate-commerce act led many to believe that this law would have a marked effect on the river and rail competition.

The interstate-commerce bill had no permanent effect on either the railroad or river business. The first news of its passage aroused the hopes of the river men that another brilliant steam-boat epoch was about to open on the Lower Mississippi. Several of the railroads competing with the steam-boats, notably the Texas and Pacific, advanced freight rates from 25 to 100 per cent. the greatest increase being in pork, bacon, and Western produce. With rare exceptions the steam-boats made no changes in their rates. As they were still subject to the competition of other water craft, and as there were independent boats in nearly all the trades, an increase in rates was almost impossible. In one or two trades they were slightly advanced to the low-water figures, but they were soon afterwards put back to the old tariff. The temporary suspension of the fourth clause, in regard to the long and short haul, which was regarded as the most important in its relations to the steam-boats, interrupted any hopes that the river men may have formed, and a definite decision and explanation of the meaning of this clause was waited for before taking any action. A number of new steam-boats had been ordered by the owners of the packet lines from New Orleans, conditional upon such a decision by the Railroad Commission of the meaning of this fourth clause as would be favorable to the river interests. All the plans and specifications of these boats had been furnished, and the expectation was of a large increase in the river traffic the coming season.

The Railroad Commission sat in New Orleans in May to hear testimony relative to this clause, and as to the competition of the railroads and river. It also sat at Memphis and other points. At New Orleans the steam-boat men presented a strong petition against any suspension of the fourth clause.

The various commercial exchanges in New Orleans, the Cotton, Produce, and others, all sided with the views of the river men, and urged the strict enforcement of this disputed clause. In Memphis, on the other hand, the Merchants' Exchange presented a memorial asking for its suspension.

At both towns a vast mass of information was obtained as to railroad and river charges, competition, etc., both for and against the strict construction of this clause. Subsequently the Commission sat at Washington, and heard rebuttal testimony as to rail and river competition at New Orleans, Vicksburg, Memphis, and other river points.

During the short time that elapsed between the interstate-commerce law going into effect and the final ruling of the Commission on the long and short haul clause, the bill can not be said to have had any effect upon the river business between New Orleans and Memphis. It did, however, affect slightly that between New Orleans and Saint Louis, largely on account of its effect on the trunk lines from the latter city. There was a marked increase in the shipment of grain by river to New Orleans, and whereas scarcely any wheat had come down the river the previous season, many million bushels now took this route. The shipments up the river, both by steam-boat and barge, of freight received by ocean steamer from New York, instead of being sent by the all-rail route to Saint Louis, showed a large increase, and the up-river movement improved, both in the quantity and quality of freight carried, and included many manufactured articles which had previously gone by rail, such as dry goods, carpets, etc.

Whatever benefits the steam-boat men expected from a strict construction of the fourth clause of the interstate-commerce bill, which would prevent the railroads from cutting rates at river points, disappeared before the late ruling of the Commission, to the effect that the circumstances at these competing points were so dissimilar that the railroads were not prevented from charging less for the long than for the short haul. The orders that had been given for new steam-boats were at once rescinded, the hopes of the river men disappointed, and it is no exaggeration to say that steam-boat property fell in value.

Since this decision there had been up to October, 1887, little business on the river worth speaking about. The boats generally begin the season in September, when the rice crop is being harvested and hurried to market; then follow the cotton and sugar seasons. It was too early in October to tell whether the interstate-commerce bill, as finally interpreted by the commission, will exert any influence on river trade, and whether it will be better or worse than last year. It is not likely that the ruling will affect in any way the business on that portion of the river below Memphis, but it may have a beneficial effect on business between New Orleans and Saint Louis.

The following facts give some idea of the competition between rail and river at various points.

Shreveport-cotton competition between the Red River boats, Texas and Pacific Railroad, and Vicksburg, Shreveport and Pacific Railroad. The shipments from Shreveport are by—

	Per cent.
River	10
Texas and Pacific	45
Vicksburg, Shreveport and Pacific	39
Other routes	6

The Texas and Pacific claims to take 40 per cent. of all the trade at points where it comes into competition with the river route.

MEMPHIS.

Cotton shipments by river and rail to New Orleans.

Year.	River.	Rail.
1883–'84	54,614	77,252
1884–'85	40,085	97,187
1885–'86	18,819	89,939
1886–'87*	279	125,907

* For less than a year.

The New Orleans and Memphis trade, which had given employment in the past to a line of steamers, became so poor in 1886–'87 that no boats whatever were run in it. The railroad rate from Memphis to New Orleans has been $1 a bale, but on "through cotton" it was estimated by a member of the New Orleans Cotton Exchange to be under 65 cents.

The following table shows the inroads the railroads have made upon the cotton business, which is the largest element of New Orleans' commerce:

Receipts of cotton at New Orleans by river and rail in bales.

Years.	River.				Rail.					
	Mississippi River, etc.	Red River.	Ouachita River.	Arkansas River.	Illinois Central. (C., St. L. & N. O.).	Louisiana and Texas (Southern Pacific).	Louisville and Nashville.	Texas and Pacific.	New Orleans and Northeastern.	Louisville, New Orleans and Texas.

* From September 1, 1887, to January 1, 1888.

FREIGHT FERRIES ACROSS THE MISSISSIPPI.

What is the character and amount of the traffic across the Mississippi River between Memphis and the Gulf, and the facilities for traffic across it?

There are no bridges on the Lower Mississippi. A charter has been granted for one at Memphis, but nothing has been done yet in regard to it. At New Orleans the matter has been discussed and a bridge has been pronounced practicable by the leading engineers, among them Mr. James B. Eads, but no plan or suggestion has been made.

Between Memphis and New Orleans the following railroads reach the Mississippi from the west or east and make connection with roads on the other side, freight being transferred across the river in ferries:

ON THE WEST SIDE.

Saint Louis and Iron Mountain Railroad (Helena branch) and Arkansas Midland, at Helena.

Little Rock, Mississippi River and Texas (Arkansas Valley route), at Arkansas City.

Vicksburg, Shreveport and Pacific, at Delta, opposite Vicksburg.

Natchez and Texas, at Vidalia, opposite Natchez.

Texas and Pacific (Baton Rouge branch) and Louisiana Central (Baton Rouge and Grosse Tête road), at Port Allen, opposite Baton Rouge.

Texas and Pacific (main stem) and Southern Pacific, at Algiers and Gretna, opposite New Orleans.

ON THE EAST BANK.

Georgia Pacific, at Glendale, opposite Helena.

Louisville, New Orleans and Texas, at Huntington, opposite Arkansas City, and at Vicksburg.

Vicksburg and Meridian, at Vicksburg.

Natchez, Jackson and Columbus, at Natchez.

Louisville, New Orleans and Texas, at Baton Rouge.

Louisville and Nashville, Illinois Central, Cincinnati, New Orleans and Texas Pacific, and Louisvlle, New Orleans and Texas, at New Orleans.

All the roads on the west bank use ferries for carrying the freight from one side of the river to the other, those of the Texas and Pacific and Southern Pacific being among the largest boats upon the Mississippi, and carrying a whole train of cars at a time. The roads on the east bank make no such connection.

The business of the Helena branch of the Saint Louis and Iron Mountain road across the river is insignificant. The road is as yet mainly a tributary to the Mississippi, and but an infinitesimal proportion of the business handled by it goes across the river.

At Arkansas City, where the Little Rock, Mississippi River and Texas Railroad reaches the river on the west side, forming a connection, by means of a steam ferry, with the Louisville, New Orleans and Texas Railroad opposite, the business is large and increasing. By this route large amounts of cotton formerly shipped to New Orleans by way of the Arkansas River now comes direct by rail. Large quantities of Western produce, pork, etc., also come by this route via Little Rock. The receipts from the Arkansas Valley road now constitute a large share of the business brought into New Orleans by the Louisville, New Orleans and Texas line.

At Vicksburg, the Vicksburg, Shreveport and Pacific Railroad from Shreveport, crossing the Red, Ouachita, Macon, Tensas, and other streams of northern Louisiana tributary to the Mississippi, which still send large quantities of freight via the river, connects with the Vicksburgand Meridian and Louisville, New Orleans and Texas Railroads. This road, the Vicksburg, Shreveport and Pacific, formerly delivered a large proportion of the business to the boats, but this is now mainly transferred across the river to the railroads. The boats now give this road at Vicksburg or Delta 30,653 tons of freight, receiving in return 869 tons, the rest being ferried across the river. By this route large quantities of Western produce are brought down the river from Saint Louis and Cincinnati, and shipped by rail to interior points in north Louisiana and even in Texas.

The shipments across the river at Natchez are small. When boats are not running on the Tensas shipments are occasionally made by the Natchez and Texas Railroad, and cotton sent by this all-rail route South or East. The movement, however, is never of much moment.

The ferry business of the Texas and Pacific Railroad at Baton Rouge, formerly large, is insignificant to-day. The branch road was built at a time when Baton Rouge, the capital of Louisiana, was without any rail communication with New Orleans. Both towns are on the east bank of the river, whereas the railroad is on the west bank. To ship freight, therefore, from one point to another required two ferriages over the Mississippi.

The subsequent construction of a direct line between the two cities has obviated such an unnecessary and circuitous route.

At New Orleans two roads reach the river on the left or west bank, the Texas and Pacific and the Southern Pacific; and four on the right or east bank, the Louisville and Nashville, Louisville, New Orleans and Texas, Illinois Central, and Cincinnati, New Orleans and Texas Pacific. There is a large transfer business between these several roads which is steadily increasing; but the bulk of the freight being transferred across the river from the west to east is for consumption in New Orleans or shipment by ocean vessel to foreign or coastwise ports. The shipments from the east to the west-bound roads consist largely of articles sent through by rail from interior points to western Louisiana, Texas, and the Pacific.

The Southern Pacific Railroad, which does a majority of the railroad business entering the city from the West and leaving it in that direction, owns a line of steamers running between New Orleans and New York. The New York business never crosses the river. When a steamer of this line reaches "the Crescent City" it lands at the New Orleans landing of the company, unloads there the freight intended for city consumption, for the steam-boat and barge lines and for the railroad on the east bank; after which it is moved over to Algiers, the western suburb of New Orleans, where it discharges its cargo for Texas and California points. Similarly, on leaving New Orleans the boat is loaded with the cargo received from Western points, directly from the cars on the Algiers side of the river; and at New Orleans with the freight coming by the Eastern trunk lines. The California and Texas freight from the West destined for New York, and the New York freight destined for Texas and California is, therefore, not ferried over the river.

The following is the amount of freight ferried across the Mississippi River at points between Memphis and the Gulf:

Locality.	East to west.	West to east.
	Tons.	*Tons.*
Arkansas City	49,737	12,551
Vicksburg	18,452	26,578
Baton Rouge	3,197	2,218
New Orleans	300,436	147,320
Other points (Helena, Natchez, etc)	4,225	2,100
Total	376,047	190,767

Total ferried across the Mississippi, between Memphis and New Orleans, 566,814 tons.

Of the freight crossing the river at New Orleans, nearly three-fourths goes no further east by rail, but is stopped there simply for the purpose of exporting it.

Of the freight ferried across the Mississippi River between Memphis and the Gulf, the following are the most important items:

SENT EAST.

Articles.	Quantity.	Articles.	Quantity
	Tons.		*Tons.*
Cotton	128,520	Cottonseed	7,645
Sugar and molasses	54,630	Salt	7,320
Cattle, sheep, etc	34,440	Wool	4,200
Manufactured goods	30,200	Hides	2,870
Flour and grain	18,520	Miscellaneous	63,852
Lumber, shingles, and other forest products	15,750	Total	376,047
Rice	9,100		

SENT WEST.

Manufactured goods	85,220	Flour and grain	3,680
Coal	27,460	Lumber	1,020
Merchandise	21,420	Miscellaneous	33,531
Rails and railroad materials	10,236		
Vegetables	8,200	Total	190,167

Value of freight sent East	$42,131,540
Value of freight sent West	15,119,208
Total value of freight carried across the Mississippi	**57,250,748**

HELENA BRANCH OF SAINT LOUIS, IRON MOUNTAIN AND SOUTHERN RAILROAD.

Tonnage received from and delivered to boats and tonnage ferried across the river at Helena, Ark., during year 1886.

Months.	Received at Helena and destined to points up or down the river.	Received at Helena by boat and forwarded northward by Saint Louis, Iron Mountain and Southern Railroad.	Ferried across the river at Helena.	Total.

CHANGES AND FLUCTUATIONS IN RIVER BUSINESS.

Give a complete and historical sketch as to the volume and characteristics of the commerce of the river from the earliest period of its commercial development to the present time; the changes wrought in its commerce and the methods of conducting it as a result of the development of railway traffic, and the future of the river as a factor in the transportation problem of that section of the country, etc.

There are several eras, somewhat vaguely divided from each other in the commercial history of the Lower Mississippi:

1. The French and Spanish dominion, when the mouths of the river and a large portion of its course was controlled by France or Spain. It is only in the last few years of the Spanish dominion, when the American settlers had poured over into the Ohio valley, that the river trade attained any importance whatever.
2. The period of flat-boats and barges, extending from 1803, the year of the purchase of Louisiana, to 1816, when the steam-boat was an acknowledged success, not only in going down, but up stream against the current.
3. The early steam-boat period, 1816 to 1840, when the river found its first competitor for the traffic of the Mississippi Valley in the canals built westward from the Atlantic seaboard.
4. From 1840 to 1860, when the river route came into competition with railroads.
5. The war period of almost total suspension in river traffic.
6. The *post-bellum* period of active rivalry between river and rail.

These different eras are marked by changes in trade lines, and means of transportation, and by the vessels used in navigating the river; first, bark canoes, then pirogues, bateaus, barges, flat-boats, keels, and finally steam-boats.

THE FRENCH AND SPANISH DOMINION.

Although the early French settlements were made altogether on the Mississippi or its chief tributaries, like Red River and Bayou Lafourche, and travel from point to point was by the river, the Mississippi was of no importance whatever as a commercial factor. The great valley which to-day clothes and feeds so large a proportion of the world, was actually not self-supporting. The imports were larger than the exports, and but for the assistance given by the original grantee of Louisiana, Crozat, and afterwards by the French Government itself, the colony would have died out from actual starvation, the records noting no less than three serious famines.

The early mode of traveling on the river is described by Bienville in his exploration in 1699, which ascended nearly as high as Natchez. The Frenchmen used the ships' boats of the fleet, and canoes made of bark or hollowed from the trunks of trees, almost similar in style and build to those of the Indians.

He left a fair record of the topography of the river at the time, and has thus enabled the engineers of later days to note what changes have taken place in the channel of the river in the past two centuries. He himself was a witness of the beginning of the Pointe Coupée cut-off, and notices in his account of his first trip there, the river was trickling around a point just below the mouth of Red River.

At that day the Indians along the Lower Mississippi, the Houma's, Bayagoulas, Natchez, and Tensas, were dying off as fast as they could—they are all extinct to-day—and the river was as dead commercially as it is possible to conceive. The Indians carried

on no business or commerce whatever with each other; indeed on account of the overflowing of the banks, the settlements directly on the Mississippi were few, the aborigines seeking the highlands or mounds which are to be found here and there some miles back of the river. M. Bienville went for miles and days without seeing an Indian, but notices that the eastern bank of the river, near Baton Rouge, was crowded with buffaloes.

The subsequent explorations of the Mississippi and the selection of New Orleans as a location for the future capital of the colony were made in French men-of-war and yawls. The early colonists adopted the Indian bark canoe, which was exceedingly light and, even when freighted, easily handled. When any difficulty was encountered in the river, either in snags or on account of the current, or when it was found shorter to cut across a point rather than take the long circuitous trip around it, these boats were hauled out of the water, just as Bienville had done, and carried by the Indian or negro slaves until the river was reached again.

The settlement of Lower Louisiana, however, and the increasing demands of trade required vessels of a different character and greater carrying capacity than these canoes, and the pirogue—a vessel peculiar to Lower Louisiana—came into play to supply the need. The pirogue is simply a log canoe—a solid log of cypress or live-oak which has been cut out in the center, and is propelled by paddles rather than oars, worked first on one side and then on the other. It is astonishing how long this primitive boat continued in use. Pirogues, indeed, exist to this day in Louisiana, but only for hunting, never for commercial purposes. The modern pirogue is small and holds at best two men. The propeller of the vessel stands erect, using his paddle with skill and agility, for it requires but the slightest tilting of the boat to overturn it. The commercial pirogue of early Louisiana was generally somewhat larger, from 2 to 5 tons, and propelled by negro slaves, a mast and sail being occasionally used when the wind was favorable. In one of these as many as 20 bales of cotton or 30 barrels of molasses could be floated down to New Orleans, the light vessel being easily paddled back to the plantation. Although of the most primitive character, and the first craft used on the Mississippi, unless we except the bark canoe of the Indians, the pirogue survived in river commerce for over a century, and as late as 1830 a considerable amount of the produce of Louisiana reached the market in these log canoes.

Besides the pirogues, the river craft in use in these early days were the batteaux (French for boats), and various nondescripts. The batteaux were generally in use in the upper country, and meant for longer voyages than the pirogues. They were of rough plank, long in proportion to their breadth, and something in the shape of a coffin. They were never very popular on the Lower Mississippi, and died an early death, although even as late as 1825 an occasional batteaux reached New Orleans from some extreme point in the wild Indian country west of the Mississippi.

The French settled the Mississippi Valley both at its head and at its mouth about the same time. After Bienville had made his exploration of the Mississippi, but before New Orleans had been founded, or indeed dreamt of, they had made several settlements within the limits of Pennsylvania, Ohio, and Indiana.

FIRST SHIPMENT BY THE MISSISSIPPI.

The first shipment down the Mississippi was made in 1705, when the French *voyageurs* in the Indian country around the Wabash collected from the several hunting posts in that neighborhood some 10,000 deer and 5,000 bear skins and shipped them down the river. The experiment was a success, although the cargo had a long and dangerous voyage to make. The *voyageurs* traveled in their boats 1,400 miles without seeing a white man, through a country the population of which was mainly hostile. The trip was successfully made down the Ohio and Mississippi to the mouth of Bayou Manchac, which then opened into the river some 15 miles below Baton Rouge, but which has been closed to navigation since Jackson's day. Instead of going down the Mississippi to the mouth—there was no settlement below and no point at which the cargo could be loaded on ocean-going vessels—these early merchants went down Bayou Manchac and the Iberville River (now the Amite), thence through lakes Maurepas and Pontchartrain to the French settlements on Mississippi Sound at Biloxi (now Ocean Springs). From there the produce of the chase in Ohio and Indiana was sent to Mobile, whence it was shipped to France. It arrived there safely and the transaction proved a profitable one.

The *voyageurs*, however, who had made the long trip down the river never returned home, but settled in Louisiana. From the forests in Central Ohio these hides had been conveyed, mainly in open boats, some 1,400 miles by river and lake and 4,500 by sea, it taking more than half a year for them to reach their destination. This is the first reported commercial transaction on the Mississippi, and it is gratifying to know that it was a successful one to all those interested. It was the beginning of a trade that grew with years, and which, indeed, was the largest item of commerce at New Orleans for

many decades of its early history. By 1720, when the Illinois country, both on the Illinois and Mississippi Rivers, was settled by the pioneers from French Canada, the shipments down the river included some other articles besides those of the chase, and agricultural products were shipped by the Mississippi, mainly for use on the Gulf coast, which did not produce enough food for its support during the first half century of the colony's existence. A small amount of these food products was shipped to the West Indies.

The French Western Company, under Crozat, had been granted a monopoly of the trade of the Mississippi for twenty-five years, but this was so unprofitable that the company, after holding it for fifteen years and sinking a large amount in the experiment, surrendered its monopoly, and Louisiana, which then included the entire Mississippi Valley, became a crown colony. The total exports from the valley amounted at that time to $62,000, of which 65 per cent. were skins shipped from the upper river country. Under the French crown there was little improvement, and the colony was never self-supporting while in French possession, the Government being compelled to make good a large deficit each year.

EXPORTS FROM THE MISSISSIPPI VALLEY.

In 1763, when Louisiana was transferred to Spain, the total export trade of the colony was estimated as follows:

Indigo	$100, 000
Deer skins	80, 000
Lumber	50, 000
Naval stores	12, 000
Rice, peas, and beans	4, 000
Tallow	4, 000
Smuggled trade	54, 000
Total	304, 000

The deer-skins and tallow came from the upper country; the indigo was mainly from Louisiana; the naval stores were produced in the Mississippi Sound country, which, although a part of Louisiana at the time, is not within the limits of the Mississippi Valley.

Under the Spanish rule Louisiana rapidly advanced commercially. The importance of the Mississippi was beginning to be recognized, and the great powers of Europe soon became involved in a game of intrigue for its possession. The population of the Lower Mississippi country—what is now Louisiana—advanced rapidly and the commerce doubled every few years. For the first time in the history of the Mississippi large shipments were made up to the river, and it was through New Orleans and by the river route that the struggling American colonies received through the connivance of the Spanish Government the arms and gunpowder they needed so sorely in the Revolutionary war. The fur trade of New Orleans had reached a high figure by this time, some $100,000 a year, nearly all of it the produce of the trappers in the Northwestern forests. It was from the Mississippi Valley also that Cuba got much of its lumber and a majority of the boxes in which the sugar crop of the island was packed. By 1770 the commerce of New Orleans and the Mississippi Valley had increased to exports of $631,000 a year—mainly furs, skins, indigo, and lumber. New Orleans, which had possessed no commerce worth speaking about before and no merchants—the articles consumed in the colony being obtained mainly from the Government vessels and only so many ships being allowed to enter the river each year—begun to talk of trade and to complain that the British were engrossing the commerce of the Mississippi Valley. In 1778 the merchants of New Orleans, who had grown to be of some importance, were granted special privileges by the Spanish Government on account of the loyalty and courage shown by the Louisiana troops, who had, under Governor Galvez, captured Baton Rouge, Pensacola, and other important points, and driven the British out of West Florida. In return for their courage and loyalty, New Orleans was granted the privilege of sending each year so many ship-loads of goods to France instead of being compelled to ship all its products to Spanish ports.

This marks the opening of the Mississippi to the commerce of the world. Previous to this grant there was no freedom whatever. Under Crozat, under the French and afterwards under the Spanish, the trade was regulated and controlled by the government; the people were not allowed to ship where they wanted to or what they wanted, and no vessel of a foreign power, whether friendly or not, was allowed to enter the river for commercial purposes.

In the meanwhile a settlement was growing up on the Ohio and its tributaries that soon changed the future of the entire Mississippi Valley. When the United States became possessor of the Ohio basin as the legatee of Great Britain the total white popula-

tion of that vast region was only a few thousand, almost wholly of French origin, and engaged more in hunting than in agriculture. About the time that the Revolutionary war opened a new immigration set in from the English colonies on the Atlantic over the Alleghanies into the Valley of the Ohio. The story of Daniel Boone and the settlement of Kentucky, Tennessee, and Ohio has been told already in full. Within twenty years after the first white American was settled in the basin of the Ohio, its population was producing large surplus crops of all kinds and seeking for an outlet by which they could be shipped to market. During the Revolutionary war the United States had stationed an agent in New Orleans for the purchase of guns and ammunition for the Continental forces and their shipment up the river to Pittsburgh and thence overland to Philadelphia. In 1788 the settlers in Kentucky and Tennessee were shipping a large quantity of produce down the Mississippi; and several Philadelphia merchants found it profitable to establish themselves in New Orleans for the purpose of handling this trade, which amounted at that time to some $225,000 a year.

THE RIGHT OF DEPOSIT.

One of the first diplomatic acts of the young Republic was to secure greater facilities for its citizens settled in the Mississippi Valley in the shipment of their surplus crops. Nearly half the country lay in the basin of the Ohio or the Mississippi and dependent on "the Father of Waters" to reach the seaboard. No one at that time, save Washington and a few others, dreamed of sending goods over the Alleghanies by canals or other means; and it was deemed absolutely necessary for the prosperity of the great region lying between the Blue Ridge and the Mississippi that the river should be neutralized as the Suez Canal is to-day and the settlers on its upper tributaries allowed to ship their produce through it without paying toll to the country of Spain, which happened to own its mouth, just as has been done with the Danube. Negotiations to this end were begun with Spain, and in 1795 the treaty of peace between that power and the United States made the Mississippi free to the commerce of the western people, who were given for three years the right of deposit for their produce at New Orleans. If, at the end of three years, Spain desired to fix another place of deposit it was at liberty to do so.

The result of this treaty opening the Mississippi to the commerce of the Western Tertitories had the effect that might have been expected; and the river trade suddenly sprang forward with startling rapidity, and reached what was deemed in those days an immense figure.

It is interesting to note the traffic on it then, so as to see what advance there has been in the past hundred years.

The exports of New Orleans at the time were estimated by an expert, who made a careful examination of the matter, as:

Cotton (200,000 pounds)	$50, 000
Furs	100, 000
Boxes (for sugar, 200,000)	225, 000
Sugar (40,000,000 pounds)	320, 000
Indigo (100,000 pounds)	100, 000
Tobacco (200,000 pounds)	16, 000
Timber	50, 000
Rice (2,000 barrels)	50, 000
Western produce (flour, tobacco, etc.)	500, 000
Total	1, 421, 000

The furs came from the upper country; so did some of the cotton; the sugar, indigo, rice, and timber from the Spanish possessions in Louisiana; the rest from Kentucky and Ohio. In 1798 the receipts of produce from the American settlements on the Ohio reached $975,000, and were increasing some $300,000 a year with the new population pouring into the country. The three years during which New Orleans had been agreed on as the depot for Western produce, according to the treaty between Spain and the United States, had elapsed. The attention of the Spanish Government was called to this, and it was urged by the Kentuckians that if Spain desired to make a change, another point be selected; but nothing was done. It remained for the Spanish intendant, Morales, to interpret the treaty as meaning that with the lapse of these three years the Americans lost all right of deposit at New Orleans or any other point in the Spanish possessions, and that the Lower Mississippi was thus virtually closed to them. It was a fatal decision for Spain, and if Señor Morales had seen the consequence or understood the feeling that his action aroused in Kentucky, Ohio, and Tennessee, he would never have been guilty of it, for his decision lost Louisiana to his government. The neutrality and freedom of the Mississippi became at once the aim of American diplomacy, and the United States was

convinced that the stability of the Government and the commercial necessities of the West required the possession and control of the Mississippi. For the next four years the Mississippi problem and the purchase of Louisiana were the chief subjects of discussion in Congress, and American statesmen at home and abroad worked and intrigued zealously to prevent the Mississippi falling from the hands of a weak power like Spain into those of a strong one like England or France, both of whom had their eyes on this rich, fertile, and productive valley, whose wealth was just beginning to be recognized.

As for the Western people, the Kentuckians and Tennesseeans, they were wild with fury when they heard that their only outlet to market was closed to them by Morales's order. An expedition to New Orleans to capture the city and drive the Spanish out of the Mississippi Valley was seriously discussed. An account was taken of the men available for military service, who were estimated at 20,000, and the preliminary organization begun, when the President sent three regiments to the Ohio to prevent such a filibustering expedition, and assured the people that the matter would be settled by diplomacy. Petitions poured into Congress demanding that it take some action to open the Mississippi to the commerce of the Western Territories. The following, which is one of the petitions presented at the time, gives an idea of the Western sentiment on this subject:

Petition of the people of Kentucky to Congress, 1798.

"The Mississippi is ours by the law of nature; it belongs to us by our numbers and by the labor which we have bestowed upon these spots, which before our arrival were desert and barren. Our innumerable rivers swell it and flow with it into the Gulf of Mexico. Its mouth is the only issue which nature has given to our waters, and we wish to use it for our vessels. We do not prevent the Spanish and French from ascending the river to our towns and villages. We wish, in our turn, to descend it without any interruption to its mouth, to ascend it again, and to exercise our privilege of trading on it and navigating it at our pleasure. If our most entire liberty in this matter is disputed, nothing will prevent our taking possession of the capital (of Louisiana), and when we are once masters of it, we will know how to maintain ourselves there. If Congress refuses us effectual protection, if it forsakes us, we will adopt the measures which our safety requires, even if they endanger the peace of the Union and our connection with the other States. No protection, no allegiance."

There is no doubt that this threat of secession was very popular among some of the pioneers of the West. It must be remembered that the Federal Union was less than ten years old; that the settlers along the Ohio were cut off from the Atlantic sea-coast by mountains through which no roads of any kind ran; that their sole dependence was the Mississippi, and their crops were of no value without the use of that stream.

The Government recognized the justice of these plaints, and Mr. Madison himself, while Secretary of State, in writing to the American minister at Madrid, said of the Western people:

"The Mississippi River to them is everything—it is the Hudson, the Delaware, the Potomac, and all the navigable waters of the Atlantic States formed into one stream."

In the mean while this embargo had caused considerable trouble in New Orleans, where it threatened to create a famine. The lower river country, as to-day, raised articles like indigo, sugar, and cotton, mainly for export, and not enough provisions for the supply of the population. As a consequence of the stoppage of the shipments from the Ohio, there was a dearth of flour and other Western produce in New Orleans.

The discussion over the trade of the Mississippi found its way into Congress, and served as the chief subject of debate.

Mr. Ross, of Pennsylvania, representing the Western element, offered the following resolution:

"*Resolved*, That we have an indisputable right to the free navigation of the river Mississippi and to a convenient place of deposit for the produce of the country and its merchandise in the island of Orleans.

"*Resolved*, That the President be authorized to take immediate possession of the country and to call into service the militia of the Western States."

The difficulty was finally definitely settled by the action of President Jefferson in purchasing Louisiana; and in 1803 the people of the Western States were satisfied by having the Mississippi not only thrown open to them, but actually belonging to the United States of America.

SHIPMENTS FROM THE OHIO.

The increase that had taken place in the population of the Upper Mississippi Valley in two decades is well shown in the shipments from that region to New Orleans during this period of contention.

These shipments were, for 1801, for the districts of Kentucky and Mississippi alone $1,626,672, and for all the American possessions $2,111,672.

In 1802 the shipments from Kentucky alone were $1,182,864, and for the Ohio Valley and that portion of the Mississippi basin possessed by the United States—all from Bayou Manchac up—including all Mississippi and portions of Louisiana and Tennessee, $2,637,564.

Adding what is known of the products of Louisiana, the commerce of the Lower Mississippi Valley, that is the shipments down the Mississippi toward New Orleans, either for consumption in the lower river country or for export, was in the first two years of the present century as follows:

	Value of exports by river.	
	1801.	1802.
American territories:		
Pennsylvania and territory northwest of Ohio	$485,000	$700,000
Kentucky and Tennessee and Mississippi	1,626,672	1,522,064
Mississippi territory	.....	412,500
Spanish possessions:		
Upper Louisiana	115,000	120,000
Lower Louisiana	1,422,650	1,720,800
Total	3,649,322	4,475,364

There are no records of the shipments up the river, but they were small as compared with the down trade, except for the country immediately around New Orleans. The imports at that city about equaled the exports of the Spanish possessions, and included such manufactured articles as could not be obtained in the colony. These were brought to New Orleans from France and Spain, and distributed among the towns and planters by barges, pirogues and plantation boats. Less than 10 per cent. of the imports found their way above Red River.

The shipments from New Orleans consisted of the following articles: 34,500 bales of cotton of an average weight of 300 pounds each, a much smaller bale than to-day; 4,500 hogsheads of sugar of 1,000 pounds each; 800 casks of molasses of 125 gallons each, equal to 2,000 of the barrels used to-day in shipping molasses; 4,000 casks of tafia or rum made from Louisiana molasses, each of 50 gallons; 3,000 pounds of indigo, the cultivation of which had proved a failure in Louisiana, and which was rapidly giving place to sugar; lumber and boxes to the value of $300,000; peltries and skins to the value of $120,000; rice and other miscellanous products to the value of $80,000.

These were the products of Louisiana.

Among the chief articles of Western produce received from the American territory were: 50,000 barrels of flour; 2,000 barrels of pork; 1,200 barrels of beef; 2,400 hogsheads of tobacco; 25,000 bushels of corn. Besides, there were butter, hams, meal, lard, beans, hides, staves, and cordage.

From Pennsylvania, and, indeed, from some portions of Western New York, the woodsman or pioneer of that era loaded his flat-boat with the products of the season and began his voyage down the river to New Orleans. It was a trip of months of danger and exposure, for at least nine-tenths of the distance was wholly uninhabited by whites, and the Indians through all the river country were sullen and hostile. The Ohio Falls were passed with difficulty—generally during the high water—pilots being specially employed for this portion of the route. In the Mississippi itself were snags and dangers innumerable. When New Orleans was reached the produce was sold for, say, $2,000 to $3,000, which was about the average value of a cargo. In the earlier days the land route was seldom followed home, as the Indians held all northern Mississippi; but later this trail was popular, and the flat-boat man returned home across Lake Pontchartrain and thence northward through Nashville—a trail marked to this day. In the first years of the century, however, he generally went by sea to some of the American cities on the Atlantic coast, Baltimore and Philadelphia being the favorites, laid in a supply of calicoes and other manufactured goods there, and got home six months after his departure, just in time to plant another crop.

VESSELS EMPLOYED IN RIVER TRADE.

The vessels employed in the river trade had changed considerably during this period of development, and the rude pirogues and bateaux of the early French settlers had given

place to the flat-boat or Kentucky boat and barge, and afterward to the keel-boats of the Americans. The flat-boat of that day was a small affair, not one-tenth the size it attained half a century later. It averaged nearly 30 tons, and made the trip from Louisville or Cincinnati to New Orleans in 60 days. The professional flat-boat men made but three or four trips a year, selling not only their produce in New Orleans, but their boats as well, when they were broken up for lumber. The cheapness of this means of transportation—for the building of one of these boats cost but $20—made it admirably adapted to the condition of the country at the time. The flat-boat men, after selling out his cargo and boat in New Orleans, and probably having a spree there, returned home by way of Philadelphia, or, at a later day, tramped overland with what money he had left strapped around his waist.

The first boats were built in the Mississippi Valley in 1787, near Pittsburgh, when 30 bateaux, 40 feet long by 9 wide, were constructed for the Government for the transportation of troops and provisions. In 1794 the Government assumed the carriage of the mails between Wheeling and Cincinnati, and for that purpose a line of mail-boats was established, connecting at several points and exchanging mails. These were 24 feet long, built after the manner of a whale-boat and manned by four oarsmen and a coxswain. In going down stream these boats traveled 60 miles a day, but when rowing against the current they made but 30 miles. For cooking and sleeping the mail-boat generally landed at some point off an island where there was less danger of an attack by the Indians, and here the crew made themselves as comfortable as they could under the circumstances. There were four stations between Wheeling and Cincinnati, where the boats met and exchanged mails, the distance between them being accomplished in seven days, up and down, thus requiring twelve days to make the trip up and six down between the two towns. These boats were frequently attacked by the Indians, then dwelling in considerable numbers on the banks of the Ohio, but as the men always went armed and were good shots, the Indians were driven off. This system of transporting the mails was in use until 1798, when improved boats were employed.

The trade of the Lower Mississippi, as will be seen, went almost wholly down stream. There were some few light shipments up the river from New Orleans, but the bulk of the manufactured goods and supplies needed by the settlers on the Ohio were obtained, not through New Orleans, but in the American cities on the Atlantic.

To carry the produce brought from the Western States away from New Orleans there arrived at that port during the year 1802, the last but one of Spanish dominion, 265 vessels of an aggregate of 31,241 tons. These vessels, it is needless to say, were generally small sloops and schooners, the average being under 118 tons each, which would be looked on with contempt to-day. Yet it is gratifying to note that, although the government of Louisiana was in the hands of a European power, alien to the population, not only the Kentuckians, but the Louisiana creoles as well, the outward trade of New Orleans was in the hands of the American merchant marine. Of the vessels arriving there 158 were American, 104 Spanish, and 3 French. The departures for the same year were 258 vessels of 23,725 tons, of which 170 were American, 97 Spanish, and 1 French.

The next year, during which French and Spanish rule came to an end in the Mississippi Valley, saw still greater improvement, the total tonnage entering New Orleans being 42,817 tons, and all of the vessels being filled with Western and Louisiana produce.

The down commerce of the Mississippi during the three first years of the century and the last of European control over the mouth of the great river, was as follows:

Year.	Freight received.	Value of products received.
	Tons.	
1801	38,325	$3,649,322
1802	45,906	4,475,364
1803	49,660	4,720,015

In the latter part of 1803 an event occurred which was destined to completely change the political and commercial future of the Mississippi Valley, and with it the whole history of the river changes.

THE PURCHASE OF LOUISIANA.

On Monday, December 20, 1803, Mr. Laussat, the French commissioner, turned over the province of Louisiana to the American representatives; and the United States became the owner of the entire Mississippi Valley, of which it had formerly possessed

barely a third. The news brought satisfaction everywhere in America. At the last moment the European powers recognized the importance of Louisiana, and the possession of the Mississippi. Napoleon, who arranged the sale for France, expressed great regret that he had to surrender its possession, and predicted that it would make the United States one of the leading powers of the world.

In this country the sentiment which seemed strongest was rejoicing, not over the possession of the land so much as of the Mississippi, the control of its navigation and its outlet. To the western people this was everything. With the millions of acres of public land then owned by the Government, there was no need, and indeed no desire for additional territory. What the people of the West wanted was the Mississippi. Without its possession the settlement and advance of the great interior country must have been slow until some outlet was found to the Atlantic sea-board. With it there was no limit to its development.

President Jefferson himself took the western view of the importance of the Mississippi, and thought its control would change the industrial and commercial condition of this country if not of the whole world. His prediction as to New Orleans, as the port of the Mississippi Valley, was credited by the merchants of that city for years; and indeed it might have proved true but for the discovery of railroads. Writing to his newly appointed governor of Louisiana, Claiborne, the President prophesied as follows:

"New Orleans will be forever, as it is now, the mighty mart of the merchandise brought from more than a thousand rivers, unless prevented by some accident in human affairs. This rapidly increasing city will, in no distant time, leave the emporia of the Eastern World far behind. With Boston, Baltimore, New York, and Philadelphia on the left; Mexico on the right; Havanna in front, and the immense valley of the Mississippi in the rear, no such position for the accumulation and perpetuity of wealth and power ever existed."

If this prediction has not been fully realized in the eighty-odd years that have since passed it must be attributed to that accident which Mr. Jefferson foresaw.

The receipts of produce by the river showed less increase during the first four years of the American dominion than was to be expected.

1804	$4,275,000
1805	4,371,545
1806	4,937,323
1807	5,370,555

The arrivals of sea-going vessels during the latter year were 314, and the departures 350, with a tonnage of 43,220. The keel boats and barges arriving numbered 340, and the departures 11. The flatboat arrivals were estimated at 1,500 but this is probably an exaggeration. Besides these there were in use on the river ocean scows, pirogues, skiffs, and floating lumber rafts.

FLAT-BOATS AND KEEL-BOATS.

The Kentucky boat of that day, in which much of the produce was carried to market, was nicknamed an ark, and the title was most appropriate, as in shape it was much like the ark seen in children's toys. Large oars or paddles were used, not to control or propel the boat, but to partially direct its course. These arks encountered many dangers and difficulties in their trips down the river, and the calculation is that at least one-fourth of them were lost en route. Above the mouth of the Arkansas, where the navigation of the river was worst, and where snags were plentiful, the arks were tied to the shore each night. In the lower river, however, where it was free from obstructions, they floated down as well by night as by day. The large oars were used mainly to keep them clear of the snags and sawyers.

For the transportation of freight up-stream various kinds of boats were used, but none of them can be said to have proved successful, and the tonnage up was barely 10 per cent. of that floating down. The system of rowing up the river and against the current was tried. It was slow, tedious, and expensive. The boats coasted along the shore so as to avoid the full force of the current; but it required one oarsman for every 3,000 pounds of freight, and the work was so tiresome that the men rested every hour. To travel from 14 to 30 miles a day was considered very good work. The river was crossed at the lower end of each bend, and in the crossing the current carried the boat down a half a mile or so. It is said by old boatmen that they were compelled to cross the Mississippi 390 times between New Orleans and Saint Louis. On some of the tributaries of the Mississippi, however, where the current was not so strong, as, for instance, the Ohio, a considerable traffic was carried on up-stream, no less than fifty boats of a tonnage of 30 tons each trafficking between Pittsburgh and Cincinnati and making six trips a year.

The keel-boat was of a long, slender, and elegant form, and generally carried from 15 to 30 tons. Its advantage lay in its small draught of water and in the lightness of its construction. Its propelling power was by oar, sail, setting poles, the cordelle; and when the water was high and the boats ran on the margin of the river, "bushwhacking," or pulling up-stream by the bushes.

The scow was used as a boat of descent for families traveling down the river for settlement, and had a roof or a covering for it. These boats were frequently known as "sheds" in the vernacular. The Alleghany or Mackinaw skiff was a covered skiff carrying from 6 to 10 tons, and much used in the Illinois trade and the upper Mississippi and Missouri. Pirogues were sometimes hollowed from one very large tree or made from the trunks of two trees united and fitted with a plank run. They carried from 1 to 5 tons. There were common skiffs, canoes, and dug-outs for the convenience of crossing the rivers, and a select company of a few travelers often descended in them to New Orleans. Besides these were a number of anomalous water craft that can scarcely be reduced to any class, used as boats of passage or descent, such as flat-boats worked by a wheel driven by cattle being conveyed to the New Orleans market. There were horse-boats of various constructions, used for the most part for ferry-boats, but sometimes as boats of ascent. Two keel-boats were connected by a platform. A pen in the center held the horses, which by a circular movement propelled the wheel. The United States troops frequently ascended the river by boats propelled by tread-wheel, and more than once a boat moved rapidly up-stream by wheel, after steam-boat construction, propelled by a man turning a crank.

But the boats of passage and conveyance most in fashion were the keel-boats and the flats. The flat-boats were called, in the vernacular, Kentucky flats or broad-beams. They were simply an oblong ark, with a roof slightly curved to shed the rain, about 15 feet wide and from 50 to 100 feet long. The timbers of the bottom were massive beams, and they were intended to be of great strength and to carry from 200 to 400 barrels. Great numbers of horses, hogs, and cattle were conveyed to market in them. Family boats of this description, for the descent of families to the lower country, were fitted up comfortably with apartments, and in them ladies, servants, cattle, horses, sheep, dogs, and poultry, all floating in the same bottom and under the same roof, were carried down the river. The largest barges, which were the best boats of these days, resembled a modern canal-boat in appearance. At the stern was the poop-deck, which covered the cabin, and a stand for the patron or captain at the tiller-head. There were two high masts and either hermaphrodite brig or schooner sail rigging. When the barge traveled up river it carried a large crew of from 30 to 40 men, who propelled it against the current, by the use of warnifs, anchors, and cordelles, at the rate of 15 miles a day, using canvas when the wind was fair. The 1,200 miles from New Orleans to the mouth of the Ohio were made in 100 days, and when a barge made it in 96 days it was regarded as very quick time. The price of up freight was 6 and afterwards 5 cents a pound, and there was not much profit in it at these figures. These barges were owned at the Ohio River towns, mainly at Pittsburgh, Wheeling, Marietta, Maysville, Cincinnati, and Louisville. At Marietta several sea-going vessels were built and floated down the river to the Gulf of Mexico.

The flat-boat men were generally Kentuckians or Tennesseeans, and they became to the Louisiana Creoles the type of an American, so that "Kaintock" (Kentuckian) was used as a synonym for American among the native population. They were a sturdy race of men, of splendid physique, indomitable energy and courage, somewhat wild, and ready for a spree when they reached New Orleans.

In those days just above the corporation limits of the town of New Orleans, where land has since formed, and where the wholesale trade of the city is principally carried on, the fleets of barges and flat-boats from the West moored and unloaded or retailed their contents at the water's edge. Farther down and immediately abreast of the town. between the upper limits and the Place d'Armes (now Jackson Square), at what is the sugar and ship landings of to-day, lay the shipping, averaging some 20 or more vessels of from 100 to 200 tons each.

THE TRADE OF THE MISSISSIPPI.

The Western people who shipped their produce down the river via New Orleans had many complaints to make against the tolls and charges at that city, and found that they did not enjoy all those advantages from the possession of the Mississippi which they had expected.

The matter found its way into Congress, where Mr. Poindexter, of the Committee on Ways and Means, inquired into the expediency of prohibiting by law in "the corporation of the city of New Orleans from exacting any tax or duty on vessels, boats, or other craft descending the river Mississippi having on board articles the growth or manufacture of the United States, or such articles of foreign growth or manufacture as have been regularly imported

into the United States." The resolution was carried and the city of New Orleans prohibited from exacting these tolls. A couple of years afterward the legislature of Louisiana, with the same idea that the State had some control of the Mississippi because it lay within Louisiana territory, attempted to give a monopoly of the steam transportation of the river to a company, in which it also was defeated by a ruling of the Supreme Court.

The Western produce trade had grown each year to be a large proportion of the total commerce of New Orleans.

Between October 5, 1810, and May 5, 1811, there passed the Ohio Falls bound down stream to New Orleans, 847 vessels of one kind and another, mainly flat-boats, and the number passing during the season is calculated at 1,200, with the following cargoes:

Articles.	Quantity.	Articles.	Quantity.
Flour.....barrels...	206,855	Butter.....pounds...	41,151
Bacon.....pounds...	1,008,026	Lard.....do.....	775,692
Whisky.....barrels...	15,797	Onions.....barrels...	364
Cider.....do.....	4,193	Potatoes.....do.....	3,019
Pork.....do.....	22,602	Hemp.....cwt...	1,050,492
Apples.....do.....	4,200	Dried fruit.....barrels...	442
Oats.....do.....	6,700	Yarn and cordage.....pounds...	189,020
Corn.....bushels...	79,795	Fowls.....number...	2,012,224
Merchandise.....	$592,640	Shoe thread.....pounds...	4,320

Live hogs.....number....	1,513	Tobacco.....hogsheads...	3,891
Cider, royal.....barrels...	2,250		

These statistics, which were taken by the pilots engaged in piloting the vessels over the Ohio Falls, for three-fifths of the vessels passing that point of danger, and estimated for the remainder, which went over the falls during extreme high-water without a pilot, are in some respects more complete than many made afterwards when statistics of the river trade were much more carefully collected, for the later figures kept no record of the number of fowls, horses, etc., sent down the river.

The list of articles now sent to market gives some idea of the advance and development that has taken place on the Lower Mississsppi with the advent of American rule.

THE STEAM-BOAT.

The result of the transfer of Louisiana to the United States had been to greatly increase the population of the Mississippi Valley, as well as its trade; it was destined to still further change its condition by that great invention of American genius, the use of steam as a means of moving vessels in water. Fulton had tried this with success on the Hudson, and aimed to experiment with it on that greater river, the Mississippi. Great doubts were expressed as to the possibility of navigating it, on account of the velocity of the current, the many eddies and whirlpools, the danger from snags and other obstructions. An agent, Nicholas Roosevelt, was accordingly sent ahead to make a preliminary survey of the river between Pittsburgh and New Orleans, to find whether the obstructions were of a serious character, such as were likely to prevent the passage of a small steamer. He reported that there was nothing to prevent the trip. *The Orleans*, or *New Orleans*, which was under construction at Pittsburgh, was accordingly completed and made ready for the trip in the latter part of 1811. In this first steam-boat the idea of marine architecture was preserved. She was built after the model of a ship, with port-holes on the side, had a long bowsprit, and was painted sky-blue. Her cabin was in the hold.

The steam-boat men of the Mississippi still delight to tell the story of this first cruise of a steamer down the "Father of Waters." The *New Orleans* was built at Pittsburgh in 1811, at a cost of $38,000; was 116 feet long and 20 feet beam, with a 34-inch cylinder, and was a stern-wheeler. The trip commenced in September, with Roosevelt as superintendent, Mrs. Roosevelt—it was regarded as a very hazardous journey for a woman—the captain, engineer, pilot, and a crew of six. All Pittsburgh turned out to bid the boat *bon voyage*, and when it reached Cincinnati on the second night and cast anchor there—for there were no wharf-boats or regular landing then—she was welcomed by the entire population. The *New Orleans* reached Louisville, October 1, when it was found that she could not safely descend the Ohio Falls, as the water was too low. She accordingly returned to Cincinnati, thereby proving that she could go up stream as well as down. In November, the river having risen, the *New Orleans* safely crossed the falls.

She entered the Mississippi just about the time of the New Madrid earthquake, and arrived at Natchez in December, where she took on her first freight and passengers—she had been built for the Natchez and New Orleans trade—and arrived at New Orleans on the day before Christmas, 1811. The *New Orleans* at once regularly entered the Natchez trade, and, until she was sunk by striking a snag in the winter of 1814, ran regularly between the two places, making a great deal of money for her owners. On her first year's business she cleared $20,000 net—not bad on an investment of $38,000. Natchez at that time was the great depot on the Mississippi for the overland trade from the North and East.

In Kramer's Almanac in 1813 is given a letter describing a trip up the river on the *New Orleans*, in which it is said:

"The present boat does business to real advantage, and is owned by Fulton & Livingston, of New York. She performs a regular route from Natchez to New Orleans in three days, and returns in four. The passage descending is $18, and ascending $25. I descended in the boat in March, 1812, in thirty-two hours."

The first experiment with steam in the navigation of the Western rivers created surprise and excitement, but it did not give complete satisfaction. The truth is that it was neither a perfect success, nor yet a failure. The growing commerce of the river demanded something better than the flat-boats and barges, and the merchants and mechanics of the valley having the necessary means and animated by the spirit of enterprise, did not hesitate to continue to experiment in the hope of finally solving the problem of steam navigation up the Mississippi and its tributaries. The experimental period lasted for five years. In that time nine expensive steam-boats were built, and while each succeeding boat was a decided advance on that which preceded it, defects and improvements being suggested by practical experience, steam navigation was not regarded as an assured success until 1817, when the steam-boat *Washington* made the trip from New Orleans to Louisville in twenty-five days. The trouble all along had been to stem the current successfully, and this trouble the indomitable pluck and energy of the merchants and the skill of the mechanics finally accomplished. With 1817, therefore, may be said to begin the era of successful steam navigation on the Mississippi.

The difficulty of vessels stemming the current of the river induced those who were interested in steam navigation to suggest a system of relays such as Fulton and Livingston had originally designed, the river being divided up into sections. Then one boat was to run from Pittsburgh to Cincinnati, another from Cincinnati to Louisville, a third from Louisville to Smithland, a fourth from Smithland to Natchez, and another from Natchez to New Orleans, the passengers and freight to be transferred at each point. This ingenious plan of continually loading and unloading was never carried out, for before it had been perfected the problem of stemming the current was solved. The *Washington*, to which this solution is due, was the sixth boat built on the Mississippi River. She was a high-pressure steamer, with four single-flue boilers, and was built at Wheeling in 1816. She left there July 5 and arrived in New Orleans October 17, 1816. It was on her return trip to Louisville that she demonstrated very clearly the possibility of ascending the river with steam. The trip of the *Washington* to Louisville was by far the most rapid made, up to that day. The following is her record: Left New Orleans, March 24; reached Natchez, March 29; reached mouth of Arkansas River, April 5; reached Chickasaw Bluff (Memphis), April 7; reached New Madrid, April 10; reached mouth of Ohio River, April 11; reached Falls of Ohio (Louisville), April 17.

The trip of the *Washington* established another point of the very greatest advantage to the river country—that the Mississippi was the heritage of the people and could not be monopolized by any one. A company had been formed at the head of which were Fulton and Livingston, who had made the first experiments with steam on the Ohio and Mississippi. This company obtained from the Louisiana legislature an act giving them the exclusive right of navigating the waters of Louisiana with steam-vessels for fourteen years, with the privilege of renewing their charter at the end of that time. Any one violating this monopoly was subject to a fine of $500. The company owned the *Ætna*, *Vesuvius*, and *Orleans*, and had arranged for a system of transfers at Louisville. The trip of the *Washington* to New Orleans was in defiance of this law, and that steam-boat was accordingly seized when she arrived at "the Crescent City." The United States court swept away the monopoly, declared that the river was the heritage of the whole people, that the State of Louisiana could not control it and give its navigation to any company or monopoly. This decision naturally gave a great impetus to steam-boat building, and the next few years saw all the Ohio towns turning out steam-boats.

In the mean while, however, several other steam-boats had been built. The *Comet* was constructed at Pittsburgh in 1813, 52 feet long and 8 feet beam, with 50 to 60 pounds of steam per inch, and 20 to 30 strokes a minute. At the end of 1813, there were, according to Kramer's Almanac, eleven steam-boats in the whole country, three building about Pittsburgh to complete the line between that town and New Orleans, and one small

boat to carry wheat and corn on the Monongahela. The closing career of the *New Orleans* was in carrying re-enforcements and munitions to Jackson's army, just before the battle of New Orleans. In 1814, three years after her construction, the *New Orleans* was sunk by a snag. She was tied to the bank at night. The river fell, and in the morning, it was found that the boat was snagged.

Following the *Comet* came the *Vesuvius*, built at Pittsburgh in April, 1814, by Robert Fulton. She was of 480 tons burden, and made the trip to Louisville, 767 miles, in sixty-seven hours, from Louisville to Natchez in one hundred and twenty-five hours, and from Natchez to New Orleans in thirty-three, making the whole distance in two hundred and twenty-seven hours, or 9½ miles an hour, not bad speed when the circumstances are considered. The *Vesuvius* also figured at the battle of New Orleans.

In 1814 the fourth steam-boat on the Mississippi, the *Enterprise*, was built at Brownsville, reaching New Orleans the latter part of December, just in time to be pressed into service at the battle of New Orleans. The *Enterprise* was the first boat to reach Cincinnati from New Orleans, getting there in 1815, in twenty-eight days. She was a small vessel of only 35 tons. Some idea of the times is given by the fact, that the price of passage on this boat from New Orleans to Cincinnati was $130, and from Cincinnati to Pittsburgh $30.

The following is the order in which the original steam-boats landed at the port of New Orleans, taken from an old wharfage book in the archives of the city:

New Orleans, January 12, 1812, Captain Baker.
Vesuvius, May 16, 1814, Capt. John De Hart.
Enterprise, December 14, 1814, Capt. H. M. Shreve.
Etna, April 24, 1815, Capt. R. De Hart.
Dispatch, February 13, 1816.
General Pike, October 2, 1816, Capt. Benjamin Booth.
Washington, October 7, 1816, Capt. Henry M. Shreve.
Franklin, February 10, 1817, Capt. E. Young.
Constitution, April 17, 1817, Capt. R. P. Guiard.
Harriett, May 6, 1817, Capt. I. Armitage.
Buffalo, May 6, 1817, Capt. S. Clough.
Kentucky, November 14, 1817, Capt. B. Bosworth.
James Monroe, November 26, 1817, Capt. J. A. Palfrey.
George Madison, January 1, 1818, Capt. J. A. Holton.
Vesta, January 24, 1818, Capt. J. Shackleford.
Governor Shelby, March 23, 1818, Capt. John T. Gray.
General Jackson, April 1, 1818, Capt. D. Whiting.
Cincinnati, May 23, 1818, Capt. C. Paxon.
Ohio, June 9, 1818, Capt. H. M. Shreve.
Napoleon, June 19, 1818, Capt. J. Gregg.
Eagle, June 19, 1818, Capt. N. Berthoud.

RIVER TRAFFIC.

The river traffic of 1814 shows that the steam-boats had so far made but little impression. Transportation by steam-boat was still an experiment. There arrived at New Orleans that year:

	Number.	Tonnage.
Flatboats	598	88,350
Barges	324	
Steam-boats	21	2,098

These steam-boats were three in number, the *New Orleans*, *Vesuvius*, and *Enterprise*. The steam-boat tonnage of New Orleans was but little over 2 per cent. of the total.

The sea-going vessels, leaving New Orleans that year, numbered 351, of 81,180 tons, as follows: Ships, 188; brigs, 95; schooners, 52.

The principal products received from the interior were as follows:

Articles.	Quantity.	Articles.	Quantity.
Cotton.....bales...	58,220	Pork.....barrels...	7,226
Corn.....bushels...	116,872	Rice.....do.....	7,500
Flour.....barrels...	73,820	Tafia.....gallons...	142,800
Sugar.....hogsheads...	11,640	Tobacco.....hogsheads...	6,210
Molasses.....gallons...	482,500	Whisky.....barrels...	16,200

In 1815 still another steamer, the *Buffalo*, was built at Pittsburgh, which Livingston and Fulton proposed to run to the Falls of the Ohio, where she could connect with their large steamer *Vesuvius*, from New Orleans.

A curious fact, in regard to the river and its tributaries at this time, is, that the navigable streams are estimated as of so much greater extent than to-day. Notwithstanding the fact that the Federal Government has been at work improving many of them, the mileage considered opened to navigation in the year 1816 was much greater then, than now. In a book published at this time the total extent of rivers tributary to the Mississippi, entirely within the area of Louisiana, is estimated at 5,762 miles, double what it is to-day. Indiana is put down for 2,487 miles of tributary streams, Illinois 3,094, Kentucky 2,487, and Mississippi 2,902, a total for these five States of 13,732 miles of navigation, whereas, they are estimated to-day, as possessing only 7,650 miles. Streams never used by vessels now were then regarded as navigable because, during certain seasons of high water they were able to float flatboats out to the main river, the produce being thus carried to market.

The return trade, that is a supply of the articles of European make, still came principally by way of the East from New York, Philadelphia, and Baltimore overland from Pittsburgh. Nor did the discovery of steam as a motive power for river boats cause much change. New Orleans increased its shipments up the river when a better means of stemming the current was discovered, but the bulk of its shipments were cheap and heavy products. The Southern States received supplies of Western produce, pork, grain, flour, etc.; the Western towns, like Cincinnati and Saint Louis, coffee, sugar, etc. The trade in dress goods, and the finer manufactured articles was mainly with the East. Thanks to steam-boats, however, the business of New Orleans in this direction, although much less than it ought to be, considering its receipts of produce, showed great increase, and one singular fact is observable in this trade, showing how much influence the origin of a people will have upon their commerce. With the exception of some Philadelphians, who established themselves in New Orleans just before the purchase of Louisiana, a majority of its merchants, particularly the importers, were Creole or French, who preferred to get their goods, from France rather than from England. As a result, the Kentuckians and Tennesseans of seventy years ago were supplied from New Orleans, mainly, with French print, broadcloths, and other dress goods, whereas the bulk of the people on the Atlantic wore almost wholly the produce of British looms. The early French influence made itself felt throughout the Lower Mississippi Valley until about the time of the outbreak of the war, and in many portions of the river country the demand was for French rather than English goods.

IMMIGRATION INTO THE MISSISSIPPI VALLEY.

It was just about the time of the discovery of steam as a motive power for steam-boats that a new tide of immigration started from the Atlantic coast to the river country. There had been a rapid growth of the population of the valley from the date of the purchase of Louisiana, but between 1810 and 1820 that movement received a new impetus—probably due to the war of 1812. This movement went down the Ohio and into all the region tributary to it and to the Mississippi, both the upper and the lower portions. The immigrant guide-books of those days—of which there were many—declare the river route preferable, as being cheaper, more rapid, and more satisfactory than traveling across the country where there were few, if any, roads. The river bottoms both of the Ohio and Mississippi Rivers were then regarded as very unhealthy and dangerous sections, and the immigrant was advised not to start on his trip until in the fall, after the frosts had killed the malaria. The guide-books describe the rivers as being very unpleasant during the summer season, with offensive odors coming from the shores. The immigrants were also warned against drinking river water before filtering or boiling it. On flat-boats and on pine rafts, the latter being deemed the better plan, thousands of settlers drifted down the rivers each year, and in the short space of a decade the population of the Mississippi Valley doubled.

RECEIPTS OF PRODUCE.

The receipts of New Orleans during the first year of successful steam navigation, 1816, amounted in value to $8,062,540. The character of produce received will furnish an excellent comparison for subsequent years by showing the lines of goods in which a trade was developed.

Besides horned cattle, indigo, muskets, grindstones, pecan nuts, and beans.

This is independent of the produce raised in Louisiana, such as cotton, corn, indigo, molasses, rice, sugar, tafia or rum, and lumber. These were brought to the market in the planters' crafts, and often taken from the plantation direct in foreign-bound vessels, a ship loading directly with sugar and molasses, which thus never went through New Orleans. But little account was taken of this system in the commercial reports of the time, although sea-going vessels ascended the river as far as Natchez for cargoes. They were, of course, of small size, of but little more tonnage and draught than the steam-boats themselves.

The value of receipts shows to what extent the produce of the West passed through New Orleans. Cotton, which in later days rose to be 60 and even 75 per cent. in value of all the receipts, was then barely 12 per cent. At least 80 per cent. of the articles came from the West, that is, from the Ohio and the Upper Mississippi, above the Ohio. They represented the surplus products of the Mississippi Valley, for but little found any other exit to market. Much of the produce shipped from the West to New Orleans was lost en route. A rough estimate places the loss from disasters, snags, etc., at 20 per cent. Many boats, moreover, stopped along the river on their way down to sell supplies to the planters. Thus, at Natchez, flour, grain, and pork were purchased from the Kentucky boats.

From these losses and sales the shipments down the river in 1816, including the products of Louisiana, may be estimated at $13,875,000.

The river traffic required 6 steam-boats, 594 barges, and 1,287 flat-boats, of a total tonnage of 87,670.

The effect of the use of steam-boats in the river trade was soon seen in a large increase in the shipments of produce. The value of the receipts at New Orleans shows the following advance in the next half-dozen years:

Value of produce received at New Orleans from the interior.

Years.	Amount.	Years.	Amount.
1815–'16	$9,749,253	1818–'19	$16,771,711
1816–'17	8,773,379	1819–'20	12,637,079
1817–'18	13,501,036	1820–'21	11,967,067

From 1802 the down commerce of the lower river had grown in 1818, sixteen years, more than fourfold. The trade up the river during the same period had been multiplied threefold.

The year succeeding the introduction of steam-boats, 1817, New Orleans chronicled a large increase in its receipts of produce, as follows:

Articles.	Quantity.	Articles.	Quantity.
Cotton.....bales...	59,826	Tafia (rum).....gallons...	18,600
Sugar.....hogsheads...	10,642	Beer.....barrels...	826
Molasses.....gallons...	486,320	Cider.....do.....	925
Tobacco.....hogsheads...	7,412	Apples.....do.....	562
Do.....carrots...	9,862	Potatoes.....do.....	5,642
Flour.....barrels...	95,325	Lard.....pounds...	256,600
Rice.....do.....	9,320	Soap.....boxes...	9,860
Beans.....do.....	3,896	Candles.....do.....	2,200
Beef.....do.....	5,122	Castings.....kettles, etc...	226,000
Pork.....do.....	4,382	Lead.....cwts...	6,213
Bacon.....pounds...	713,382	Bark.....cords...	4,000
Bagging.....pieces...	9,825	Tar.....barrels...	6,580
Whisky.....gallons...	262,328	Pitch.....do.....	3,263
Gin.....do.....	50,250	Hogs.....number...	1,227

The receipts for the following year show an improvement in nearly all lines, and a greater variety in the class of articles received, or at least noticed, for in these first commercial reports many products were altogether overlooked:

Articles.	Quantity.	Articles.	Quantity.
Beans.....barrels...	3,643	Lard.....cwts...	6,738
Cotton.....bales...	65,223	Molasses.....gallons...	1,126,500

This includes, it will be seen, the produce of Louisiana as well as that of the upper country. The Louisiana products amount in value to 28 per cent. of the whole. Of the remainder, fully 61 per cent. come from what is known as the West. In the last few days of Spanish rule in Louisiana over 40 per cent. in value of the receipts at New Orleans had come from that colony. The West was rapidly increasing in population, and New Orleans was securing all the new trade thus opened. It was as much a Western as a Southern city, and as many of its American population—to distinguish the new-comers from the creole natives—were of Western or of Southern origin.

The commerce of the upper States was monopolized by the Americans. Indeed, before the colony was purchased by the United States a large proportion of the merchants of New Orleans were citizens of that country. The first American merchants had come from Philadelphia, and the commercial interests of New Orleans and the Mississippi Valley were in consequence more closely allied for years with "the Quaker City."

STEAM-BOAT BUILDING.

From the day that the problem of successful steam navigation not only down the stream with the current, but up stream, was solved by the *Washington*, steam-boat building was actively carried on, and new steamers were added each year to the river fleet.

In 1816 there arrived at New Orleans the *Dispatch*, of 90 tons, the *Washington*, of 412 tons, the *Franklin*, of 131 tons, and the *Constitution*, of 112 tons.

In 1817 there arrived the *Harriet*, of 54 tons, *Buffalo*, of 249 tons, *Kentucky*, of 112 tons, *James Monroe*, of 140 tons, *James Madison*, of 148 tons, *Vesta*, of 203 tons, and the *Governor Shelby*, of 106 tons.

In 1818 the *General Jackson*, 142 tons, *Pike*, 51 tons, *Cincinnati*, 157 tons, *Napoleon*, 315 tons, *Eagle*, 118 tons, *Newport*, 59 tons, *Hecla*, 124 tons, *Johnson*, 140 tons, *Exchange*, 212 tons, *James Ross*, 269 tons, *Ramapoe*, 146 tons, *Tammerlane*, 214 tons, *Maysville*, 209 tons, *Maid of Orleans*, 193 tons, a total for the year of 14 new boats, with an aggregate tonnage of 2,347 tons.

In 1819 there arrived the *Ohio*, *Volcano*, *Alabama*, *Rifleman*, *Rising States*, *St. Louis*, *Paragon*, *Mobile*, *General Clark*, *Yankee*, averaging 150 tons each.

In 1820 the *Feliciana*, *Frankfort*, *Car of Commerce*, *Vulcan*, *General Roberts*, *Tennessee*, *Comet*, *Hornet*, *United States*, *Columbus*, *General Green*, *Missouri*, *Elizabeth*, *Beaver Rapids*, *Fayette*, *Cumberland*, *Arkansas*, and the *Independence*, 19 boats, whose tonnage aggregated 2,850 tons.

In 1821 there arrived the *Manhattan*, *Mars*, *Velocipede*, *Olive Branch*, *Hero*, *Dolphin*, *Osage*, *Telegraph*, *Rapides*, *Post-Boy*, *Alexandria*, *Courier*, *Columbus*, *President*, *Rocket*, *General Green*, *Elizabeth*, 17 boats, tonnage 2,550 tons.

In 1822, *Henry Clay*, *Rifleman*, *Neptune*, *Favorite*, *Expedition*, *Mandan*, *Nashville*, *Providence*, *Teche*, *Robert Thompson*, *Indiana*, 11 boats, 1,540 tons.

And in 1823 the *Leopard*, *Calhoun*, *General Pike*, *Congress*, *Hope*, *Fidelity*, and the *Robert Ray*, 7 boats, with a total tonnage of 1,050 tons.

Almost all of these first boats upon the Western waters were designated as "low pressure." This was a misnomer; they had merely non-condensing engines, exhausting the steam into the air, although they were provided with condensers. Very few of the boats built for the Mississippi River had walking-beams. They had what is called steeple engines, the cylinder being placed vertical; the piston was attached to a beam of iron running crosswise, something on the style of an old saw-mill engine. Some of the boats were provided with horizontal cylinders, like those of the low-pressure *Richmond;* these engines seldom made more than 15 or 20 pounds of steam, from the fact that they could obtain only a partial vacuum. All of these original engines were built on the Watt & Bolton plan; several were imported from England. The *United States* had two walking-beam engines, and was probably the first steam-boat to have two engines. The *New Orleans*, *Vesuvius*, *Ætna*, *Buffalo*, *Ramapo*, *Fanny*, *Feliciana*, and the *Natchez* had the Watt & Bolton engine.

The first high-pressure engine was built in 1813, by French, at Brownsville, Pa., and was placed on the *Comet*. It was an oscillating engine, but not working well, was taken out and placed in saw-mill at Natchez in 1814. Afterwards French put his engines on the *Enterprise*, Capt. H. M. Shreve, the first boat to enter Red River, and the *Dispatch*.

The first regular high-pressure boat was the *Washington*, built for Captain Shreve, in 1816, at Wheeling. She had one horizontal cylinder 24 inches in diameter, 6-foot stroke, four single-flue boilers. The cut-offcam invented by Captain Shreve was first used on this boat.

The steamer *Ramapo* was built in New York in 1820. She was originally a schooner of 146 tons burden. She had a low-pressure engine, and was the first boat to run between New Orleans and Baton Rouge. The *Manhattan*, of 426 tons, was built also in New York, and had low-pressure engines. She ran for several years between New Orleans and Louisville. The *Feliciana*, 407 tons, low-pressure, was built in Philadelphia and was the first regular packet to Bayou Sara. In 1821 the *Mobile*, 145 tons, low-pressure, was built at Amesbury, Mass., to run between New Orleans and Mobile. The *United States*, 645 tons, was built at New Albany. She was floated to this city for her machinery, which had been received from England. She was the wonder of her day, and was called *The Mammoth*. She was not a paying investment, owing to her complicated machinery. The *Car of Commerce*, 221 tons, was built at Freeport, Pa. She was considered remarkable in her day, having made the run to Shawneetown in twelve days. The *Henry Clay*, built at Newport, Ky., and the *Paragon*, built at Cincinnati, were also fast, making Louisville in sixteen days. The *Mississippi*, 372 tons, was built at Blakely, Ala., in 1820. Capt. H. S. Buckner was her commander. Finding her too heavy and unwieldy for the lake trade, Captain Buckner brought her around and ran her to points on the Mississippi.

Besides the above boats mentioned, there was built the *Eclipse*, *Phœnix*, *Florence*, *Scioto*, *Pennsylvania*, *Andrew Jackson*, *Fanny*, *Caledonia*, *Fidelity*, *Mars*, *Leopard*, *Belle Creole*, *Swan*, *Superior*, *Venture*, *Natchez*, *Robert Fulton*, *Balize*, *Spartan*, *Magnet*, *Steubenville*, *Missouri*, *Rambler*, *General Pike*, *Fayette*, *Rob Roy*, *Paul Chase*, *Robert Emmet*, *Belvidere*, *George Washington*, *William Penn*, *Bolivar*, *Congress*, *General Wayne*, *Tecumseh*, *Paul Jones*, *Tuscumbia*, *Philadelphia*, *Hibernia*, *Hercules*, *Commerce*, *Aerial*, *Liberator*, *Planter*, *Helen McGregor*, *Post Boy*, *Marietta*, *Louisville*, *Columbia*, *Huntress*, *General Coffee*, *Virginia*, *Ontario*, *Decatur*, *Lexington*, *Messenger*, *Governor Hamilton*, *Dolphin*, *Patriot*, *Emerald*. The *Fanny* was a schooner propelled by steam. The *Natchez* was built at New York. Capt. H. S. Buckner bought and run her to Natchez. She made the run there in three days. The *Hercules* and *Post Boy* were tow-boats between New Orleans and the Balize.

The three packet-boats were the *Paul Jones*, *Tecumseh*, and *Philadelphia*. They were single-engine boats, and their time to Louisville was twelve days.

In 1821 there arrived at New Orleans—

287 steam-boats of a tonnage of	54,120
And flat-boats, barges, etc., of a tonnage of	52,750

This made the total river tonnage 106,870. The barges and flat-boats had fallen off both in numbers and tonnage, and the steam-boats were in a lead that they have since kept.

Within a decade the steam-boat had firmly established itself on the river and was an acknowledged success.

The Louisiana Advertiser speaks as follows on the subject in 1823:

"It is now nine years since the first steam-boat was evolved at the port of New Orleans, since which period up to the present time eighty-nine different steam-boats have been evolved at this port. The first boat was lost in 1814, and up to the present time there have been twenty-three other boats lost, either by sinking, destroyed by fire, decayed, or condemned, forming in the aggregate about 4,000 tons, and leaving a balance, say, of 14,000 tons. This 14,000 tons does not employ more than 1,000 men and can do more in a given time than 50,000 tons could have done in barges, keel-boats, or any other kind of vessels employed ten years ago with 20,000 hands. The rapid increase of steam-boats had very soon the natural tendancy of reducing freights, and, although the owners suffer severely from this cause in the consequent diminution in the value of the vessels, yet the country at large has been greatly benefited by their introduction, and it is to be hoped the number in existence can be more beneficially employed."

The amount of products that descended the Ohio during this time was estimated at 68,932 tons.

Of the goods that went down the Lower Mississippi, one-half came from the Ohio and its tributaries. Indeed, up to this time the settlements in the West and South had been restricted mainly to the Ohio basin, and comparatively few persons had yet established themselves on the Lower or Upper Mississippi, or on the Missouri, Arkansas, White, or other tributaries on the west.

The first engineers of the steam-boats came from England, New York, and Philadelphia. Very few of them had a theoretical idea of steam; about the only thing they knew was that they had a safety-valve with a weight upon it, indicating so many pounds pressure of steam. They also knew that the water should be kept at a certain depth in the boilers.

When any of these boats raced, the engineers placed extra weights on the safety-valves, and really could not tell in many instances within a hundred of the amount of steam they were carrying. Within the last thirty years all this has changed, as engineers then commenced to receive both a theoretical and practical education of their calling. The first invention to guard against explosion was the Evans safety guard. This invention has been so improved that an explosion has become a rare exception.

The pilots of those days were the keel and barge men. They knew from a hard-earned experience the sand-bars, islands, and many of the worst obstructions in the river. In those days they did not run the river much at night, the danger from snags and sawyers being too great. They were a hardy, fearless set of men, whose former life had forced them to face every danger and to stand up against fatigue.

The captains were chosen mostly from the seafaring class, because they were thought to have greater command of the men under them.

It can not, however, be said that they were a success or proved themselves equal to the emergencies of the river. There was a decided disposition in the early days of river navigation to follow too closely the habit of the sea, and to pretend that the Mississippi was an interior ocean. The captains, for instance, having been accustomed when at sea to issue their orders through a trumpet, necessary there, to make them heard in the roar of the waves and the storm, still insisted upon using the trumpet upon the quiet waters of the Mississippi, and shouted stentoriously through the trumpet at their mates but a few feet distant with all the worst nautical oaths and expressions. It was not until years afterwards that the simple process of giving orders by means of bells was adopted.

The boats, too, had a marine build. The *New Orleans* was simply an ocean vessel transferred to river use; and for years bowsprits and figure-heads were universal on the river. All the first boats had their cabins on deck, aft of the engine, the ladies' cabin being in the hold aft.

The boats were small compared to those which now do the carrying trade of Western rivers. Indeed, there does not seem to have been a very great increase in their size for many years. It is mentioned by reliable authority that as late as 1846 the smallest boats were about 120 tons burden, and the largest, not more than 500 tons. The largest boats now are from 2,500 to 3,000 tons burden. Although the increase in the size of boats was slow, great pains were taken to make them attractive to passengers. The travel on the river was then very large and profitable, and it became necessary to cater to the wants of the traveling public. The saloons were elegantly furnished, and the table was provided with every delicacy which the season and the market afforded.

The accommodations and comforts of the boats of a quarter of a century and more, ago are still remembered, and spoken of in glowing terms. They were no doubt very superior for those times, but they were hardly equal to those of the boats of the present day. The wants of the traveling public are greater now than then and their tastes more luxurious.

It is somewhat strange to hear the papers talk of the great cheapening of freights caused by the first steam-boats, when we learn that the rates from points above to New Orleans in 1819 was 3 cents a pound; a few years previous they had ranged from 4 to 6 cents. Passage by steam-boat from Louisville to New Orleans was $100 when money was worth twice what it is to-day. Deck passage was $18, but the economical passenger could make it less by helping to wood the boat at the wood-yards scattered along the bank.

The flat-boats on the river increased in size with the steam-boats. About four-fifths of them reached New Orleans, the others being lost en route or selling out at some way town. The hay flat-boats of Indiana of 1820–'26 were 50 feet long, 16 wide, and carried about 30 tons of hay, ranging in price from $15 to $30. In 1832–'33 the size of these boats began to increase; one, 90 feet long and 18 wide, carrying 102 tons, cost $170 to build. They finally reached the size of 150 feet long by 24 wide, carrying 300 tons of produce. Flatboats, when run to New Orleans for years, were broken up and houses built of them, the gunwales being cut up, and the streets and sidewalks paved with them. Some time between 1855 and 1860 the boats began to be towed back from all the ports along the river, especially the coal-boats and coal-barges. The empty boats sold in New Orleans for from $30 to $200, increasing in price from $30 up to $200 in 1861, when the war stopped flat-boating. The price of hands to go down on flat-boats from Aurora to New Orleans was $10 to $30 per trip, the pilots usually receiving from $50 to $200. This was the price from the commencement of boating to the commencement of the war.

In the early days of boating, boatmen received gold and silver for their produce. Later, they received gold, silver, and United States paper, and in bringing home their gold and silver they messed together and put their money in a barrel, and one stood watch over it at a time, day and night, on the deck of a steam-boat, as nearly all boatmen traveled "on deck."

We have fortunately very full statistics of the commerce of the lower river during this period, although, for some reason or other, the Louisiana products were not generally included in the reports, possibly because they reached New Orleans by all sorts of routes, by wagon, boat, pirogue, and skiffs. For the five years from 1822 to 1826 the receipts of produce at New Orleans by river were:

Nearly half the cotton, all the tobacco, and most of the provisions came through the Ohio. The Upper Mississippi furnished most of the furs and skins, the lead, etc.; the Lower Mississippi, cotton, sugar, molasses, etc.

Of these products, the majority came from the Ohio basin, then the most thickly settled part of the Mississippi Valley. Taking the period 1822–'26 as a basis, the following would be about the proportion of the traffic enjoyed by the several districts constituting the great valley:

Ohio basin	49
Upper Mississippi	9
Lower Mississippi	42

These dry statistics tell the story of the settlement of the Mississippi Valley, its civilization, development, and advance, and the commercial changes that have taken place in it. The deer-skins, the venison hams, the bear oil, peltries, and furs, which form so important an article in the early receipts, soon disappear to give place to agricultural and afterwards to manufactured products. During the days of the French dominion the most important exports of the valley were the produce of the chase. Next came rough lumber for the manufacture of sugar boxes for Cuba; then raw agricultural products; afterwards articles like pork, flour, and others that required some process of treatment. As yet the manufactured articles exported were few, being of the simplest character, such as bagging, rope, twine, candles.

THE RIVER TOWNS.

At this date the most important lines of trade, those requiring the most vessels, were with Nashville, Bayou La Fourche, Natchez, and Louisville. Natchez was a more important river point than Vicksburg, being the center of a populous district, and gave employment to three times as many steam-boats. Nashville, as the center of the rich tobacco country of Tennessee and Kentucky, sent more steam-boats to New Orleans than any town in that section. On the Ohio, Louisville was the most important point, very few steamers ascending higher on account of the falls. If a steamer went above Louisville she generally continued up to Pittsburgh.

The Saint Louis and Upper Mississippi River trade with New Orleans was as yet insignificant, but few persons having penetrated into that region. On the Tennessee River boats ran as high as Florence, but when the water rose flat-boats poured out by the hundred, laden with the cotton of north Alabama and the tobacco of Tennessee.

On the Mississippi the other most important shipping points besides Natchez were Bayou Sara and Baton Rouge. Vessels ran up the Ouachita, but no higher up the Red than Natchitoches, on account of the raft.

The flat-boats came from all the upper country. The great majority of them were from the Ohio and its tributary. The Cumberland and Tennessee sent out hundreds laden with cotton and tobacco, the Ohio proper with apples, corn, flour, coal, etc. A majority of the flats at this time were from the Southern States, but this soon changed, and Indiana and Ohio were in the lead. The flat-boat traffic, except that of the districts immediately around New Orleans, was confined to a few months of the year. The boats waited for a rise in the river and came down with the high water. During January and February two-thirds of the flats arrived in New Orleans, as many as 75 in a single week. The flat-boats were cheaply made, and were broken up and sold for lumber in the city. Keel boats were going rapidly out of favor. The up freight of the river was much smaller than that down, and the steam-boats could easily handle all of it; hence the keel boats were superfluous and were no longer needed to carry freight up the country. A few still ran in the rivers of Arkansas and some of the States west of the Mississippi, but they were disappearing. The bateaux were altogether gone, save in the very wildest and most rugged portions of the Indian country, and but few of these arrived at New Orleans, with their cargoes of deer and bear skins. The market-boats were of the flat-boat order, dropping down the river from point to point, and trading, selling the planters and farmers Western provisions or trading it off for cotton and the products of the country.

The sugar, rice, etc., of the country immediately around New Orleans was brought to the city in pirogues, skiffs, or boats made from solid logs. Each planter had his boat, and although it was small he could send his crop to market in it—a few hogsheads or bales at a time. But little record was kept of these arrivals at New Orleans, and hence the earlier records, while showing accurately how much corn, beef, and other produce of the upper Mississippi Valley was received, gave no record whatever of the receipts of Louisiana sugar, molasses, or rice. A striking incident of the river commerce of those days was the large number of sailing vessels, sloops, schooners, and afterwards luggers, engaged in it. Nearly all the produce of the country below New Orleans was brought to the city in

this way; and the sailing vessels ran even as high as Natchez, bringing down cotton and sugar from "the upper coast."

In 1825, nine years after the success of the steam-boat, it had passed all competitors, and the greater portion of the produce of the lower Mississippi Valley was brought to market in it. In 1826, 57 per cent. of the freight was carried to New Orleans by the steam-boats and only 43 per cent. by other means.

The following arrivals during the season 1825–'26 (the commercial year then began in New Orleans and throughout the South October 1; it has since been changed to September 1) gives some idea of the variety of crafts employed upon the river:

Arrivals in 1825–'26.

Class.	Number.	Class.	Number.
Steam-boats	715	Market boats	41
Flat-boats	981	Batteaux	3
Keel-boats	57		
Schooners and sloops	108	Total	2,006
Pirogues	101		

While the steam-boats had greatly increased in number, threefold in four years, it will be seen that they had not yet driven out the flat-boat. Quite the contrary. The flat-boats also had increased largely. On the other hand, there was a material falling off in the number of keel-boats in use. The flat-boats were cheap, offered a cheap means of carrying bulky freight to market, and, moreover, they carried out a great deal of produce from the smaller streams where the steam-boats could not go or where they did not care to take the risk of snags and sawyers.

The average tonnage of the river vessels in 1831 was 240 tons, and of the sea-going vessels running from New Orleans, 437. The steam-boats, however, were constantly and rapidly increasing in size, whereas the sea-going vessels increased more slowly, so that in 1845 the two were about the same tonnage, and a ship could carry away from New Orleans just the cargo that one steam-boat could bring there.

LOSSES ON THE RIVER.

From the very start the steam-boats had met with many disasters. The sixth boat built for the river traffic, constructed at Brownsville in 1815, ran aground on her way down the river and burst her boiler—a disaster by which ten or twelve lives were lost.

Even more disastrous were the snags with which both the Ohio and the Mississippi were filled. An appeal was made to Congress in 1820 to remove them, but it declined to take any action.

From 1822 to 1827 the loss in the Ohio and Mississippi Rivers by snags alone, including steam and flat-boats and their cargoes, amounted to $1,362,500. From 1827 to 1832, when quite a number of snags were removed, these losses were greatly reduced, and did not exceed $381,000. In the latter year, 1832, in consequence of the successful working of the snag-boats, not a single boat was lost.

From 1833 to 1838 the Secretary of the Treasury reported that 40 steam-boats had been snagged on the Mississippi, and damage inflicted amounting to fully $640,000. This was probably far below the true figures.

In 1839 the total loss of boats in the river was 40, of which 2 were snagged, 7 struck on rocks and other obstructions, the total loss amounting to $448,000.

The first steps taken by the Government to improve the navigation of the river were in 1829, when Captain Shreve, a prominent steam-boat man was employed to remove the snags which had caused such a heavy loss of vessels. The system pursued in their removal was to run down the snags with a double steam-boat, the bows of which were protected with heavy beams plated with iron. A heavy head of steam was put on and the snags run down.

Captain Shreve did good work with this improvement, but he followed it up soon afterwards with a very unfortunate improvement that has given trouble ever since. Filled with the idea generally current at the time that it would be well to straighten out the river and shorten navigation, a channel was cut across one of the great bends just above the mouth of Red River, by which a distance of 30 miles was saved. This was known as Shreve's cut-off. Five days afterwards bars were formed at the mouth of Red River, at both entrances of the bend, leaving only 3 feet on one and 3½ on the other. On these bars dredge-boats were brought to work, but the bars have proved troublesome to this day.

River trade of New Orleans, 1813–1841.

* This does not include articles rafted down of which no record was kept.

† This includes the small amount of produce received by Lake Pontchartrain, from 1 to 6 per cent. of total. It is impossible to separate it from the receipts by river, since no separate account was kept, except for cotton and a few other articles.

During all this period, and despite all these difficulties, the number of arrivals at New Orleans and the amount of river business on the Lower Mississippi continued to steadily increase. The growth of the river traffic is well shown in this table.

In regard to the steam-boats, it should be remembered that the steady increase in arrivals each year does not fully express the increase in tonnage, because the boats were not only growing more numerous, but were increasing in size each year, and thus while they doubled in number between 1825 and 1833 they more than trebled in their carrying capacity.

In regard to the flat-boats and other craft, there is no sufficiently definite information for most of this period. It should be said, however, that while the steam-boats supplanted the flat-boats in many lines of trade, they did not entirely drive them off the river for fifteen or twenty years afterwards. During all this period when the Western cities were building steam-boats the flat-boats also were increasing in numbers. They were found serviceable in carrying hay, coal, etc., and in reaching the interior streams. The Mississippi counted some hundreds of tributaries. On some of these the settlements were sparse, and the surplus products afforded at best one or two cargoes a year, and these were sent much more conveniently and cheaply in flat-boats than in steamers. The steamers had passed the flats between 1820 and 1830 in the business transacted and the freight hauled, and from this time they increased the lead steadily. The number of flats, however, arriving at New Orleans kept but little if any behind the steamers, and as late as 1840 nearly a fifth of the freight handled in the Lower Mississippi went by flat-boat, keel, or barge. The early flat-boats had depended altogether on the current of the river to carry them down. The system of towing was tried in 1829, and a small steamer, which would be called a tug to-day, was successfully used in towing keel-boats up and down stream. The idea did not seem, however, to meet with much favor, the flat-boat men having a superstition that their conjunction with a steamer was not favorable to them, and it was reserved for a later generation to definitely try in the barge the system of towing freight up and down stream.

In but little more than a quarter of a century the steam-boat had secured a practical monopoly of the traffic of the Mississippi, and developed an interior commerce of immense proportions. It was during this period that the river country fared its best. Between 1830 and 1840 the river cities increased rapidly in population, wealth, and trade, and New Orleans, the port of the valley, advanced more rapidly than any city in

America. The commerce of the river—and all its commerce was carried on the Mississippi, except an infinitesimal amount that came through Lake Pontchartrain and the Carondelet Canal—steadily advanced with the increase in the steam-boat business and tonnage. The record of these years is as follows:

The character of the articles carried down the river to New Orleans illustrates the advance and development of the valley from its first rude stage. The receipts include a far greater number of articles. Glass, iron, and other manufactures begin to appear among them, and the shipments are not confined to purely agricultural products.

In 1839 there were 362 steamboats on the Mississippi and its tributaries, none over seven years old. The average tonnage was 302 tons. Only four vessels exceeded 500 tons: the *Emperor* and *Mediterranean*, each of 600 tons and deemed colossal boats in their day; the *Saint Louis No.* 2,571 tons, and the *John Randolph*, 555 tons. The boats had been built, namely, at Pittsburgh, Cincinnati, Jeffersonville, New Albany, and Wheeling.

THE CANALS.

At the very time that the steam-boat was pronounced a success and was counted on to solve the problem of getting the products of the Mississippi Valley to market a new competitor appeared in the field to divert some of these products from the river by a new route to the seaboard. In 1825 the Erie and Ohio Canals were begun. In 1832 the waters of the Ohio River were connected by canal with Lake Erie and there with the Hudson. In 1835 the State of Ohio alone shipped 86,000 barrels of flour, 98,000 bushels of wheat, and 2,500,000 staves through by canal to New York. It was a startling commer-

cial change, the first blow the river commerce received. Hitherto all the heavier products had gone down the Mississippi, thence to be sent by sea to New York, and the singular fact was presented of goods being shipped down from western New York, only a few hundred miles from Manhattan, via New Orleans and the ocean, a roundabout route of over 3,000 miles. These shipments were now made through Cleveland and Buffalo. New Orleans, which at this time had as much business as it could well handle, did not see anything to fear from canal competition, and, indeed, although the canals handled a large amount of produce, they did not seem to affect the river route very seriously. The period, 1825–1850, shows a greater increase in the river trade than in that of the canals. The latter were closed a considerable portion of the year, and generally the season when the farmers were desirous of sending their crops to market. Moreover, the tide of population was pushing still further westward into the regions where the artificial water ways, canals, could not compete with the natural outlets, the rivers.

The fifteen years of competition between 1825 and 1840 showed no proportionate gain for the canals. The produce of the lake country of northern Ohio and of western Pennsylvania found its way to the seaboard by them, but as far up the Ohio as Wheeling goods were sent mainly via river. The competition between the two routes was scarcely felt at Cincinnati until after 1850. All the leading tributaries of the Ohio, the Cumberland and Tennessee in particular, sent their produce down the river to New Orleans in steamers and flat-boats. A comparison of the business done by the river and the canals about this time shows that the increase in the canal traffic did not keep pace with the rapidly advancing population of the Mississippi Valley.

But a new and more dangerous competitor was coming into the field. A few miles of railroad were laid in 1830. The experiment was successful, and the railroad mileage was extended every year. There was no idea of competition with the water routes at that time, but the railways were regarded as excellent institutions to supply connection where there were no water ways open. And those built in the Lower Mississippi Valley were generally as feeders to the river. For the first ten or twenty years the roads were purely local, of comparatively short mileage, and but little idea was entertained of a connected through line to the West. There were breaks and gaps in all of them. One rode a few miles in the cars, then came a day's journey in a coach, then more rail, to be followed by another coach ride. From such transportation as this there was of course no danger to fear.

The spirit of internal improvement was strong throughout the country at that time, and immense works undertaken. The demand seemed to go hand in hand for the construction of railroads and the improvement of the rivers, and such a thing as the antagonism of river and rail seemed to be little thought of.

THE MEMPHIS CONVENTION.

In 1845 met the first great river convention. Its meeting place was Memphis. There were fifteen States represented by their leading citizens, and many of their Representatives in Congress, and John C. Calhoun, then Senator from South Carolina, was chosen president. The speeches made and resolutions adopted showed that the people of the river States had the utmost confidence in the future of the Mississippi, and regarded it as the great highway of the nation, to be cared for and improved by the Federal Government. The resolutions were strongly in favor of river improvement, and statistics innumerable were produced to show that in the course of a very few years the total foreign commerce of the United States would be as nothing as compared with the traffic on the Mississippi. Mr. Calhoun himself dwelt at length on the possibilities of the great American river, and figured out conclusively from the increase of the past twenty years that by 1886 44,000 steamers and flat-boats would be required to carry the produce of the valley to New Orleans, and 16,680 vessels needed to convey it hence to coastwise and foreign ports. These were undoubtedly correct enough figures, if no difficulties or set-backs were incurred. Indeed, they are underestimates of the business of the valley to-day. The danger of railroad competition did not strike the river interests as forcibly as it ought to have done. The place of these 44,000 steamers is largely supplied by locomotives.

The Memphis convention was a matter of the greatest importance in the history of the Mississippi Valley; it proved for the first time the importance of the river trade, and it showed the strength of the river interests. For half a dozen years the papers and people of the Mississippi Valley continued to talk with enthusiasm of the great convention, and it was counted on to turn back whatever trade had wandered away from the Father of Waters, and to assure the dominion of that stream.

The convention was certainly a body of considerable importance and it included many of the leading statesmen of the day. Conventions, moreover, were a novelty then and commanded more respect as representatives of popular sentiment than they proba-

bly do in this age, when they are far more numerous. The resolutions adopted were as follows:

"*Resolved*, That safe communication between the Gulf of Mexico and the interior afforded by the navigation of the Mississippi and the Ohio Rivers and their principal tributaries is indispensable to the defense of the country in time of war, and essential also to its commerce. That the improvement and preservation of the navigation of these great rivers are objects as strictly national as any other preparation for the defense of the country, and that such improvements are deemed by the convention impracticable by the States or by individual enterprise, and call for an appropriation for the same by the National Government.

"*Resolved*, That the deepening of the mouth of the Mississippi so as to pass ships of the largest class, cost what it may, is a work worthy of the nation, and would greatly promote the general prosperity.

"*Resolved*, That the millions of acres of the public domain lying on the Mississippi River and its tributaries, now worthless for purposes of cultivation, might be reclaimed by throwing up an embankment so as to prevent overflow; and that this convention recommends such measures as may be deemed expedient to accomplish that object, by the grant of said lands or an appropriation of money."

The resolutions of the convention were not without effect. That in regard to the swamp lands was adopted by Congress in 1849, and all the overflowed lands in Louisiana given for the building of levees; and in 1850 the provisions of the swamp-land act were extended to the other States. The result was soon seen in the construction of a system of levees along the entire river front from Memphis down on the left bank of the river and on a large portion of the right bank, thus bringing into cultivation a large amount of fertile land that had not been used hitherto because it was subject to overflow.

The convention of the river interests brought about a considerable agitation of trade matter, and many facts and figures were brought out which would not otherwise have been made known. The steam-boat tonnage of the Mississippi was found to be 1,262,780 tons, and the flat-boat tonnage 620,000 tons, making a total of 1,882,780 tons shipped and received each year. The value of the boats was $10,522,426, and the number of boatmen employed 20,418. The total river business was estimated at $231,432,090, which is probably very near the correct figure. Of this, New Orleans received $45,716,045, and shipped $35,225,600, making its total river trade $80,941,645, or one-third of the total.

New Orleans was by long odds the most important river city, for it was here that the great bulk of the produce of the Mississippi Valley found its outlet to market. There were regular lines of steamers to Cincinnati, Pittsburgh, and all the Ohio River points, but a large proportion of the produce of the Ohio Valley found its way to market by the cheap, if somewhat dangerous way, of flat-boats. Particularly was this so of Indiana, from which, through the Wabash and innumerable other streams, then considered navigable, came down each year hundreds of flat-boats. A considerable river business was also done with Saint Louis and with the lead country around Galena. Regular local packet lines ran to Vicksburg, Natchez, Rodney, and Bayou Sara on the upper coast, and up the Yazoo, Red, and Arkansas Rivers.

Of the lower river towns, that is those south of the Ohio, the most important were Memphis, Vicksburg, and Natchez, and it may be noted that in 1843 each of these shipped more cotton by river to New Orleans than they do to-day. The average annual shipments of Memphis down steamers were 100,000 bales, of Vicksburg 75,000 bales, and of Natchez 50,000.

The relative importance of the river towns is shown in their tonnage.

In 1842 the tonnage of steam-boats engaged in the Western trade was estimated as follows:

	Tons.
New Orleans	80,993
Saint Louis	14,725
Cincinnati	12,025
Pittsburgh	10,107
Louisville	4,618
Nashville	3,810

The flat-boats numbered, as far as can be estimated, 4,250, but they made only one voyage a year, and never returned up stream, while the steamers averaged from eight to ten per year.

In the next four years the river steam tonnage doubled, and reached 249,055 in 1846, when the total commerce of the Mississippi and its tributaries was $296,613,438, of which New Orleans possessed $77,193,464. In 1849 it had risen to $381,554,305, New Orleans's share being $81,989,692.

As the first two decades of the century showed the settlement of the Ohio basin, and a rapid increase in population and production, so the next two resulted in the settlement of the Lower Mississippi region from Louisiana to the mouth of the Ohio. The removal of the Indian tribes to the Indian Territory, the building of levees, and the immense increase in the demand for cotton, hastened the development of West Tennessee, Mississippi, Arkansas, and Northern Louisiana. The Western products received at New Orleans, although they did not fall off, constituted a smaller percentage of the city's total trade, while cotton and sugar became each year more important items commercially. In other words, the Western trade, while not growing less, did not increase as fast as that section advanced in population and production, nor as fast as the cotton trade.

It was during this period that the South first began to insist on the sovereignty of King Cotton, and New Orleans claimed, like Mahomet, to be its prophet. The rapid development of the cotton manufacturing industries in Europe incited the planters to devote more and more acres to it, and it became highly profitable to cultivate cotton even on credit. New Orleans was overflowing with money in those flush times, and lent it readily, and the credit system of the South was firmly established, to last even to this day. The system became universal among the planters, particularly those engaged in raising cotton and sugar, and New Orleans became not only the lender of money at a high rate of interest, but the depot of western supplies, which it advanced in large quantities to the planters throughout the vast region then tributary to it. The whole agricultural country along the Lower Mississippi and its bayous and streams became, in a manner, the commercial slaves of the New Orleans factors, and were not allowed to sell to any one else or buy from them. The western produce shipped down the river never stopped at the plantation, but was sent direct to New Orleans, and thence transshipped up the river over the same route it had just gone. When the big collapse of 1837 came the banks of New Orleans, with a circulation of $7,000,000, purported to have a capital of $34,000,000, a great majority of them being wrecked in the storm. Within a few years, however, New Orleans recovered from the shock and strengthened its hold on the planters.

COMPETITION WITH THE RIVER.

While the Mississippi Valley was listening at the Memphis convention to the story of its glories to come, and river men were calculating on the immense traffic that was assured the future, New Orleans was confident of the future. Few of its people anticipated any danger of its future, and it was predicted not only in American papers but in the British Quarterly Review that it must ultimately become, on account of the Mississippi, the most important commercial city in America, if not in the world.

That eminent statistical and economical authority, Debow's Review, declared that "no city of the world has ever advanced as a mart of commerce with such gigantic and rapid strides as New Orleans."

It was no idle boast. Between 1830 and 1840 no city of the United States kept pace with it. When the census was taken it was fourth in population, exceeded only by New York, Philadelphia, and Baltimore, and third in point of commerce of the ports of the world, exceeded only by London, Liverpool, and New York, being, indeed, but a short distance behind the latter city, and ahead of it in the export of domestic products. Unfortunately, its imports were out of all proportion with its exports. It shipped coffee, hardware, and other heavy articles like this up the river, but it left the West dependent on New York and the other Atlantic cities for nearly all the finer class of manufactured goods they needed.

Later on, when the West began to go into manufacturing itself, and Cincinnati and Pittsburgh became important manufacturing centers, New Orleans imported their goods and reshipped them to the plantations. Of these shipments up-stream over 75 per cent., strange to say, were articles which had previously been sent down-stream. Cincinnati sent its lard, candles, pork, etc., to New Orleans to be carried up by the coast packets to Bayou Sara and Baton Rouge. From these latter towns were shipped so many hogsheads of sugar and barrels of molasses to New Orleans to be thence sent by the Cincinnati boats to the Ohio metropolis. There was no trade between the Western cities and the Southern plantations, very little even with the towns; it all paid tribute to New Orleans.

The upper Mississippi had from 1850 become the center of immigration and production, and New Orleans, which had formerly depended on the Ohio River country almost wholly for its supplies, now largely got them from Saint Louis. About 1850 the traffic with Saint Louis exceeded that with Cincinnati. In 1859, 32 steamboats of 48,726 tons were required for the Saint Louis and 36 of 26,932 tons for the Cincinnati trade.

Next in importance to New Orleans among the lower river towns was Memphis, which had steadily increased its traffic, as follows:

1851	$4,978,000
1853	6,377,000
1854	8,266,500
1857	11,938,959

The boats landing at Memphis the latter year were: Steam-boats, 2,279; flat-boats, 379; of a total tonnage of 901,214. The shipments were nearly entirely to New Orleans. There were shipped 233,081 bales of cotton, of which 204,281 went south to New Orleans, 786 north to Saint Louis, and 28,014 to the Ohio River. The other shipments were wheat, flour, tobacco, furs, peltries, etc.

Vicksburg had passed Natchez, the leveling and settling of the Yazoo delta having made it the point at which the cotton floated down the Tallahatchie, Coldwater, Yalobusha, Sunflower, and Yazoo Rivers on flats was transferred to steamers. The construction of the Southern Railroad to Jackson had made it also the river port for the shipment of the cotton of central Mississippi to market.

Natchez continued an important social center and the shipper of cotton in the rich district of southwestern Mississippi.

Bayou Sara, as the most western point of sugar production on the Mississippi, was the terminus of what is known as the upper coast packets, and has continued so to this day.

Baton Rouge was important as the State capital of Louisiana, but its shipments of produce were small. Below Baton Rouge the steam-boats loaded directly from the plantations; the towns were small and of little commercial importance. During all this period the Mississippi River steam-boat had improved in size, in speed, and in appearance. Discarding the idea of making the river craft like those of the sea, a new genus of vessel had developed, especially adapted to the needs of the Mississippi and its tributaries, adapted to both passenger and freight traffic, of light draught and great speed, and good carrying capacity. Changes had been made from time to time in the machinery employed and in the shape and appearance of the boat until finally a standard was reached that has been changed little in the last half century.

The first boat with a saloon and state-rooms, was applauded by the press as luxurious in the extreme. These cabins were steadily improved until they became really the equal of the finest ocean steamers on the Atlantic. The passenger business of the steam-boats was very large; indeed, they carried all the passengers in the Mississippi Valley, and it was one of the surest sources of profit.

In size there had been a steady advance. In 1839 but 9 steamers on the Mississippi were over 500 tons, and 13 between 400 and 500. The average tonnage of a steam-boat was only 164. In 1846 108 steam-boats were built at a cost of $1,450,000, and of a tonnage of 51,660, an average of 479. One of these was a steamer of 887 tons, another of 750. They were built almost wholly on the Ohio River. Of the first 418 there were built at—

Pittsburgh	112
Cincinnati	70
Louisville, New Albany, and Jeffersonville	55
Wheeling	20

The others were at Brownsville, Marietta, Portsmouth, and other points.

SPEED OF STEAM-BOATS.

Recognizing the fact that the steam-boats had superseded the flat-boats only because of their greater rapidity, and that in the movement of products that route which moved fastest would be the most successful in the long run, the aim of the steam-boat builders was to make them faster. In this they succeeded admirably. Each steamer aimed to beat its predecessor, and the improvement in time made to all river points shows how rapid was the development of the steam-boat, how great the rivalry between them, and how well recognized was the doctrine that the problem of celerity was the problem of river transportation. The following tables, showing the best time from New Orleans and important river points, marks the improved speed of the steamers:

Best river time from New Orleans.

NEW ORLEANS TO NATCHEZ.

Year.	Name.	Time.		
		D.	*H.*	*M.*
1814	Comet	5	10	...
1815	Enterprise	4	11	20
1817	Shelby	3	20	...

NEW ORLEANS TO CINCINNATI.

1843	Duke of Orleans	5	18
1881	Reuben Springer	5	12

While the best time made in all these lines has been made since the war, it will be noted that the increase in speed has not been as marked during latter years as in the *ante-bellum* days. In the first twenty years the rapidity of steam-boat travel had been increased 308 per cent.; in the next twenty years 90 per cent.; in the last thirty years hardly 5 per cent. It would seem, therefore, that the maximum of speed was almost reached in the fifties, as the advance since then has been small.

STEAM-BOAT DISASTERS.

From the very first day that steam-boats had begun to navigate the Mississippi they had met with accidents during their first forty years. The following total of losses are counted against them:

	Lost.
1810 to 1820	3
1820 to 1830	37
1830 to 1840	184
1840 to 1850	272
Boats, the dates of whose loss is unknown	576
Total in forty years	1,070
Tonnage	85,256
Cost	$7,113,940
Killed at accidents	2,299
Wounded	1,881
Killed and wounded	4,180

Of the accidents, 166 boats were destroyed by fire, 209 by explosion, 45 by collision.

In 1840 the number of boats snagged was 21, valued at $330,000. In 1841 the number snagged was 29; loss, $464,000; in 1842, 68. In one month of that year 11 vessels were lost between Saint Louis and the mouth of the Ohio, a distance of only 175 miles, the loss being $234,000. In the seventeen months succeeding 72 boats were lost, valued at $1,200,000. In 1846 36 vessels were lost, of which 24 were by snags, sunken rocks, or logs; damage, $697,500; lives lost, 166. In consequence of these many accidents the cost of running a vessel on the river was estimated at three times that on the lakes. In his report to the Memphis convention, in 1845, Mr. Calhoun estimated the loss of steamers on the Western water ways at 11 per cent. of the entire number, the average life of a vessel being only nine years. In the six years between 1840 and 1846 no less than 225 steam-boats were lost on the Western water ways, an average of 56 per year. The record of 1846 is bad enough:

Steam-boats lost, 1846	120
Snagged	46
Sunk	38
Burst boilers	16
Colision	15
Destroyed by fire	13
Shipwreck	10
Cut down by ice	7

The following gives the actual losses in life of two average seasons of river business:

Years.	Number of accidents.	Number of killed.	Number of wounded.
1853	31	319	158
1854	48	587	228

The most active year in steam-boat business and the one chronicling the heaviest losses was that immediately preceding the war.

The following is the record for 1860:

Number steam-boats destroyed and damaged	299
Number canal-boats and barges	48
Coal and flat boats	208
Steam-boats totally destroyed	120
Causes of disasters:	
Sunk	111
Burned	31
Exploded	19
Collisions	24
Snagged and damaged	44

Causes of disasters—Continued.

Damaged by storm	39
Breaking machinery	21
Collision with river bank	8
Loss of life	254
Loss of steam-boat property	$2,000,000

The relative dangers of navigation are well shown in the table of insurance rates agreed on from New Orleans in 1847:

	Per cent.
White River not above junction with Black	1
Black River to Batesville	1½
Above Batesville on Black	2
Ouachita River not above Bayou Bartholomew	¾
Ouachita to Camden	1
Ouachita above Camden	1½
Black River (of Louisiana)	⅔
Red River to—

To Sparta's Bluff	1½
To Fort Smith	2
Above Fort Smith	3

The insurance rates, which largely increased the cost of transportation, operated unfavorably to the river route. In all the tables of freight rates the actual charges from any point in the Mississippi Valley to the seaboard and to Europe was less by steamboat than by rail or canal, but the loss of time, insurance, losses, and deterioration in many cases from the carriage by river more than offset this difference.

SOUTHERN AND WESTERN PRODUCE.

The Mississippi had been opened in the first five years of the Republic, and afterwards purchased by the United States, mainly to accommodate the trade of the western Ohio States. The West from 1840, when the railroads first began invading the Mississippi Valley, had become less and less interested in the river route to the ocean, and while there was still a heavy traffic from Saint Louis to Cincinnati and from Cincinnati to Pittsburgh, the decrease in the receipt of Western produce at New Orleans became marked. Here is a comparison for the eleven years preceding the war:

Table showing the value of the Southern staples and Western produce received at New Orleans each year.

Years.	Cotton.	Sugar.	Molasses.	Tobacco.	Other products.	Total.
1849–'50	$41,835,156	$12,396,150	$2,400,000	$6,166,400	$34,049,173	$96,897,873
1850–'51	48,756,764	12,678,180	2,625,000	7,736,600	35,127,539	106,924,083
1851–'52	48,592,222	11,827,350	4,026,000	7,196,185	36,409,951	108,051,708
1852–'53	68,759,424	15,452,688	5,140,000	7,938,650	37,442,973	134,233,735
1853–'54	54,749,602	15,726,340	3,720,000	4,228,100	36,912,756	115,336,798
1854–'55	51,390,720	18,025,020	1,255,000	7,111,370	36,424,713	117,106,823
1855–'56	70,371,720	16,199,890	4,582,242	7,982,800	45,119,429	144,256,081
1856–'57	86,255,079	8,137,360	2,685,300	11,892,120	49,091,510	158,061,369
1857–'58	88,127,340	17,900,608	4,601,015	13,628,327	42,798,256	167,155,546
1858–'59	92,037,794	24,998,424	6,470,817	9,161,750	40,283,879	172,952,669
1859–'60	109,389,228	18,190,880	6,250,335	8,499,325	42,881,486	185,211,254

During this period the value of the cotton receipts increased 160 per cent., of sugar and molasses 66 per cent., but the Western products showed little advance. They were being gradually carried away from New Orleans by the canals and railroads, principally the latter. The receipts at New Orleans were no longer for export as formerly, but almost wholly for the consumption of the city or for plantation use.

The following table shows the proportion of Western and Southern produce received at New Orleans during the years 1854–'58:

Value of produce of the interior.

Articles.	1857–'58.	1856–'57.	1855–'56.	1854–'55.
Cotton	$88,127,340	$86,255,079	$70,371,720	$51,390,720
Sugar	17,900,608	8,137,360	16,199,890	18,025,020
Tobacco	13,628,327	11,973,645	8,072,775	7,215,195
Flour	7,078,215	9,034,179	8,407,305	5,553,166
Pork	5,769,130	5,859,287	5,584,505	4,980,557
Lard	4,606,630	4,262,958	3,381,278	4,092,530
Lead	696,964	91,455	409,940	359,290
Molasses	4,601,015	2,685,309	4,582,242	4,255,000
Bacon	5,665,488	6,772,241	4,570,363	4,993,154
Corn	1,904,211	2,533,237	3,020,031	2,402,440
Whisky	1,001,656	2,329,132	1,785,036	1,306,248
Wheat	802,550	2,327,886	2,783,476	87,606
Bagging	463,983	512,448	610,290	608,670
Beef	497,490	484,585	824,289	610,414
Hemp	344,675	390,090	504,540	940,050
Bale rope	1,066,208	1,123,460	1,013,310	667,352
Butter	380,275	360,550	395,065	267,628
Hay	273,934	296,805	612,350	366,370
Hides	309,522	579,411	455,293	189,670
Coal	1,250,500	1,150,500	444,150	559,900
Potatoes	473,582	185,322	456,390	176,343
Staves	747,500	455,000	232,350	188,000
Tallow	27,150	28,950	32,265	21,330
Feathers	44,300	41,150	32,676	30,184
Oats	682,378	629,073	587,180	549,972
Corn meal	3,500	4,280	960	1,013
Other articles	8,808,416	9,557,967	8,888,412	7,260,001
Total	167,155,546	158,061,369	144,256,081	117,106,823

What is known as Western produce was but 18 per cent. of the total receipts at New Orleans, against 61 per cent. half a century before.

ROUTES TO THE SEABOARD.

In 1845 it was estimated that of the produce of the Mississippi Valley shipped to seaboard one half found its way to market via the canals, railroads, and other means of transportation to the Atlantic coast, and the other half went by way of New Orleans. Of the imports, however, New Orleans handled a much smaller proportion, and of those the heavier products were shipped to the West by the canals and the lighter by the railroads. In 1846 the receipts of flour and wheat at Buffalo exceeded those at New Orleans, and those who favored the river route began for the first time to express some alarm. The newspapers and magazines of the time are filled with a discussion of this question, and those of New Orleans insisted that the natural water way to the ocean was the cheapest, and no artificial route, whether rail or canal, could long successfully compete with it.

In the meanwhile, however, the receipts by the New York State canals at tide water had increased as follows:

Year.	Tons.	Value.	Year.	Tons.	Value.
1826	302,170	.....	1838	640,481	$23,038,510
1834	583,596	$13,405,022	1839	602,128	20,163,199
1835	753,191	20,525,446	1840	669,012	23,213,573
1836	699,347	26,932,470	1841	774,335	27,225,322
1837	611,781	21,822,354	1842	666,626	22,751,013

The change was most marked in the wheat and flour trade. In 1835 there arrived at tide-water by the Erie Canal 128,552 tons of wheat and flour, of a value of $5,719,795, and it increased as follows:

Year.	Tons.	Value.	Year.	Tons.	Value.
1835	128,552	$7,395,939	1841	201,360	$10,165,355
1836	124,982	9,796,540	1842	198,231	9,284,778
1837	116,491	9,649,156	1843	248,780	10,283,454
1838	133,080	9,883,586	1844	277,865	11,211,677
1839	124,683	7,217,841	1845	320,463	15,962,950
1840	244,862	10,362,862	1846	419,366	18,836,412

This was by a single canal. The Pennsylvania Canal transported a much larger variety of articles, while the Erie diverted the corn and wheat. The Pennsylvania route took annually some 20,000 hogsheads of tobacco that had formerly gone down the river, all the pig-iron manufactured around Pittsburgh, and large quantities of lard, bacon, and other Western products. Its imports included all kinds of manufactured goods, china-ware, cotton, dry goods, earthenware, glassware, hardware, hats, shoes, and muslin, and as early as 1846 it supplied the Ohio basin with more manufactured goods than the Mississippi did.

A comparison made by De Bow's Review at this time of the relative cost of transportation by rail and river declared the latter to be the cheapest, and estimated the cost of transportation of produce per ton per mile:

	Cents.
Canal, exclusive of tolls	1½
Railroads	2½
Steam-boats on lakes	3
Steam-boats on Ohio and Mississippi	½ to 1½
Average	¾

This is scarcely a fair statement of the case, but even with these figures it will be seen that as the steam-boats had to go from 60 to 120 per cent. farther in miles, had to pay a heavy insurance, and when they reached destination (New Orleans), the freight had a heavier ocean rate to pay than at the Atlantic seaboard, there was less advantage in the river route than these figures would seem to indicate.

In 1846 it was noted that for the first time the receipts of flour and wheat at Buffalo exceeded those at New Orleans. In 1847 the canals and railroad had still further invaded the river territory, flour being shipped from Cincinnati direct to New York. Over the Erie Canal the cost per barrel was $1.53; via Pittsburgh, $1.40; via New Orleans, $1.30; but the extra risk via latter route made the cost by the river $1.50.

Attention was soon after called to the fact that between 1835 and 1849 the increase of shipments of Western produce by the Erie Canal had increased: flour, 800 per cent.; wheat, 1,300 per cent.; staves, 4,000 per cent.; provisions, 1,000 per cent.; wool 2,000 per cent.

Big as these figures are there was little to alarm the river interests. The canals had undoubtedly captured a portion of the valley trade, but the lines of competition between the canal route and the river route became more definitely marked, and the Mississippi route was able to show that in the decade 1841–'51 it had kept ahead of the Hudson as the recipient of Western produce, as follows:

Received at seaboard from 1841 to 1851:

By Mississippi	$857,658,164
By Hudson	484,924,474

Of the former receipts, however, only $282,642,620 were of Western produce. The Hudson was receiving over three-fifths of the surplus products of the Western country.

Although no years in the history of New Orleans were apparently more prosperous than the ten preceding the war, although the city's receipts of produce constantly increased, the trade papers were continually sounding notes of alarm, calling attention to lines of trade lost, and singing Cassandra warnings.

De Bow notices, for instance, that in 1850 large quantities of flour were being shipped East from Cincinnati.

In 1859 De Bow's Review congratulated New Orleans that some of this trade was coming back to it, and pointed out that the New Orleans route was the cheaper for flour.

By rail and sea:	
Cincinnati to New York	$1.75
New York to Liverpool	.50
Total to Liverpool	2.25
By river and sea:	
Cincinnati to New Orleans	.50
New Orleans to Liverpool	.96
Total to Liverpool	1.46

These statistics, flattering as they were, could not turn the course of trade, and New Orleans never regained any considerable proportion of this flour or grain trade. In later years there was a marked movement in the shipment of grain from the upper-river States, but the Ohio River wheat and flour trades were measurably lost, and about the same time the tobacco trade, which in the earlier days of the city had been larger than the cotton trade, grew relatively less, a large portion of the crop finding an outlet elsewhere. The receipts of tobacco for the decade immediately preceding the war showed no advance over the receipts during the period 1840–'50, although there had been a large increase in the crop.

In 1852 the lead trade from Galena and Missouri, which had formerly passed through New Orleans, was lost to it, the railroads having made through connections with Galena. The receipts of lead at New Orleans had reached a maximum of 785,495 pigs in 1846, and had averaged nearly 600,000 pigs for the previous half-dozen years. It sank suddenly, and in 1856 was but 18,291 pigs, and soon after it disappeared altogether from the commercial records of New Orleans, being an item too small for consideration. This trade, however, was merely a transit one, the shipments being through New Orleans as the cheapest route to New York and Europe. In 1852 that route was no longer the cheapest, the railroads underbidding it.

Thus, with each year, did New Orleans become more and more a cotton city. In 1852, the very year that it was losing the lead trade of Missouri and Illinois, and the flour trade of Ohio, cotton passed in value all the other products received; and in 1859–'60 it was in value 60 per cent. of the total receipts, and the bulk of the other articles were imported simply to supply the cotton-planters and enable them to carry on their places.

While the railroads were taking away the produce of the Mississippi Valley, another evil was affecting the river route in the difficulty of getting the produce from New Orleans to the ocean, on account of the bars at the mouth of the river. The use of steam had greatly increased the size of vessels in the New Orleans trade. They had averaged but 500 tons each in 1840. In 1846, for the first time, the commercial reports recognize the arrival of steam-ships which were then but 109 in a total of the 2,981 ocean vessels that came to New Orleans. As early as 1829 attention had been called to the mouth of the river, and at various times between that date and 1851 surveys and reports had been made, without, however, accomplishing any actual result. In 1837 Northeast Pass, through which most of the vessels to New Orleans came, shoaled up and became useless, but Southwest Pass was found to serve present purposes, and was used until 1850.

By that time the draught of vessels to New Orleans had increased or 15 or 16 feet, and vessels of over a thousand tons could not get to the city without great difficulty. In 1852, within a period of a few weeks there were forty ships aground on the bar suffering detention there from two days to eight weeks. Many of these had to discharge their cargoes into lighters over 100 miles from their wharves in New Orleans. In 1853 a memorial presented to Congress by the commercial trades of New Orleans represented that vessels with cargoes valued at $7,367,339 were delayed at the mouth of the river, either unable to get into it or to get out.

This evil naturally increased the freight charges from New Orleans and tended to the injury of the river route. The evil was constantly recurring, and was not fully remedied until 1874, when the jetties were constructed.

These were a few of the difficulties which conspired just about the time that the railroads were penetrating into the Western country to turn freight in their direction. The situation was better recognized than it had been at the time of the Memphis convention, which had felicitated itself that nothing could then divert trade from the Mississippi.

De Bow's Review, the leading commercial authority of New Orleans, complained of the apathy in the port of New Orleans and pointed out that the eastern cities were turning trade away from it by canals and railroads. The general belief was that if New Orleans had a railway it could keep the trade, and immediately a railroad agitation was inaugurated which resulted in the construction, largely through the assistance of the city, of the Nashville Railroad. Save 80 miles westward and of the Opelousas Railroad westward, the city had possessed for twenty-odd years, the Pontchatrain road, but had done little with it.

The only railroad in the southern river country, the Vicksburg and Jackson, formerly the Southern road (now a portion of the Vicksburg and Meridian) had acted as a mere tributary to the river and carried the cotton from the rich countries of Central Mississippi to Vicksburg, whence it could be shipped by steam-boat to New Orleans. Its business steadily grew with the increased population and cultivation of Mississippi, and, commencing with 34,901 bales in 1847, it had increased to 55,880 in 1851, 70,523 in 1852, and 97,868 in 1853.

No one in the Southwest at that time imagined that railroads could compete with the Mississippi; and the former were regarded as feeders to the river or for getting the produce out of a country from which there was no exit by a water route, and it remained

for a future year to see railways built along the bank and parallel to the Father of Waters and its chief tributaries.

THE DECADE BEFORE THE WAR.

Although not relatively the most prosperous period in the history of river commerce, this period 1840–1860, is, in the view of most steam-boat men, the flush time of river commerce. In these twenty years its volume had increased fivefold, and the steam-boats had made a wonderful advance in beauty, size, and ornamentation. If the railroads and canals had carried off some of the produce of the valley, the river towns still kept up a large traffic, and New Orleans, Cincinnati, and Saint Louis competed with each other as to which should stand at the head of the list.

While the two latter sometimes passed New Orleans in the number of arrivals of steam-vessels, in the tons of freight, and value of produce, the Crescent City was never distanced until war closed it to commerce. It had regular lines to all the important towns, Pittsburgh, Cincinnati, Louisville, and Saint Louis, and it controlled, to a great extent, the commerce of the Tennessee, Cumberland, Arkansas, Red, Yazoo, and other streams.

In the period 1840-1850 the steamers running between New Orleans and Louisville were the *Gen. Brown*, *William French*, *Diana*, *Ed. Shippen*, and others. Later on came the *Bell Key*, *Bostona*, *Grace Darling*, *Peytona*, *Atlanta*, *Megara*, *R. J. Ward*, *Eclipse*, and *Shotwell*, with a tonnage of 1,200 tons.

Between New Orleans and the Tennessee River were the *Huntsville*, *Knoxville*, *Mohican*, *Cherokee*, *Choctaw*, *Eastport*, and others which brought out 180,000 bales of cotton each year and 15,000 hogsheads of tobacco that afterwards found the way by rail to the Atlantic ports.

On the Cumberland were the steamers *Old Hickory*, *Helen Kirkwood*, *Harry Hill*, and *Tennessee* running to Nashville and bringing to New Orleans each year some 120,000 bales of cotton and 12,000 hogsheads of tobacco.

The *Yorktown*, *Monarch*, *Duke of Orleans*, and ten other vessels ran regularly between New Orleans and Cincinnati.

The lines to Saint Louis included the *George Collier*, *Autocrat*, *Maria*, *Alexander Scott*, *Henry of the West*, *Meteor*, *Maria Denning*, *Imperior*, *E. J. Gay*, *Charles Chouteau*, *Illinois*, and *John Walsh*.

The Memphis trade between 1848 and 1861 included the *Bulletins* No. 1 and No. 2, the *John Semond*, *H. R. W. Hill*, *Ingomar*, *Prince of Wales*, *Ben Franklin*, and other steamers, and brought down to the Gulf 325,000 bales of cotton.

The Ouachita River trade between 1850 and 1861 included the *Rockaway*, *D. S. Stacey*, *Farmer*, *Paul Jones*, *Cora*, *Lizzie Simmons*, *R. W. Kimball*, *Frank Pargaud*, and others, and brought out of the river and its tributaries 150,000 bales of cotton.

The Red River lines between 1848 and 1861 included the *Caddo*, *Latonia*, *St. Charles*, *Compromise*, *H. M. Wright*, *R. W. Powell*, *R. W. Adams*, *B. L. Hodge*, *Duke*, *Grand Duke*, and *Dublin*. These steamers ran to Shreveport; other packets running above to Jefferson, and above the raft which here impeded navigation.

Another line to Alexandria and Natchitoches included the *P. F. Kimball*, *Peter Dalena*, *Prota*, and *Rapides*.

These vessels brought annually out of Red River some 250,000 bales of cotton and miscellaneous products of all kinds.

The Arkansas trade included the *Gem*, the *Thirty-fifth Parallel*, the *Arkansas*, which brought out some 150,000 bales of cotton, running as high as Little Rock, to Fort Smith in high water, and sometimes even above that point into the Indian Territory when the season was very favorable.

In 1859 there were 32 steamers, of a tonnage of 48,815, trading between New Orleans and Saint Louis, and 36, of a tonnage of 26,412, between New Orleans and Cincinnati.

THE BEST YEAR ON THE RIVER.

The season before the civil war (1859–'60) was inaugurated showed the largest receipts at New Orleans of produce and the heaviest business the lower river has ever handled; indeed it stands on record to this day as the maximum of river prosperity. The number of boats arriving at New Orleans was not as great as in 1846–'47, but the boats had in the meanwhile more than doubled in size and the steam tonnage reaching New Orleans was the largest that city ever saw and it has never equaled it since. Nor was the total of value of the produce as high as in one or two subsequent years. On the other hand, the prices of these latter years are the inflated prices of a paper currency. Reduced to a gold basis they will not amount to anything like the business of the year 1859–'60, which stands to this day the best on record in the Lower Mississippi. There reached New Orleans that season by river 2,187,560 tons of freight; and the total trade of the

city in the receipt and shipment of produce and in the export and import coastwise or to foreign ports was:

River trade	$289,565,000
Ocean trade	183,725,000
Total	473,290,000

Not only in its amount, but in the stretch of its river trade, the season 1859–'60 has never since been equaled. The arrivals of steam-boats that season at New Orleans shows this, and indicates the change in the river traffic that came in the next quarter of a century:

Number of steam-boats arrived at New Orleans during the season ending August 31, 1860.

Trade in which engaged.	Number.	Trade in which engaged.	Number.
Atchafalaya River	29	Louisville	172
Arkansas River	30	Macon and Tensas	83

Arrivals at New Orleans, divided by States.

From—	Number.	From—	Number.
Louisiana	1,835	Pennsylvania	54
Missouri	472	Texas	48
Mississippi	388	Illinois	12
Ohio	206	Virginia	9
Tennessee	186	Indiana	8
Kentucky	176	Alabama	6
Arkansas	140		

Of this trade, that of the Arkansas, White, Tennessee, and Cumberland may be said to be entirely gone. To-day no vessels run up Bayou Vermillion or Grosse Tête. The Yazoo trade is now transferred at Vicksburg instead of going direct to New Orleans. Evansville, Paducah, and Wheeling are ignorant of special New Orleans lines. The Cincinnati trade has fallen off three-fourths. The Lafourche trade is less, since many of the planters now send their goods by way of the railroad. The same is true of the Teche, along which stream now runs the Southern Pacific Railway. The Red River trade is less than one-fourth what it was then. The Texas and Pacific strikes the Red at Shreveport, Alexandria, and other points, and diverts a large traffic from it. The recently completed Vicksburg, Shreveport and Pacific carries a large amount of cotton across the country to Vicksburg, to be thence distributed by railroad. The Red River is seldom navigated above Shreveport, and whereas in those days vessels ran through to Jefferson, and even to White Oak Shoals, this is rare and almost unknown to-day. From the Ouachita and its tributaries a considerable amount of cotton is taken by the Vicksburg, Shreveport and Pacific at Monroe. The Greenville and Bend trade has dropped one-half in the last few years. The Memphis trade does not call for one-fourth the vessels then in use. One line of steamers suffices for the traffic of Louisville and Cincinnati with New Orleans.

The only improvement perceptible is in the coal trade with Pittsburgh, which has greatly increased in tonnage and importance, and which defies all railroad competition; in the lower river traffic, which shows a slight advance in consequence of the increased production of the lower parishes; and in the barge and mainly the grain trade with Saint Louis, which has been somewhat spasmodic, but which has grown to much larger proportions than it was at any time before the war.

The extent of the commercial area covered by the river traffic of New Orleans in 1860 will show what was lost in the four years of war that followed, and never fully regained.

New Orleans then absolutely controlled the entire river trade, commerce, and crops of the State of Louisiana. In Texas, through the Red River, it secured the crops of the northern half of the State; through the Arkansas and the Red it secured the products of the greater portion of the Indian Territory. It controlled the trade of the southern two-thirds of Arkansas, all the Ouachita and Arkansas valleys, all the river front, and a portion of the White River trade running up into Missouri. It controlled Mississippi with the exception of the eastern portion of the State, through which ran the Mobile and Ohio railroad and the tributaries of the Alabama. All the produce of western Tennessee and half that of middle Tennessee went to New Orleans; and in Kentucky a large proportion of the business went to the Crescent City. The bulk of the produce of the Ohio valley had been diverted to the lakes and Atlantic seaboard, but probably one-fifth of it found its way to New Orleans direct or by way of the Cincinnati and Louisville packets. In the Upper Mississippi probably a third of the surplus, or exported crops, similarly reached market by way of New Orleans, either direct or via Saint Louis.

The territory immediately tributary to New Orleans included all Louisiana, half of the settled portion of Texas, half of the Indian Territory, three-fourths of Arkansas, three-fourths of Mississippi, a third of Tennessee, and considerable portions of Kentucky and Alabama, probably 300,000 square miles, while indirectly tributary to it, through Saint Louis, Cincinnati, and Louisville, was a region twice as great.

Yet it was admitted at the time that New Orleans and the river route were losing some trade, and it was felt that the railroads were diverting traffic away from it. They had tapped the river at various points. The tributaries running into the Upper Tennessee, had formerly sent down their produce by flat-boats to New Orleans, the boats reaching the city in fleets of thirty and forty. Railroads had diverted much of this traffic to Charleston, Savannah, and the Atlantic cities. The trade of northern Alabama had formerly come via the Tennessee to New Orleans. It was almost gone and the receipts from North Alabama were actually less in 1860 than in 1845, although the crops had grown manifold larger. The lead trade of the Upper Mississippi had been diverted from the river by the railroads. At Cincinnati a large portion of the flour and grain that had been formerly sent down the river traveled either up it to Pittsburgh or went direct from rail to New York, or by canal to Cleveland, Buffalo, and thence by the Hudson. In the twenty years between 1840 and 1860, during which the competition of river and rail had been inaugurated, the production of the Mississippi Valley had increased far more rapidly than the receipts at New Orleans. The river traffic had increased in the aggregate, but lost relatively.

The Mississippi carried a much larger tonnage, but a far smaller percentage of the total traffic of the valley. The loss was most marked in Western products. Forty years before, these had constituted 58 per cent. of the total receipts at New Orleans. In 1859–'60 they had fallen to 23 per cent. although in that period the West had made the greatest increase in population and production. What was lost here, however, was more than made good in the cotton and sugar crops, and the river trade of New Orleans therefore showed no decline but a steady, active, and positive advance.

During all this period "the levee" of New Orleans, as the river landing of that city was called, was the wonder of every visitor. It was beyond doubt the most active commercial center of the world. Here, side by side, lay the steam-boats and flat-boats of the river, the steamers, ships, and numerous ocean vessels. Here the entire business of New Orleans and of the greater portion of the valley was transacted. The levee was the landing, warehouse, commercial exchange of half a continent, and the freight handled there exceeded that to be seen on any single dock-yard of London or Liverpool.

Value of receipts of produce from the interior at New Orleans from 1840 *to* 1861.*

Year.	Amount.	Year.	Amount.
1840–'41	$49,822,115	1851–'52	$108,051,708
1841–'42	45,716,045	1852–'53	134,233,735
1842–'43	53,782,054	1853–'54	115,336,798
1843–'44	60,094,716	1854–'55	117,106,823

1845–'46	77,193,464	1856–'57	158,161,369
1846–'47	90,033,256	1857–'58	167,155,546
1847–'48	79,779,151	1858–'59	172,952,664
1848–'49	81,989,692	1859–'60	185,211,254
1849–'50	96,897,873	1860–'61	155,863,564
1850–'51	196,924,083		

* This represents the total receipts at New Orleans, from 94 to 99 per cent. of which was by river and some 1 to 6 per cent. by way of Lake Pontchartrain.

The character of the produce gives some idea of the region then tributary to New Orleans, at least in the export of its produce if not in the receipt of supplies.

Receipts of produce from interior from 1840 *to* 1846.

The following tables give some idea of the value of these different lines of trade, and show to what extent the increased value of trade was due not to increased receipts so much as to advance in price. The years 1846–'47 and 1856–'57, a decade apart, are selected for the comparison:

Receipts of produce from the interior, and value, for 1846–'47.

Articles.		Amount.	Average price.	Value.
Apples	barrels	39,612	$3.00	$118,836

There was a steady but small increase in the number of arrivals of steam-boats at New Orleans. The increase in the number of boats, however, does not fully illustrate the growth of the river business as well as the tonnage, because as will be observed there was a rapid increase in the size and tonnage of steam-boats.

*Steam-boats arrived at New Orleans, together with tons of freight received by river.**

Year ending August 31—	Number.	Freight.
		Tons.
1840-'41	2,187	557,500

1859-'60	3,566	2,187,560
1860-'61	3,177	1,375,000

*Not including rafts, etc., floated down.

The records of receipts of produce at New Orleans are tolerably accurate. There are no records of the outgoing tonnage, but this can be arrived at without much difficulty. The consumption of New Orleans being determined, the outgoing produce, both foreign and coastwise, the difference plus the imports, foreign and coastwise, represents the articles shipped up the river from New Orleans. A large portion of the Western produce went in this way, coming many hundred miles down the river, to be reshipped to the plantation 300 and 400 miles above the city. The shipments up stream from New Orleans averaged about 47.5 per cent. in weight and 57 per cent. in value of those coming down the river, the difference being for city consumption or export.

THE FLAT-BOATS.

The flat-boat trade slowly went out during this period. It had been a cheap but very unsafe way of getting produce to market. It is estimated that not more than three-fourths to four-fifths of the flat-boats when started down river to New Orleans ever reached that port, the others being snagged or lost. A squall on the river would sink a dozen at a time. At the same time the flat-boat offered great advantages to the farmers living along the smaller streams penetrating into the center of Indiana and Ohio. Indeed, there was no other way of their getting their produce to market, as the low water, snags, etc., rendered it impossible for the steam-boats to penetrate there. A flat-boat was accordingly built after the crop was gathered, loaded down with produce, and the spring tide waited for to float it out.

Flat-boats arriving at New Orleans.

The steady decline of this trade can here be studied. The only State which shows an increase is Pennsylvania, due to the coal trade. Indiana, particularly the Wabash country, sent a considerable amount of produce, largely hay, to New Orleans by flat-boats; and so did the upper tributaries of the Tennessee River, whence the tobacco was shipped on flat-boats. On the other hand, the flat-boat traffic of the Upper Mississippi had given way to the steam-boats, and neither Missouri nor Iowa sent a single flat to New Orleans. Some remarkable fluctuations will be noticed in the arrivals from year to year, attributable to the condition of the river. When the water was high, as in 1851–'52, the flat-boats got out without any difficulty. On the other hand, in the previous season, which was a low one, the flat-boat tonnage was reduced much below the average. After 1856 the flat-boat played so unimportant a part in the river traffic that it ceased to be enumerated among the arrivals.

OCEAN VESSELS.

In the meanwhile the sailing vessel was rapidly giving place to the steam-vessel on the ocean, as merchants began to recognize the important element of time in commercial transactions, and as a consequence the size of sea-going vessels steadily increased.

The following table shows how rapidly steam-ships were supplanting sailing vessels by the arrivals at New Orleans:

Years.	Steam-ships.	Ships, barks, and brigs.	Schooners.	Total sailing vessels.
1846–'47	109	.....	.....	2,872
1847–'48	206	1,926	795	2,721
1848–'49	136	1,594	456	2,050
1849–'50	147	1,379	666	2,045
1850–'51	190	1,250	704	1,954
1851–'52	213	1,465	673	2,138
1852–'53	244	1,524	596	2,120
1853–'54	204	1,266	478	1,744
1854–'55	225	1,166	426	1,592
1855–'56	234	1,510	399	1,909
1856–'57	212	1,281	441	1,722
1857–'58	267	1,250	283	1,538
1858–'59	300	1,289	409	1,698
1859'- 0	315	1,282	321	1,603
1860'–61	252	1,038	289	1,327

In thirteen years, 1846 to 1859, the number of steam-vessels arriving at New Orleans had increased threefold, the sailing-vessels falling off at the same time nearly one-half. This does not fully represent the increase of the steam tonnage for the reason that the steamers grew larger with each year.

The change made itself felt in another way. The growing size of ocean vessels rendered it a difficult matter to get over the bar at the mouth of the Mississippi. As already noticed, many of the vessels grounded there, to the injury of the river trade by the increased cost of shipping thus entailed.

The crops of 1859–'60, particularly in the South, were the largest ever known, and New Orleans, as the chief exporter of Southern produce, enjoyed the best trade it had ever seen. The next year was to see a change, and the mouth of the Mississippi, more thoroughly closed to commerce than they had been by the order of Merales. The commercial year throughout the cotton States closes August 31. Four months after the splendid season of 1859–'60 had closed the States of Louisiana, Mississippi, and Arkansas had seceded from the Union; and the mouths of the Mississippi which the United States had purchased fifty-eight years before were lost to it. As the Western States had years before demanded the opening of the Mississippi to the commerce of the upper river, so this demand went forth again, and as well from a commercial as from a military point of view, it was deemed necessary for the Federal forces to obtain possession of the Mississippi and keep it open.

In the Western papers of the time the question of the opening of the Mississippi will be seen to be an important part in the discussion of the situation, for they did not then feel that the produce of the new country opening in the Northwest could be safely or profitably carried overland by rail. Indeed, many portions of that country still depended on the river route, being wholly without railroads. Yet the difference in the demands made for the Mississippi shows that it was not of the same importance in 1861 as in 1798. Then many of the Western pioneers declared that they could not do without it, and threatened secession unless the Government secured its free navigation for them. In 1861, while their descendants demanded it, they recognized the fact that the Western States were not wholly dependent on the Mississippi, and that they had other outlets to market—the lakes, canals, and, above all, the railroads.

The history of the next four years is mainly military. The river became the center of war, not of commerce, and the boats that sailed upon it were men-of-war and gun-boats, instead of peaceful steamers and barges.

Recognizing the importance of the Mississippi as a means of dividing the Confederacy and of keeping up communication with the West, one of the first acts of the administration was to send a large expedition, naval and military, to New Orleans. In 1862 the port of New Orleans was thoroughly blockaded.

This does not seem to have been fully foreseen through the Southwest, for but a small proportion of the crop had been exported when the river was bottled up. The cotton crop was more slowly marketed in those days than it is now. When Farragut's fleet arrived off the mouth of the river but a small portion of the cotton crop had been exported and a majority of it was left in the city or in the country tributary to it, nearly all of which was lost in the events that followed. During the first part of the succeeding season, 1861–'62, although all the interior rivers were open to New Orleans, and it was an easy matter to send the cotton there, the fact that it could not get out to sea even after it reached New Orleans operated to completely destroy the cotton trade of the

city, and only a few thousand bales from the immediate neighborhood were sent there, the owners and shippers preferring to take their chances of getting their cotton out on blockade-runners by way of some of the smaller Gulf or Atlantic ports not so strictly guarded. No tobacco came to New Orleans, no Western produce of any kind, and in consequence of the peculiar situation, sugar suddenly boomed forward, and became in value not only the largest item of receipt, but actually equalled all the others combined for the season of 1861–'62.

In April the Federal fleet passed the Confederate forts defending the river and occupied New Orleans. It was greeted with a scene of wholesale destruction, characteristic of the then commercial condition. A number of the steam-boats engaged on the river had already been converted into gun-boats of one kind or another and used in the defence of the city. When the fleet came up the river those boats which could steamed upstream, to seek refuge in the Red, Arkansas, and Yazoo Rivers, and beyond Port Hudson. Those that could not do this, were burned to prevent them falling into the hands of the Federals. Cotton being deemed at that time a contraband, the possession of which would strengthen the Federal cause, all of it in the city from the crops of 1860–'61 and 1861–'62 was ordered to be destroyed and was conveyed from the warehouses and presses to the river front, piled up on the wharves and publicly burned. A quantity of sugar, molasses, and other produce was similarly destroyed through a misunderstanding of the order.

A number of vessels at the wharf, on which cotton was stored, were also burned to prevent them falling into the hands of the Union forces, and sent down the river as fire-ships.

The commerce of the Lower Mississippi for the next few years was much demoralized. In actual volume the receipts of the first year of its occupancy by the Federal troops, half of which time it was under the Confederate Government, was less than it had been since 1820, and the succeeding year, 1862–'63, was even worse, the actual receipts of produce by the river being the smallest since Louisiana had been purchased from France. It is true that the value of the receipts was apparently large, but this was due to the depreciated currency, to the war prices, with cotton worth several hundred dollars a bale. The first year of the Federal occupancy of the city was the worst in the record of the lower river trade. There was tributary to New Orleans only 140 miles of river, for the Mississippi was closed at Port Hudson, thus cutting off the Red and all its tributaries except the Lafourche. Over this extent of river some few steamers ran, picking up whatever freight there was, carrying supplies to the planters or to the Federal forces; but the business was small and risky. The Federal forces held possession only of the country immediately on the river, which was constantly patroled by gunboats. The Confederates held possession of the country a few miles back of it, frequently made excursions to the river, and opened fire on any passing vessel, gunboat, or even steam-boat.

The receipts of New Orleans for this season were just enough to support the population of the city. There were no exports save of such cotton as could be raised inside of the lines or smuggled in. Trade conditions were completely reversed. But a few years before the produce of the West had been shipped down the river to New Orleans for export to New York; now the articles known as Western produce came from Ohio and Illinois by way of railroads to New York, and thence by ocean steamer.

With the capture of Vicksburg and the opening of the river from Cairo down came a large increase in the river trade. Between the seasons 1862–'63 and 1863–'64 the receipts of Western produce at New Orleans more than doubled. The figures of value for the latter year are favorable, but much of this is due to inflation. The next season saw another large increase, and it saw peace.

The arrival of steam-boats at New Orleans during the war period is somewhat defective, for the reason that boats merely patroling the river are included. The tables of values are based on the paper dollar, and to bring them down to the standard of previous years the gold dollar should be divided by 2 and 3.

Arrivals of steam-boats, together with value of produce received, in greenbacks.

Year.	Number.	Amount.
1861–'62	1,456	$51,510,990
1862–'63	655	29,766,454
1863–'64	1,414	79,233,987
1864–'65	1,481	113,649,280

The character of the receipts were as follows:

When in the fall of 1865 business was resumed, the Price Current set to work to estimate how much trade the war had taken from the river and New Orleans. It found that the Western States were now getting many of their supplies, coffee, for instance, which had formerly reached them by the river, from the Atlantic by means of the railroads. A large portion of the trade that the Mississippi had formerly possessed was gone, much of it never to return. The Price Current estimated the decline in the shipments of Western produce down the river from 75 to 90 per cent. As compared with the year before the war the year after it showed the following losses:

Articles.	Quantity.	Articles.	Quantity.
Apples.....barrels...	31,514	Lard.....tierces...	62,803
Bacon.....casks...	31,433	Corn.....sacks...	1,168,666

Pork, in bulk.....pounds...	2,381,076	Oats.....sacks...	380,612
Lead.....pigs...	80,959		

Although the traffic of New Orleans and the Lower Missssippi presents rather high figures, all things considered, during the war period, it was due simply to the fact that cotton then commanded such a high figure. It had fallen off at least 80 per cent. in bulk. The receipts of the city consisted wholly of the supplies for the army and the sparse population living within the Federal lines and the shipments to market of the produce of the small section of country in Louisiana where any agriculture was carried on. Trade conditions had changed during these four years of war as they had never done before, and save in two or three lines the river traffic has never since caught up to the condition that it had previously enjoyed. Thanks to the embargo of war, the railroads had gained in four years an advance on the Mississippi which under ordinarily favorable circumstances it would have taken them twenty years to have secured.

THE POST BELLUM PERIOD.

With a return of peace New Orleans and the Lower Mississippi Valley counted upon a restoration to much the conditions prevailing in 1860–'61, when the war broke out; but they were doomed to disappointment, and it soon became evident that a large portion of the Western produce which had formerly been sent to market via the river had been diverted to other points, never to return. The value of receipts for that year was swollen to a high figure, but this was due almost wholly to the cotton which poured into New Orleans. The crop, not of a single year, but of four years, was being marketed. Among the receipts were bales three and four years old, which had been stored away in some barn during the war waiting for a chance of getting to market. New Orleans secured a large proportion of the cotton, but not as great a percentage as it had been in the habit of handling in the past. The greatest decline in the river trade, however, was in Western products. The receipts of flour were under a million barrels, most of which was needed for home consumption, only one-fourth of it being exported. The pork and lard just supplied the home demand; and there were no receipts of wheat, a Western product, the transportation of which the river route had once disputed with the Erie Canal.

It was found, also, that the old way of doing business had to be changed. Previous to the war New Orleans had possessed no regular commercial exchange, and a large proportion of its business was transacted immediately on the levee. The necessity of some place where information could be obtained as to the movement of crops and current prices that could be depended on resulted in the organization of the Merchants' Exchange, on the model set by the Northern and Western cities.

New Orleans was still without any through railroad line, its two railroads, the New Orleans, Jackson and Great Northern and the Louisiana and Texas, being as yet badly connected with the other railroad systems of the country. Both roads brought considerable produce into the city, but the Mississippi was still the source of nearly all the commerce of the city. There were steam-boat lines to Cincinnati, Saint Louis, and on all the neighboring streams, the Red, up which vessels run as far as Jefferson, bringing down to New Orleans a large proportion of the cotton crop of northern Texas, the Yazoo, which is now transfer trade at Vicksburg, the Ouachita, La Fourche, and other streams.

Nor did the next year show any recovery of that lost Western trade New Orleans was looking for. There was an absolute decline in the receipts of hay, pork, bacon, lard, and nearly all the food crops.

The river route, however, witnessed an important change in its commercial methods in the establishment of the barge line, and New Orleans congratulated itself over this new system of transportation, and expressed confidence that the problem of river competition with rail had been solved, and that much of the Western produce trade would return.

"Perhaps we shall witness grain transferred in bulk in these barges," was the suggestion of one of the papers, which was afterwards to be realized.

A severer difficulty was encountered, however, in the condition of the bars at the mouth of the river. Since 1850 the trouble with these obstructions had been growing greater as the size of vessels engaged in ocean traffic had increased. The expense of being delayed at the passes, the cost of towage, etc., were burdens to the commerce of New Orleans which the entire Mississippi Valley felt. The delegates from the Merchants' Exchange at the river convention in Saint Louis discussed the question and called upon Congress to deepen in some way the passes to New Orleans.

The introduction of the barges and the construction of steamers built entirely for transportation, and not incumbered by the magnificently fitted-up cabins, which had formerly been a *sine qua non* in river steamers, had a marked effect in reducing river freights; but they do not seem to have taken much Western produce away from the railroads or brought it to New Orleans, and the season of 1869–'70 showed no increase in any line of business. Saint Louis was sending provisions to within a few hundred miles of New Orleans, and the merchants complained. Memphis, which had previous to the war been a dependent of the Crescent City, shipping all its cotton there, had developed a large and increasing plantation trade. New Orleans had measurably lost its trade in Western produce, and imported only so much pork, bacon, lard, etc., as was needed for local consumption and for shipment to the neighboring towns of the Gulf coast. It no longer received this produce for export to Europe or New York. Cotton was becoming more and more the chief element in the trade of the city, and the necessity of conducting it on a more business-like basis had resulted in the organization of the Cotton Exchange.

Even of cotton a considerable proportion has been diverted from the river and New Orleans by the construction of railroads. The crops of northern Alabama no longer came in that direction, and a small proportion of the Arkansas and Texas crops reached the city. In 1859–'60 nearly 46 per cent. of the cotton crop of the country had been marketed at New Orleans. In 1866–'67 its proportion was but 35 per cent.; in 1870–'71, 33 per cent., and 1876–'77, 27 per cent.

River transportation had been greatly cheapened, but already the lower Mississippi was beginning to experience the competition of the railroads, and the complaint was made that these lines touched at various river points where they offered very low rates for business, and actually carried freight for less than it cost them in order to prevent the steamboats from getting it.

In 1870 New Orleans secured its third road, the New Orleans, Mobile and Texas. Its railroad lines were as yet without any important river connections and bad taken little if any traffic from the steam-boats that the latter had formerly handled. Where the railroads were beginning to "pinch" was at points above, like Memphis and Saint Louis, whence the trunk was carrying away a great deal of freight that had formerly come down the river to New Orleans.

In 1871 was noted the first receipt of produce in New Orleans by rail from a river town. This was a large quantity of flour from Saint Louis, which came the via Saint Louis and Iron Mountain, Mobile and Ohio, and New Orleans, Mobile and Texas (now the New Orleans branch of the Louisville and Nashville Railroad). The flour was brought from Saint Louis for 75 cents a barrel, the river rate, but saving the insurance. This movement, prophetic of the future, was one to cause surprise, inasmuch as New Orleans had close, excellent, and cheap connection with Saint Louis at the time. It boasted loudly of the barge line, with its 73 barges. By this line grain shipments had been made down the river as early as March, 1869, and 1 to 2 cargoes had been sent each subsequent month during the summer. The freight to New Orleans was 10 cents, charges at that port, 2; freight to Europe, 24, making a total of 36, against 47 by the Erie Canal route during the summer, and 61 by rail via New York in winter when the canal was closed.

But although the grain trade showed promise, the general outlook was far from gratifying, and the complaint was made of a still greater diversion of trade to Western cities. The railroads in the lower Mississippi Valley, moreover, were now handling a portion, as yet very small, of the trade that had been formerly monopolized by the steamers. The year 1872–'73, just before the beginning of the jetties, gives a fair comparison of the amount of business divided between the two routes, rail and water.

* With the exception of cotton, little if any of these receipts are by lake.

It will be seen that the steam-boats were still well in the lead, and that they brought to New Orleans three-fourths of all the produce, Southern and Western, received there. The railroads had made very slight invasion on the river. They generally brought products to New Orleans from interior points, which would not have reached that city by any other route. More than two-thirds of the cotton, two-thirds of the tobacco, nearly that proportion of the sugar, practically all the coal, staves, and cotton-seed, and seven-eighths of the Western produce reached New Orleans by the river route.

The railroads handled a proportion of the cotton and cane crops, cotton-seed oil and cake, and a majority of the manufactured goods.

In 1874–'75 the most important work in the development of the trade of the Mississippi Valley was accomplished in the construction of jetties. This work proved an engineering success, and while it did not divert as much trade to the river as had been expected by some, its commercial effects were felt throughout the Mississippi Valley. In reducing freight rates from New Orleans, which it materially affected, it lessened the cost of shipment by the river route and compelled an equal reduction in the railroad rate, and thus added so much to the value of the grain and meat on the farm.

The passes had been sufficient for the vessels trading with New Orleans in its earlier years; but from the day that steam had come into play and the size and draught of ocean vessels had increased they were no longer satisfactory. During the entire decade before the war the commercial history of New Orleans is largely made up of demands on the part of its merchants, and, indeed, of the entire valley, for the improvement and deepening of the passes and the removal of the bar which had obstructed the passage of ships. Every river convention passed a resolution insisting upon the work being done. The Government made several attempts to remove the bar, in which at best temporary relief was afforded. After the war the same systems were pursued and various plans tried with little success. The dredging of the channel, for which purpose two large and powerful vessels were employed, afforded a temporary and very unsatisfactory relief. Several more plans of bar removal were proposed. In 1875 Congress pronounced in favor of the jetty

plan suggested by Capt. James B. Eads, and the work was begun the same year. It was practically completed in 1879, but long before that it was known that the system was a success, and the river trade began to feel the revivifying effects of this new opening and this material reduction in freight rates to Europe.

The success of the work on the jetties gave New Orleans a great impetus. The river trade was in an encouraging condition, feeling, it is true, the competition of railroads, but not alarmed over it.

In the Vicksburg and Bends trade, the four steamers, *R. E. Lee*, *Natchez*, *Frank Pargaud* and *Katie*, could bring out 20,000 bales a week, and literally "coined money."

In the Red River trade there were 14 steamers running regularly, with a weekly capacity of 25,900.

In the Ouachita, Bayou Bartholomew, D'Arbonne, and Saline trade were 6 steamers able to transport each week 15,000 bales of cotton.

The Saint Louis trade supported 14 steam-boats besides the barge line, the upper coast 4, the Opelousas trade 4, with steamers running into Bayous, Bœuf and Des Glaises, the Ohio River 12, Bayou Lafourche 3, Bayou Teche 1, Bœuf River 3, Memphis 3, lower coast 5, Arkansas and White 2, and Bayou Macon 2, making 77 regular packets running daily, weekly, and bi-weekly to New Orleans, besides the large number of transient vessels which made occasional trips to all these points.

There is little change to chronicle in the next few years. The railroads were being constantly extended and were securing a larger proportion of the freight. The Louisiana and Texas Railroad brought a considerable amount of freight from the Teche country that formerly came by boat. The building of the New Orleans Pacific branch of the Texas and Pacific tapped the Mississippi at several points, Donaldsonville, Plaquemines, etc., the Atchafalaya, and ran nearly parallel to Red River, touching it at Alexandria, Shreveport, and other important shipping centers.

The record of the river business during the years 1879–'80, when the jetties were formally opened to commerce, gives a good idea of its condition then. The bu ness of that season has never since been exceeded, or indeed, equaled, and while the territory tributary to the New Orleans boats was more circumscribed than in previous years, it was still large and the business satisfactory.

The following gives the river business of New Orleans that season:

Steam-boat arrivals at the port of New Orleans for the year ending August 31, 1880, *showing the locality from which they were reported and the number of trips made by each.*

From that date to the present time, despite occasional spurts, the steam-boat business of New Orleans has declined. There has been less done, and less profit in it, and the territory tributary to New Orleans by the Mississippi has been materially reduced. The receipts of produce at the city have shown like changes; but the railroads have steadily increased their business at the expense of the steam-boats. The steam-boat men fully appreciated the situation, and various plans have been suggested to revive the river business, but with no material success.

At the beginning of the commercial season of 1883 the complaints of the merchants that the steam-boat freights were high, and the contrary complaints on the part of the river men of a falling off in business, resulted in a determination to frame a just and equitable tariff for all the lower river points trading with New Orleans. Joint committees of the Cotton Exchange, Chamber of Commerce, and Produce Exchange met to consider this matter, and subcommittees were appointed to frame tariff charges. After a great deal of labor and an impartial investigation of the different interests of commerce and the river carriers, a rate was agreed on as to the upper coast trade between New Orleans and Bayou Sara. For this trade two rates were made, one to public landings (points where the steam-boats always land), and the other to way landings, that is, to any point where the steam-boat may be hailed. The difference in rates was on account of the difficulty and cost of landing and the delay and danger. Starting on the basis of this tariff, additional tariffs were made for all the other river points. The allowance for the Vicksburg trade was one-fifth greater for "way" landings than for public landings.

The rates to Helena were made the same as those to Vicksburg in consequence of the liberal tariff allowed to Vicksburg and the competition between Southwestern points and New Orleans.

The rates to the Yazoo and Sunflower Rivers were made double those to Vicksburg, with one-fifth added for way landings on the Yazoo; and for points on the Tallahatchie River 25 per cent. was allowed over the rates made for the Yazoo and Sunflower Rivers.

The high-water tariff of 1880 was adopted for Red River, and the same rate was fixed for the Ouachita River trade as for all points on Red River below Alexandria.

As New Orleans had definitely lost the Arkansas and White River trades by that time, it was deemed superfluous to fix any tariff for those streams.

On September 12 the tariff was agreed on and submitted to the steam-boat men.

This tariff was at first not generally well received by the steam-boat men. While some of the rates were favorable, indeed more favorable than they were willing to give, others were not. Complaint was also made that the tariff had been adopted and made

public without the river men being called into consultation or allowed to point out where certain rates allowed them were too low. The Red River steam-boat men especially protested against the tariff framed for their trade, and declared that they could not accept the rates. Instead of the tariff being adopted in a body by the steam-boat men, it was accepted piecemeal. The Red River steam-boats finally arranged a compromise with their patrons. The other river interests accepted the merchants' tariff, which, with some amendment on account of the competition of railroads, is the basis of the present freight charges on the river.

The complaint of the steam-boat men that the insurance rates by river were excessive and operated unfavorably to river interests was not acted on.

The attempt to systematize the river traffic and to frame a proper tariff proportionate to the distance traveled proved only partially successful and had little effect in diverting trade back to the river from the railroads. The steam-boats found themselves compelled to frequently change rates to meet the cut of the railroads at competing points, and while the card rates are still in existence they are subject to cuts of 25 and 50 per cent.

Elsewhere is given the changes and fluctuations that have occurred in river business during the last six years.

THE SCHEME OF A SYNDICATE TO PROVIDE A NEW OUTLET FOR MISSISSIPPI VALLEY PRODUCTS.

[From the Saint Louis Republican, January, 1888.]

Col. Malcom G. Webb, of Paris, France, is at the Southern. He is an American, but has lived in Europe for seventeen years, principally in France. He was at one time well known in American journalism, and for nine years after he went abroad he represented Reuter's Telegraph Company of London. He is also an engineer of national fame, and has been connected with some of the leading canal enterprises of the world. He is here representing a European syndicate who propose to open up an outlet for the Mississippi River to the Atlantic coast. To a Republican reporter Colonel Webb spoke with confidence, and thought the enterprise would succeed. He said: "I am here in the interest of European capitalists, who propose a commercial project more gigantic and extensive than any one this country has ever seen. The South will be the greatest beneficiary therefrom, but the result will be an enormous increase of export trade, both of mineral and agricultural resources, to all parts of the world. The scheme is briefly to open a water way to the Atlantic Ocean other than via Eads's jetties and the Gulf of Mexico. It will begin about 7 miles south of New Orleans, and will run thence to Pensacola, Fla., passing through Lake Borgne, going out along Mississippi Sound, passing Mobile Bay, and reaching Pensacola Bay, a distance of nearly 162 miles, almost the whole route of which is at present occupied by waters more or less adapted for canal purposes, and which route can be prepared at comparatively small outlay. For several years the project of a canal to connect the Atlantic coast with the Gulf of Mexico has engaged the attention of engineers of the United States, and its importance has been recognized by the Government, and a survey has been made of the proposed route and reported feasible. The Gulf of Mexico is the natural outlet for the larger proportion of the products of North America, for into it flows the Mississippi, the most important river in the world.

"The Mississippi Valley has an area of 1,683,303 square miles and drains an area exceeding by 459,114 square miles one-half the total area of the United States. It drains eighteen States and three Territories, and could contain Austria four times, Germany or Spain five times, France six times, the British Isles or Italy, and within its limits are grown 90 per cent. of Indian corn, 73 per cent. of wheat, 83 per cent. of oats, and 63 per cent. of the cotton produced in the United States, the weight of which alone is more than 60,000,000 tons. It is capable of producing food and clothing and of housing the population of the whole world, and if peopled as thickly as Belgium or the Netherlands, to say nothing of the Celestial Empire, it would contain 400,000,000 souls. Every part of this region is intersected by the Mississippi and its tributaries, which, from the source of the Missouri, its main branch, to the Gulf, is 4,300 miles, the longest river in the world. It carries with it to the Gulf the waters of fifty smaller rivers, all of which are navigable for boats, and there are hundreds of streams navigable by barges, making th total navigable length of the river and its tributaries 20,000 miles and pours as much water into the sea daily as the Thames does in a year. Now, the idea of the syndicate which I represent is that the water carriage of our freight should not be dependent upon New Orleans or any other city, and that the inadequacy of the Eads jetties and the Gulf of Mexico as suitable harbors and water ways is largely responsible for the decline of the river traffic of the United States and the decrease in our commercial growth abroad. Twenty-five years ago New Orleans showed that the total tonnage of vessels which entered her port from foreign countries was 659,000, and she was the third port in the United States, pressing Boston closely for second place, but since that time she has grad-

ually lost her trade and to-day occupies only the sixth place as a seaport town of the United States. The great East and West trunk railroads have superseded the Mississippi in carrying the produce of the great central valley of the seaboard to the markets of Europe and South America. This effect, which would have have seemed impossible—for it is impossible usually for railroads to compete with rivers and canals—has been produced by several causes, not the least of which has been the difficulty of navigating the Mississippi from New Orleans to the Gulf. It is believed by scientists that the mouth of the river was once where Baton Rouge now is, and that the whole 200 miles between there and the Gulf has been deposited by the river. This has always been a troublesome barrier to commerce, and now we propose to remedy it by building what we call the Atlantic and Mississippi Canal."

THE LEVEES.

NUMBER OF ACRES SUBJECT TO OVERFLOW—FIRST LEVEE—SWAMP-LAND ACT—HOW THE LEVEES ARE BUILT—THEIR COST AND CONDITION—WHAT THE STATES OF LOUISIANA, MISSISSIPPI, AND ARKANSAS HAVE SPENT IN THE CONSTRUCTION OF LEVEES—CREVASSES—FLOODS OF 1828, 1844, 1849, 1850, 1858, 1862, 1867, 1874, 1882, AND 1884—LOSSES FROM OVERFLOWS—COST OF HIGH WATER.

What are the number of acres subject to overflow by the Mississippi River in each State between Saint Louis and the Gulf were it not for the levees, including that now subject to overflow for want of artificial barriers?

The delta or alluvial lands of the Mississippi are subject to overflow unless protected by dikes or levees, the name originally given to these embankments of earth by the French or creole settlers of Louisiana. This delta includes portions of seven States—Illinois, Missouri, Kentucky, Tennessee, Arkansas, Mississippi, and Louisiana. It is calculated by the Mississippi River Commission to contain 29,790 square miles or 19,065,600 acres, as follows:

Area of lands subject to overflow by Lower Mississippi River from head of St. Francis Basin to the Gulf of Mexico, arranged for basins and States.

[Compiled from the Alluvial Map of the Mississippi River Commission.]

Basin.	State.	Square miles.	Acres.
St. Francis Basin and Mississippi River front	Illinois	65	41,600
	Missouri	2,874	1,839,360
	Kentucky	125	80,000
	Tennessee	426	272,640
	Arkansas	3,216	2,058,240
White and Arkansas fronts	do	956	611,840
Yazoo basin	Tennessee	27	17,280
	Mississippi	6,621	4,237,440
Macon, Boeuf, and Tensas basins	Arkansas	480	307,200
	Mississippi	305	195,200
	Louisiana	4,475	2,864,000
Atchafalaya basin	do	6,195	3,964,800
Pontchartrain basin	do	2,001	1,280,640
La Fourche basin	do	2,024	1,295,360
Total		29,790	19,065,600

BY STATES.

States.	Square miles.	Acres.
Illinois	65	41,600
Missouri	2,874	1,839,360
Kentucky	125	80,000
Tennessee	453	289,920
Arkansas	4,652	2,977,280
Mississippi	6,926	4,432,640
Louisiana	14,695	9,404,800
	29,790	19,065,600

This is twice as large as the Kingdom of the Netherlands, twice as large as Switzerland, larger than many of the historic states of Europe, and larger than the combined areas of Vermont, Massachusetts, Rhode Island, and Connnecticut. It is seven times as great as the arable lands of Egypt now or at any former period of its history.

The first advent of the white man into the Mississippi Valley showed the necessity for levees or dikes of earth-work to prevent the low bottoms on both sides of the river from being overflowed. Lasalle found the banks under water at several points when he came down the river in 1684, and Bienville in his exploring expeditions similarly found them overflowed.

At several points on or near the river were mounds erected by the Indians presumedly as a refuge from extraordinary high water. One of the highest points encountered by Bienville during his explorations of the Mississippi in 1699–1700 was New Orleans. The Metaerie ridge which runs back of the city rises from 6 to 7 feet higher than the surrounding country, and the front land facing on the river, especially that extending from Bayou St. John forward, is high enough to escape the flood in ordinary years. It is to this fact that the selection of this location as the future capitol of Louisiana was due. Seeing that the land here was out of water when nearly all the surrounding country was flooded, Bienville came to the conclusion that it was above overflow and selected it for the city which he had then in view.

The flood that he saw, however, was but a small one, the river not rising its usual height that year.

THE FIRST LEVEE.

The water of 1718 was much higher and interfered seriously with the men employed in laying the foundations of New Orleans, they being compelled by it to stop work and to devote themselves to the construction of a rude levee in front of the town and for some short distance above it, which sufficed to keep it clear of water. This was the first levee in Louisiana, and was constructed under the auspices of Sieur Le Blond de la Tour, chief of engineers of the colony and a Knight of St. Louis. This levee was merely a temporary one, but answered its purpose. It was worked on each successive year, raised and strengthened from time to time, being finally completed under Perrier in 1727. It then presented an 18-foot crown and 60-foot base, and was 5,400 feet, or slightly over a mile, in length. This was more than the city front, and was ample protection to it. Above the city for 18 miles a smaller levee was continued, and another extended 14 miles below, both for the protection of farmers and of the city.

The country around New Orleans was settled, levees were constructed, and by 1735 they extended a distance of 42 miles, from English Turn, "*Détour des Anglais*" to 30 miles above the city. With the exception of the New Orleans levee, however, they were low and weak and fell an easy victim to the great flood of that year, which lasted from the latter part of December to the end of June, 1736. The levees were broken in many places and New Orleans flooded from the crevasses above. The overflow caused great loss and damage and prevented the planting of much of the land, as the water did not go down until so late a day. The levees were patched up, but so little was done towards properly restoring them and crevassses continued so frequent that the government took the matter in hand and issued an edict requiring the owners of land fronting on the river, and all the properties in the colony so fronted, to improve their levees and have them in good condition by January 1, 1744, under penalty of confiscation. This stringent law seems to have accomplished its purpose, and for the next half century Louisiana escaped with comparatively little damage from overflow, and the levees were gradually extended and became the basis of the present levee system of the Lower Mississippi Valley—indeed, it is possible that some of them exist to this day in those sections where there has been little change in the course of the river.

In 1752 the levees extended along the river front 20 miles below and 30 above New Orleans, from Concession to near Bonnet Carre. The levee system was excellent, and no breaks occurred; and however defective the government of the colony may have been in other matters at that time, when it passed through many financial depressions, there could be no doubt of the efficiency with which it guarded the levees. These were constructed by the inhabitants themselves, but the government reserved a supervisory power, and allowed no planter to neglect his embankment and endanger the safety of his neighbors. All the land protected by levees was under a high state of cultivation, and nearly the entire population of the colony was concentrated in this narrow limit of less than 200 square miles. The cost of levee building was relatively higher than it is now, the planter, having no facilities for this work; this caused the slow settlement of the country, as the expense of protecting new land from overflow was many times greater than the cost of buying and stocking it. The levee, however, continued to advance slowly northward at the

rate of a mile a year. In 1782, 1785, and 1796 the river rose to a very great height, but the people escaped any serious damage from overflow. There were slight crevasses, it is true, and in 1780, 1785, 1791 and 1799 New Orleans was flooded from them. The last overflow, which was the worst, being a break in the Macarté Levee, just above the then city limits, but at what is now known as Carrollton, or the seventh municipal district of New Orleans. But little injury was caused by these breaks, as the levees were soon repaired. The districts not protected by levees suffered severely.

The flood of 1782 was the greatest ever encountered during the century in which Louisiana had been settled, and the water from the Mississippi overflowed the entire Attakapas and Opelousas regions, including all the country west of the Mississippi to the central prairies, only a few high points escaping.

In 1785 some of the lower levees were slightly injured, but no great harm done.

This experience firmly convinced the inhabitants of the efficacy of levees, and the work of building them was energetically continued. In 1812 they extended, on the east bank of the river, from Pointe a la Hache to Bayou Manchac, the dividing line between Louisiana and West Florida, a distance of 155 miles; and on the west bank from the lower Plaquemines settlement to Pointe Coupée, a distance of 185 miles. There were also a few levees on the west bank of the river, between the mouths of the Red and Arkansas Rivers, to protect the settlements. The total length of levees in 1812, therefore, was 340 miles, which, at the then cost of labor, most of it being slave labor, must have cost some $6,500,000, a very heavy expense for so young a country.

But little had been done in the way of levee building in the neighboring Territory of Mississippi. In 1809, when the river rose, it swept over all the country around Natchez, which section then contained more than half the population of the Territory, and destroyed the crops. Governor Sargent, in his notes, declares that the inhabitants, who could not understand the flood, entertained the belief that the Great Lakes had forced an outlet into the Upper Mississippi and were pouring down on them. In 1813 came the first serious disaster to the Louisiana levees in the breaking of that at Pointe Coupée, since known as the Grand levee, and which protects seven parishes from overflow. This levee, which is the largest, the most important, and the most exposed in the State, has broken several times, each time causing great damage, as it overflows the basins of the Atchafalaya, Bayou Teche, and Grand Lake. In this year (1813) the water in Grand Lake rose from 4 to 5 feet higher than any previous year it had attained since 1780. There were a number of minor breaks in the river embankment from Concordia down, and even New Orleans suffered slightly from a cave in the Kenner levee, 12 miles above the city.

In 1816 followed a notable overflow, restricted, however, almost wholly to the city. The Macarté levee, which was undermined by the powerful current which there strikes the bank, again broke, and four days afterwards the rear portion of the suburbs or faubourgs, as they were called, of Montagu, La Course, Gravier, Trémé, Saint John, and Saint Mary were flooded to a depth of from 3 to 5 feet. Within twenty-five days, however, the water had run off, and all damages had been repaired.

In 1828 the line of levees along the Mississippi was continuous, except where they were not needed, from New Orleans to Red River Landing, just below the mouth of Red River, a distance of 195 miles, and for 65 miles below the city. Above Red River they were in an unfinished state to Napoleon. From 1828 to 1844 they were gradually extended on the west bank from Red River to the mouth of the Arkansas. There were also many levees along the Yazoo front, but they were not continuous. Above Napoleon little, if anything, had been done in the way of levee building.

THE SWAMP-LAND ACT.

The Memphis river convention of 1845 made an earnest demand on the Federal Government to grant the farmers some assistance in the matter of levee building, without which, it was declared, the settlement of the Lower Mississippi Valley could not go on successfully. The planters had already expended many millions in constructing miles of dikes; and it was pointed out that with more levees millions of acres of fertile lands, then useless and valueless, because subject to overflow, could be reclaimed. The proposition was made that these flooded lands should be given to the States to aid in levee building and in reclaiming them; and this was warmly approved by the convention and recommended to Congress.

The convention was not without its effect. The improvement of the Mississippi received the attention of Congress, and a resolution was adopted authorizing a survey of the Mississippi for the purpose of ascertaining the best method of reclaiming the alluvial lands. The same year Congress gave, for the first time, assistance in the construction of levees. An act was passed in 1849 donating to Louisiana to "aid in con-

structing the necessary levees and drains to reclaim the swamps and overflowed lands there, the whole of these swamps and overflowed lands which may be, or are, found unfit for cultivation."

The General Government, in the spirit of enlarged public policy, conceded this class of inundated lands to aid in the construction of permanent levees, with a view to secure private property, the theory being reclamation of the land through the State and also as a sanitary measure.

Then followed the law of September 28, 1850, extending grant so as to enable "the State of Arkansas to construct the necessary levees and drains to reclaim the swamps and overflowed lands thereon, the fourth and last section of which enlarged the grant so as to embrace in each of the other States in the Union on which such swamps and overflowed lands, known and designated as aforesaid, may be situated." The act provided that "the proceeds of said lands, whether from sale or direct appropriation in kind, shall be applied, exclusively, as far as necessary, to the reclaiming of said lands by means of levees and drains."

Among the largest recipients of this bounty were the three river States of Louisiana Arkansas, and Mississippi, which have received 18,545,270 acres of swamp and overflowed lands.

The funds from the sale of these lands have been generally turned over to boards of swamp commissioners, to be used by them on levee building. Of the States Louisiana has secured the best results from this donation. It is still possessed of considerable revenue from this source, and the Morganza levee in Pointe Coupée was constructed in 1883 out of the funds derived from the sale of swamp lands.

The assistance thus given by the Federal Government encouraged levee building, and the next ten years were the most active and successful in the Lower Mississippi Valley. At the outbreak of the war, Louisiana, Mississippi, and Arkansas had a perfect system of levees. In 1860 there were 2,184 miles of embankments on the Mississippi, with an average height of from 8 to 10 feet and a width, at the base, of from 50 to 75 feet, their width at the top being somewhat less than their height. Some of them were of much greater size. That at Yazoo Pass, cut by the Union forces during the siege of Vicksburg, was, for a distance of half a mile, 28 feet high and at some points 38 feet, and in places nearly if not quite 300 feet broad at its base. The levees at Bayou Manchac and the Grand Levee in Pointee Coupée were nearly as large.

HOW THE LEVEES WERE BUILT.

Under the French rule, and for a long period afterwards, the levees were built and kept in order by the front proprietors. At a later date the police juné, corresponding to the county commissioners in the other States, took charge of the levees in Louisiana; but in times of danger the riparian proprietors, occupying alluvial lands subject to overflow within 7 miles of the river, were compelled to lend a helping hand. When a crevasse was threatened the planters and farmers of the surrounding country met and decided on the line of action to be pursued. Each gave the labor of a number of his slaves. One would give ten slaves for twenty days or less, another thirty slaves for fifteen days, each in accordance with his means. Afterwards districts were formed and taxes levied for levee purposes.

In Mississippi the levees were placed in charge of the board of swamp commissioners, who expended the money derived from the sale of the lands granted by Congress. Here also, however, the bulk of the work was done by the owners of the plantations fronting on the river.

In Arkansas, immediately after the grant of the swamp and overflowed lands by the General Government, a board of commissioners was created to determine the necessary drains and the levees to be erected. This board was abolished in 1856, and in 1857 an act was passed allowing the letting out of contracts for building levees when there was sufficient money in the treasury to pay for it. The funds becoming exhausted, the counties made their own laws respecting these dikes.

THE COST OF THE LEVEES.

In view of the manner in which the work on the levees was done—mainly by slave labor—it is somewhat difficult to arrive at a calculation of the cost of these dikes previous to the war. Various estimates have been made of the number of cubic yards of earth in the levees then constructed, and the cost is calculated on this basis. The State engineer estimated that the levees standing in Louisiana in 1860 cost $12,500,000. This represented their actual value, the number of cubic yards of earth in them, at the

price then ruling. Another report places the total cost of levees in all the river States, from the beginning of levee building to 1862, as follows:

Louisiana	$25,600,000
Mississippi	14,750,000
Arkansas	1,200,000
Missouri	1,640,000
Other States	560,000
Total	43,750,000

Work was begun anew. In Arkansas and Mississippi large amounts of bonds were voted for levee purposes. In Louisiana a levee company was formed, to which was confided the absolute control of the construction of all levees in the State until 1892, a tax of 2 mills on the dollar being voted for the purpose of raising the necessary funds. The tax was subsequently increased to 4 mills, and then dropped again to 3. The company was to build at least 3,000,000 cubic yards a year, at 50 and 60 cents per cubic yard, which would have made the annual expense for levees $1,650,000. In 1876 the chief engineer of the State reported that the work done by the company for the previous three years had not been sufficient to replace the wear and tear of the levees, and that they were losing ground every year.

CONDITION OF THE LEVEES.

The condition of the levees on the Mississippi was tabulated as follows by the Mississippi River Commission just before the beginning of the great flood of 1882:

Location.	Miles built.		
	Distance.	Right bank.	Left bank.
Forts to New Orleans	70	70	70
New Orleans to Baton Rouge	132	132	132

Total from 1866 to June 29, 1887.	32,659,365	$41\frac{23}{100}$	13,464,703.41	280,445.16	13,745,148.57

The period from 1871 to May 11, 1877, was that covered by the Levee Company. Since then the work has been done by the State board of engineers, under the direction of the governor, and the boards of levee commissioners of the several districts.

With the improved methods now used in levee building the expense has steadily decreased from $73\frac{2}{5}$ cents per cubic yard in 1867 to $19\frac{1}{5}$ cents during the past year.

These statistics represent the amount expended by the State and the levee districts, of which there are six principal ones, besides several subdistricts. The amount in the fifth column represents the money expended under extraordinary circumstances to stop breaks that have occurred or to work on crevasses.

The levee fund of Louisiana is provided by a 1-mill State tax and by the sale of the swamp lands voted to the State by the Federal Government. The districts are also allowed to tax themselves 5 mills for levee purposes, and have availed themselves of the full extent of their powers for several years. The Tensas levee district, created by an act of the last legislature, is allowed to issue bonds for the purpose of levee building and to lay a tax on lands and on crops—so much for each bale of cotton and bushel of corn raised in the region subject to overflow and protected by the levees.

In addition to the money provided by the State and the levee districts, some of the parishes have taxed themselves for levee purposes. Those railroads, moreover, subject to inundation have contributed toward the levees, notably the Louisville, New Orleans and Texas Pacific, which gave a large sum for the construction of the great Bonnet Carré dike.

The statistics of the amount thus expended by the railroads, parishes, and planters are not complete. The State board of engineers attempted to collect such information in 1882 and 1886, and secured the following from ten of the twenty river parishes:

Given for levee building in 1882, 1883, and 1884:

By railroads	$99,430.00
By parishes	141,751.27
By planters and others	69,414.88

For the years 1885 and 1886 the amounts thus raised were:

By railroads	$463,080.54
By parishes	212,692.85
By individuals	10,410.53

This was for eleven parishes.

Total expended from January, 1882, to April 20, 1886, was:

By railroads	$162,510.54
By parishes	354,444.12
By individuals	79,825.41
Total	596,780.17

Estimated for other parishes, $203,500.

Total amount, partly estimated, given for levees other than by State and districts, $800,280.17.

Amount expended on levees in Louisiana since 1866:

By State and levee districts	$13,745,148.57
By Federal Government	1,342,807.00
By parishes, railroads, and planters	800,280.17
Total	15,888,235.74
Amount estimated as spent previously	25,600,000.00
Total cost of levees in Louisiana	41,488,235.74

The activity in levee building in Louisiana and Mississippi since the great flood of 1882, when the necessity of levees was made so conspicuous, has given these States nearly complete systems and their levees are in decidedly better condition than they have been since 1861.

CONDITION OF LOUISIANA LEVEES TO-DAY.

In their report of April 21, 1886, the board of State engineers of Louisiana gave the amount expended on levees during the two previous years as follows:

The construction of about 47 miles of new embankment, besides the enlargement and raising of about 16 miles of old levee. The total amount of earthwork executed under these contracts is estimated at 2,555,818 cubic yards, and the cost at $405,405.59.

Other expenditures incurred under special acts of the legislature, $60,089.21.

The completion of works under contract previously made but not finished at the date of last report, 647,811 cubic yards of earthwork, at a cost of $152,998.84.

Entire amount expended by State for the construction of 3,203,629 cubic yards of earthwork, $717,493.74.

Expended by the Federal Government for levees in Louisiana, $210,000 and $25,000 on the Opossum Fork levee, in Arkansas,

The principal lines of continuous levees in the State to-day are as follows:

(1) On the right bank of the Mississippi, from the Arkansas line to Diamond Island Bend, about 93 miles.

(2) Right bank of the Mississippi, from a point on Bayou Vidal, in Tensas Parish, about 3 miles back of New Carthage, to Bourgere's Landing, in Concordia Parish, about 120 miles.

(3) Left bank of the Atchafalaya and right bank of the Mississippi, from a point about 10 miles below the head of the Atchafalaya to a point on the La Fourche, 80 miles below Donaldsonville, 215 miles.

(4) Left bank of Bayou La Fourche and right bank of the Mississippi, from a point on the La Fourche, say 80 miles below Donaldsonville, to Fort Jackson, about 233 miles.

(5) Left bank of the Mississippi, from Baton Rouge to Fort Saint Philip, about 205 miles.

(6) On the left Bank of Red River, from a point near Benton, in Bossier Parish, extending down the river a distance of about 29 miles.

(7) Right bank of Red River, from Bayou Rapides, at Alexandria, to a point near Bayou Choctaw, in Avoyelles Parish, about 32 miles.

On both banks of the Atchafalaya and the right bank of Bayou des Glaizes, in Pointe Coupée, Saint Landry, and Avoyelles Parishes; on the right bank of Red River, in Caddo Parish; on the left bank of the Ouachita, in Caldwell and Ouachita Parishes; on the left banks of Black and Tensas River, in Concordia Parish; and on the right bank of Roundaway Bayou, in Madison Parish, there are also considerable stretches of continuous levees; but in these localities not much has been done of late years and their levees have never had such unbroken lengths of line as those on the Mississippi and La Fourche.

The only breaks in the Louisiana line of the Mississippi River levees are, therefore, those at Diamond Island and Bourgere's, just above the mouth of Red River, both old openings.

The contract for closing Diamond Island Bend was granted by the State of Louisiana and the fifth levee district in September, 1887, and work was begun on it. By high water next year every break in the Louisiana levees along the Mississippi will be closed except that at Bougères, which break is of little importance. The water at this point rushes from the Mississippi into Red River, and is carried by the latter stream back into the Mississippi again only a few miles lower down.

The Board of State Engineers of Louisiana, in their latest report to the governor of the condition of the State levees, says:

"Considered as a whole, our levees are undoubtedly higher, stronger, and better than they have ever been at any time within the past twenty-five years, and the present sit-

uation and prospect, as compared with that of two years ago, affords good reason for satisfaction and encouragement."

The great difficulty encountered is the constant changing of the river-bed and the frequent caving in of the levees. Chief Engineer Richardson estimates that 75 per cent. of the cost of levee work in Louisiana is on account of the changes of the river and the caving of the banks.

LEVEES IN MISSISSIPPI.

The levee system of Mississippi dates from 1840. There were levees previously in that State, especially in the Natchez district; but the Yazoo delta, the most important region to be leveed, had received no attention. The flood of 1842 showed the necessity of concert of action on the part of the planters scattered along the Mississippi, the Yazoo or its tributaries to strengthen and join their fragments of levees to keep out the spring floods. There was then no continuous line of embankment anywhere. Each plantation had its front levee, which protected it in case of an average flood; but in very high water it was of no benefit, the places flooding from the rear water. The effort made by the planters was supplemented later by the board of supervisors of the different counties, levying a tax and taking charge of these levees as public works. The flood of 1858 made it necessary to enlarge and consolidate the levees, and a district was accordingly established, comprising the whole Yazoo delta, and taxes provided for it, Prentiss, in Bolivar County, being the meeting place of the board. Under this board was built the system of levees which, when the war began, presented a connected and unyielding front to the great flood of that year—1861—and the still greater flood of 1862. Breaches by caving and by abrasion, the absence of repairs during the war, and the cutting of the levees by the Federal troops, gradually destroyed this levee, and in 1865 the work had to be done over again.

At the first legislative session after peace in 1865, the Board of Levee Commissioners of the Yazoo-Mississippi Delta district was incorporated with the counties of Bolivar, Issaquena, and Washington, and the task of reconstructing the 200 miles of levee along their front was begun. Under this act, levee-building in Mississippi has been since and is today conducted.

Ample provisions were made for taxation upon lands and cotton, and arbitrary powers were conferred upon the board of commissioners. The greatest difficulty encountered was the want of credit. The $1,000,000 of bonds authorized to be issued by the board were negotiated at a great sacrifice and the levee work undertaken at war prices.

Levees, however, were built and strengthened, and the bonded debt greatly reduced. Prior to 1874 this reduction and levee-building was effected under a most extravagant administration and at a ruinous rate of taxation—$4 per bale on cotton, 10 cents an acre on land, and 15 mills ad valorem on all property, real and personal. And while this as a levee-construction tax was being paid, the old ante-bellum levee indebtedness, of over $1,000,000, had to be met by an additional tax, upon the front counties of 5, and the back counties of 3 cents per acre, on all lands. This debt has been liquidated in full, principal and interest. In 1875 the indebtedness of the district was $450,000. In 1882 this had been entirely paid off, the cotton tax reduced to $1 per bale, the acreage tax abolished, and the ad valorem tax reduced from 15 to 5 mills. The levees in the mean time had been greatly enlarged and strengthened.

In 1882 came the greatest overflow known in the Mississippi Valley since it was first visited by the white man. Great destruction befell the levees which had been constructed at so much cost, and for a brief time there was much despondency. But this flood passed away, the General Government granted liberal aid, and the levees were rebuilt larger and stronger than ever. And the floods of 1883 and 1884, which have wrecked the levees of other sections of the great valley, have left those of the "Mississippi Levee District" comparatively unscathed. This rebuilding and strengthening of the levees placed upon the district an indebtedness of $300,000.

Certain sections of the line of levees fronting and protecting this district are of immense proportions. That at Lake Bolivar, which protects especially the far-famed cotton garden, the Deer Creek country, has been one of the most costly, as well as the most difficult of construction, not only in this district, but in the Mississippi Valley. In a length of 1,600 feet is contained about 200,000 cubic yards of earth, chiefly upon a willow mattress. The maximum height is 25 feet, with slopes of 6 to 1; base, 300 feet. This massive work was completed in 1882 at a cost, including subsequent repairs and additions, of $100,000, and has successfully stood the high waters of the two succeeding years.

Hushpuckana, at the head of the Hushpuckana Bayou, or the west fork of the Sunflower River, is also an unusually large work. It was completed in 1870, and for a portion of its line is over 40 feet high, with a base of 280 feet. The main portion of this levee has not been broken since it was built in 1870.

Several attempts made to get the other counties of the Yazoo Delta into a levee district failed. This was finally done in 1871, after which these counties relapsed into absolute inaction for thirteen years. There remained, as a consequence, large gaps in the river fronts of De Soto, Tunica, and Coahoma Counties, which increased from year to year; this necessitated the levee district extending its levees into Coahoma County, including Hushpuckana, for the protection of the northern portion of Bolivar. Notwithstanding the work thus done, the water pouring into the counties north of Bolivar annually overflowed large sections of the lower country, and prevented clearing and permanent improvement.

The cost of levee building in Mississippi has been increased by the fact that the district secured the money by the issuing of bonds, on which it had to pay a large amount of interest. Between 1865 and 1884 the Mississippi levee district No. 1 had issued $2,075,823 of bonds.

The following statement of its expenditures from its organization, in 1865, to April 1, 1884, shows how large a proportion of the levee revenue went, not in the actual construction of dikes, but in interest, commissions, etc.:

How expended—	Amount.	How expended—	Amount.
Coahoma County graduation	$283,094.81	Convict labor	$12,120.00
Bolivar County graduation	954,838.24	Rights of way	64,619.73
Washington County graduation	518,836.57	High-water accounts	108,566.11

By the United States Government	.....	1,213,399	.....	.....	.....	.....	.....	347,294.41
Totals	136,000	5,196,194	310,408	562.35	264.02	279.05	2.888,513	1,240,170.16

Cash receipts from January 14, 1876, to April 1, 1884 ..... $2,287,681.55
Disbursements for same time 2,261,113.21

The success of the Yazoo Delta district induced the people of the counties above it to apply to the legislature for incorporation into a similar district with the power to issue bonds and raise money by taxation. The board organized April 16, 1884. It issued

$900,000 in bonds, which were negotiated at an excellent figure. The total amount expended for levee construction between April 16, 1884, and June 1, 1887, was $876,811.77; for engineering expenses, $50,772.31; for high-water expenses, $31,127.12, making, with other sums, the total disbursements for the care and maintenance of the levees, $1,199,146.59.

The counties included in the district are Coahoma, De Soto, Le Flore, Quitman, Sunflower, Tallahatchie, Tunica, and Yazoo.

The revenues from June 1, 1886, to May 31, 1887 (one year), were:

Levee taxes	$108,870.75
Privilege taxes	6,744.36
Tax sales and redemptions	935.01
Total	116,550.12

When the board of commissioners was organized, there were 93 miles of actual gaps in the line, and the remainder was generally very deficient in elevation. It was estimated that to complete a line 93 miles long and the proper standard in height 4,200,000 cubic yards would be required. Of this 3,900,000 cubic yards have been constructed. The district, however, has an additional levee of 16 miles on its hands which formerly belonged to the lower district, and which will require about 550,000 cubic yards. It has constructed 3,900,000 cubic yards out of 4,750,000 required to be done—more than four-fifths of the total work.

The Mississippi system of levees may therefore be said to be nearly complete, the total breaks in the system being only a few miles. The Mississippi River Commission in June, 1887, voted $60,000 towards the Yazoo-Mississippi district, which will go largely towards reducing the breaks in its line of levees.

Amount expended on levees in Mississippi.

Mississippi levee district No. 1 and Yazoo-Mississippi Delta levee district No. 2	$5,847,004.70
By counties, planters, railroads, and others (estimated)	800,000.00
By Federal Government	624,678.00
Total expended since the war	7,271,682.70
Amount estimated as spent previous to the war	14,750,000.00
Grand total	22,021,682.70

ARKANSAS LEVEES.

Of the lower river States Arkansas has done least as yet for its levees. Before the war its dikes were constructed under the auspices and supervison of the swamp-land commissioners and afterwards by the counties. During the period immediately following, a considerable amount of levee bonds was issued, but very little work was done. Since then, the few levees constructed were built by private enterprise. Planters in Chicot and Desha Counties, in the southeastern portion of the State, in co-operation with the State of Louisiana, erected the Possum Fork Levee, which protected a large area of both Arkansas and Louisiana from overflow.

At the last session of the legislature the cotton belt levee district was created, including the country around Helena; to this district $75,000 has been voted by the river commission for levees, on the understanding that $50,000 is to be raised by the people of the district, which amount has been guarantied.

Expenditures for levees since 1866.

Louisiana:	
State and levee districts	$13,745,148.57
Parishes, municipalities, railroads, planters, and others	800,280.17
Mississippi:	
State and levee districts	5,847,004.70
Counties, municipalities, railroads, planters, and others	800,000.00
Arkansas:	
State, districts, counties, municipalities, etc	1,575,000.00
Planters, railroads, and others	375,000.00
Total by States	23,142,433.44

Of which there was given, by—	
Louisiana	$14,545,428.74
Mississippi	6,647,004.70
Arkansas	1,950,000.00
And by the Federal Government	2,562,049.00
Making a total spent on levees from 1866 to 1887, twenty-one years and a half	25,704,482.44
Estimated amount expended on levees previously	43,750,000.00
Total cost of levees from Memphis down, from the earliest times to April, 1887	69,454,482.44

The Mississippi River Commission, after the flood of 1882, made the following estimate of the cost of putting the levees in complete order:

No.	Location.	Length.	Grade.	Contents.
		Miles.		*Cubic yards.*
1	Commerce, Mo., to Cairo	35	2 feet above high water, 1882	1,908,000
	Cairo to Island No. 40	220	do	11,989,000
3	Island No. 40 to mouth of Saint Francis River.	75	do	2,098,000
4	Helena to mouth of White River	80	do	1,000,000
5	Arkansas City to Louisiana line	90	3 feet above high water, 1882	2,903,000
6	Louisiana line to opposite Warrenton	100		3,426,080
7	Opposite Warrenton to Red River	150		5,140,000
8	Red River to forts below New Orleans.	279	2 feet above high water, 1882	6,652,000
9	Horn Lake to Friar's Point	70	do	1,276,000
10	Friar's Point to Sunflower	34	do	620,000
11	Sunflower to mouth of Yazoo River	220	3 feet above high water, 1882	3,925,000
12	Baton Rouge to forts below New Orleans.	200	2 feet above high water, 1882	4,838,000
				45,775,080
	Cost at 25 cents per cubic yard			$11,443,770

Much work has been done on the Louisiana and Mississippi levees since then, and the amount estimated as then necessary to put the levees in good condition is more than is required to-day

CREVASSES.

Despite all this work, however, the Lower Mississippi Valley has suffered severely from floods and crevasses due to defective levees, to crawfish or rat holes, to rotten or defective rice flumes, to caving banks, storms, or other causes. Besides these crevasses already noted in the early history of levees, the following are the more important and destructive of the past half century:

Flood of 1828.—This flood occurred before the country above Red River Landing was much settled, and it is probable that its marks have been confounded with those of 1815 in many localities. The Saint Francis and Yazoo bottoms were deeply inundated, being entirely unprotected by levees.

Relative to this flood in the Tensas bottom, it was the highest of which we have even traditions. The whole region was under water. In the western part of the Atchafalaya basin the flood was the greatest of which we have record, there being no levees for several miles below the mouth of Red River. The overflow extended to the extreme western limit of the alluvial formation, instead of only 6 to 8 miles from Bayou Atchafalaya, as in ordinary floods. The plantations along the upper part of the Teche were not flooded, but the crops were lost on those within the influence of the backwater from the Atchafalaya overflow.

The eastern part of the Atchafalaya basin, indeed, the whole region bordering upon the Mississippi below the head of this basin, seems to have nearly escaped damage, the only exception being the Grosse Tête region, which was deeply flooded by backwater from the Atchafalaya overflow and by a break in the Grand Levee of the parish of Pointe Coupée, near Morganza.

Flood of 1844.—A considerable rise occurred in April from a freshet in Arkansas River. In May, however, before the lower river had subsided, another and much greater flood in the Arkansas occurred. Above the mouth of the Red River the country was more or less flooded, but Red River, being fortunately low, the Atchafalaya carried off enough water to protect the plantations below the mouth of that stream from serious damage.

This was the condition of the river in June when the great combined flood of the Upper Mississippi and the Missouri, which has rendered this year memorable in river annals, occurred.

The country above the mouth of the Red River was generally flooded. The St. Francis and Yazoo bottoms were nearly unprotected by levees and the water had free entrance. The Tensas bottom was badly inundated through breaks in the levees. Below the Red River Landing the country escaped with but little injury, owing to the very low stage of the Red River, which allowed the Atchafalaya to carry off the greater part of the surplus discharge of the Mississippi.

Flood of 1849.—The gauge at Carrollton indicates that the river rose nearly to high-water mark in the latter part of January, and remained there with occasional oscillations until the middle of May.

Above Red River Landing the ravages occasioned by this flood were comparatively slight.

The St. Francis and Yazoo bottoms were inundated, but to an extent not unusual for great flood years. Below Red River Landing the injury done was so immense that the flood is justly classed among the most destructive ever known. On April 7 a crevasse broke on the west bank, about 15 miles above New Orleans, at Fortier's plantation. This flooded the country between the Mississippi and the Bayou La Fourche to a depth of about 4 feet, and this submerged the rear of many rich sugar plantations. The effect of this crevasse upon the bed of the river has been much discussed. On the left bank a crevasse occurred on May 3, at Sauve's plantation, 17 miles above New Orleans, by which the city was inundated. The break remained open forty-eight days, and did an immense amount of damage.

Flood of 1850.—It appears that there were four principal rises this year, of which the first and second produced very little, if any, damage. The third was the highest, in the latter part of March, and the fourth, in the middle of May. The damage occasioned by this flood was immense. The Saint Francis and Yazoo bottoms were not protected by levees, and both were deeply flooded. The Tensas bottom was submerged more effectually than in any year subsequent to 1828. The principal breaks were above the Louisiana line, which flooded Bayou Macon.

The water rose steadily until March 15, then declined slowly until early in April, then rose again until the middle of May, when it attained its highest point, and then rapidly subsided. At the mouth of Black River, the flood was 3 feet above that of 1814 and 5 feet below that of 1828. It is needless to add that nearly the whole region was submerged and the crops destroyed. Below Red River Landing the country fared but little better.

The water pouring from Red River exceeded the discharging capacity of Bayou Atchafalaya, and the surplus forced its way into the Mississippi by both of the mouths of Old River. The flood from above, augmented by this new supply, maintained an elevation sufficient to keep the numerous crevasses below Red River Landing actively discharging for more than four months. The basin between Bayou La Fourche and the Mississippi escaped nearly uninjured.

The crops upon the left bank above New Orleans were much injured by the celebrated Bonnet Carré crevasse, which attained width of nearly 7,000 feet, and continued flowing for more than six months.

Flood of 1858.—In the flood of 1858 there were four great rises. The first, caused mainly by a flood in the Ohio, occurred in December, 1857. The second rise occurred in the latter part of March and the first part of April, 1858, and was caused by a general swelling of the lower tributaries of the Missouri, Upper Mississippi, and Ohio. The third great rise occurred in the latter part of April. The Tennessee was unusually high.

The last and greatest rise in the flood of 1858 occurred at the head of the alluvial regions in June. It inundated the city of Cairo. It washed away miles of levees along the Saint Francis front, and poured rapidly into the bottom lands of that river. In the White River swamps the same condition existed. The Yazoo and Tensas bottoms, on the contrary, were comparatively empty. The June rise terminated the flood.

Flood of 1862.—Beyond doubt this was one of the greatest floods which ever occurred on the Mississippi, but the war raging at the time has so obliterated all records that it must always remain classed with the traditional overflows of 1815 and 1825.

We know that there was a great flood in the Ohio River at Cincinnati, and also in the Cumberland some time in the spring of 1862, and a destructive overflow in the Wabash in February. At Cairo the highest water occurred May 2, and was 1.2 feet above the high water of 1858. It is believed that there was no flood in the Yazoo or Red Rivers at the date of the high water in 1862 (except water returning from the swamps), but the records are too defective to render this certain.

Flood of 1867.—In some respects its origin was peculiar. The heavy downfall of snow and rain in the Ohio Valley, a sudden thaw caused moderate floods in the Allegheny

and Monongahela Rivers and a great flood in the Wabash, the combined effects of which caused a sand rise in the Ohio.

At Helena the first rise culminated March 14, standing 1 foot above high water of 1858, and eighth-tenths of a foot below that of 1862.

The river then subsided about three-tenths of a foot, but again swelled to the highest point on April 1, being two-tenths of a foot above first rise. There was a moderate freshet in both the Arkansas and White Rivers; the Yazoo discharged a considerable volume; in the Red River there was a considerable flood in June, due chiefly from the Ouachita.

The Atchafalaya basin was deeply flooded through a break in the Grand levee near Morganza. The Teche country was under water. The actual water-mark of 1867 was, in general, a little higher than that of 1858.

Flood of 1874.—In February the rain-fall throughout the alluvial regions was not unusual, and the river was generally about at mid-stage.

In March heavy rains prevailed throughout the lowland below Cairo, thus filling the swamps and swamp-rivers, and rapidly raising the Mississippi. In April these rains became excessive, and extended eastward over the valley of the Tennessee and Cumberland Rivers. In Missouri the breaks were very numerous. Between Commerce, Mo. and the Louisiana line there were 136.5 miles of crevasses and breaks.

The flood of 1874 rose 1.2 feet higher at Helena than in 1858. There was no great flood, properly speaking, in the Arkansas River in 1874. In the White River, there was a destructive overflow. In the Yazoo, there was the largest freshet on record, due to rain-water alone. The combined rain and crevasse water in the Yazoo raised the Mississippi at Vicksburg 3 feet during the last three weeks of April. At Alexandria, the Red River rose 23 feet between February 1 and April 4.

In the Ouachita the greatest flood on record occurred. Bolivar County, Mississippi, suffered severely from a rise in the Arkansas and White Rivers in March. The bottom lands of the Tensas were flooded through the crevasses in Carroll Parish. The overflow of the Atchafalaya basin was extreme in this flood. Bayou Teche was deeply inundated from Saint Martinsville down. The Bonnet Carré crevasse raised Lake Pontchartrain suddenly about 2 feet.

The suffering in lower Louisiana this year was great. Hundreds of persons were actually in danger of starvation. Aid was asked for, and large sums of money were raised in New York, Boston, and other Northern cities and States for the benefit of those residing in the overflowed region in Louisiana. Boston alone contributed $230,000 to this fund.

Flood of 1882.—In the early part of the winter of 1881–'82, the river was unusually high, due to frequent rains that had fallen throughout the valley, but no grave apprehensions then existed of an overflow. At the beginning of the year, however, a series of rains commenced falling, which continued, without cessation, throughout the month, particularly in the valleys of the Ohio, Tennessee, and around Vicksburg. The smaller tributaries, the Clinch and others, in East Tennessee, overflowed their banks about the middle of January, and caused heavy damages to the farmers; the Cumberland rose rapidly at Nashville, flooding a large portion of the town on January 14, and causing much loss, particularly to the lumber interests, and much suffering among the poorer people of the city, 1,000 of whom living near the river were driven from their homes. Floods occurred also at Kosciusko, Miss., overflowing the Chicago, Saint Louis, and New Orleans Railroad at Aberdeen, and at various other points. The Ohio also began to boom about this time, flooding the lowlands between Cairo and Evansville, and drowning considerable quantities of stock. The rains continued to fall and the rivers to rise. On the 18th the Big Black was out of its banks, and communication between Memphis and the outside world was nearly severed by the freshets occurring in all the neighboring streams. The Atchafalaya overflowed its banks, causing a suspension of work on the New Orleans Pacific, and at Grenada and Durant, Miss., and on the Tombigbee and Warrior Rivers, in Alabama, serious floods were reported.

The situation now began to look threatening. Heavy rains were falling every day, and the river rising. A thorough inspection was made of the levees, and much work done on them. But the rain softened and washed away the dirt. On January 28, a break occurred in the levee at Delta, Madison Parish, and another at Tropical Bend, in Plaquemines Parish, below the city; on the 30th another break occurred at Lockport, on Bayou La Fourche. On February 2 Red River rose, flooding the bottom lands below Shreveport. On February 9 the levees in the Yazoo valley broke. From that time forward crevasses occurred daily.

On February 13, the Kempe levee, in Tensas Parish, broke. By the middle of February all the bottom lands in Mississippi, Arkansas, and much of northern Louisiana were under water.

On the 20th all the upper rivers, the Ohio, Missouri, and Mississippi suddenly rose, with a "boom" beyond all precedent. The lower portions of Cincinnati and Louis-

ville were flooded; Saint Louis was cut off from railroad communication with the rest of the world, and hardly a town on the Mississippi or Ohio escaped without some damage from the flood. The situation grew worse every day, and only a few points on the river between Vicksburg and Cairo were left above water. On March 1 occurred a violent storm, which caused a number of breaks in the Mississippi levees, inundating Bolivar, Issaquena, Sharkey, Leflore, and Washington Counties. At that date there were fifteen crevasses in Louisiana on the Mississippi, Atchafalaya, and La Fourche. Great destitution existed throughout the overflowed region, and appeals were made to the Government for aid from Illinois, Missouri, Tennessee, Arkansas, Louisiana, and Mississippi. The number of sufferers by the flood was then estimated at 43,000. On March 8, the Pointe Coupée levee was broken, and the scene of destruction was changed to Central Louisiana. Through these new breaks the water poured down the Atchafalaya and began overflowing the Attakapas district of Louisiana, and ruining the finest sugar plantations of the State.

The water on the land overflowed by the Mississippi began to run off during the last two weeks of March, but in lower Louisiana the flood rose and continued through the greater portion of April. Even when this rise stopped, the flood did not entirely subside. It was not until late in June that some of the plantations were free from overflow. The flood may, therefore, be considered to have lasted fully five months. Over a hundred breaks or crevasses were caused by it, and 22,000 square miles, with a population of over 400,000, were overflowed.

Early during the overflow the Government had established relief bureaus in the various inundated States, and several hundred thousand dollars were distributed in rations. This was supplemented by the State of Louisiana, which organized a relief commission and sent a fleet to upper Louisiana to remove the people in danger of overflow to safe land, and to furnish forage to the stock, which was being destroyed in thousands. This fleet rescued many people from starvation and drowning.

LOSSES FROM OVERFLOW.

An attempt was made to find accurately the losses from the flood in 1882. The police juries of Louisiana were requested by the governor to prepare reports on this subject, showing the land overflowed and the amount of damage done. For Mississippi and Arkansas estimates were made.

In Louisiana, 26 out of 58 parishes were overflowed either wholly or in part. The parishes suffering most were Morehouse, Ouachita, Caldwell, Richland, West Carroll, East Carroll, Madison, Tensas, Franklin, Catahoula, Concordia, Avoyelles, Rapides, Saint Landry, Pointe Coupée, West Baton Rouge, Saint Martin, Ibera, Iberville, Assumption, Saint Mary, Terre Bonne, La Fourche, Ascension, Saint Bernard, and East Baton Rouge.

In Mississippi, the counties suffering most were Tunica, Coahoma, Panola, Tallahatchie, Bolivar, Washington, Sunflower, Leflore, Yazoo, Issaquena, Warren, Claiborne, and Adams.

In Arkansas, Mississippi, Poinsett, Cross, Crittenden, Saint Francis, Woodruff, Monroe, Phillips, Arkansas, Desha, Chicot, Drew, Ashley, and Bradley Counties suffered.

The following estimates were made of the actual damage inflicted by the overflow.

Losses in Louisiana.

Crop.	Average crop.	Loss.	Acreage.	Per cent. of loss.	Value.
Cotton ..... bales...	171,750	42,280	229,000	32	$2,114,000
Corn ..... bushels...	2,800,000	560,000	140,000	20	504,000
Sugar ..... hogsheads...	73,300	65,970	77,000	90	6,286,000
Molasses ..... gallons...	4,984,000	4,285,000	.....		2,142,000
Other crops	.....	.....	52,000	.....	362,000
Total	.....	.....	.....	.....	11,408,000

Add to the total above	$11,408,000
Damage to—	
Stock	1,090,000
Fences, etc	530,000
Houses and household goods	685,000
Levees	561,000
Railroads	730,000
Total loss in Louisiana	15,004,000

Losses on Mississippi.

Crops.	Average crop.	Loss.	Acreage.	Per cent. of loss.	Value.
Cotton ..... bales...	220,000	61,000	256,000	28	$3,008,000
Corn ..... bushels...	2,352,000	570,400	112,000	20	481,000
Other crops	.....	.....	28,000	.....	100,000
Total	.....	.....	.....	.....	3,589,000

Add to the total above	$3,589,000
Damage to—	
Stock	1,312,000
Fences, etc	550,000
Houses and household goods	450,000
Levees	700,000
Railroads	100,000
Total loss in Mississippi	6,701,000

Losses in Arkansas.

Crop.	Average crop.	Loss.	Acreage.	Percentage of loss.	Value.
Cotton ..... bales...	133,000	33,300	190,000	25	$1,667,000
Corn ..... bushels...	1,848,000	369,600	96,000	20	296,000
Other crops	.....	.....	17,000	.....	50,000
Total	.....	.....	.....	.....	2,013,000

Damage to—	
Crops	$2,013,000
Stock	1,180,000
Fences	225,000
Houses and household goods	230,000
Levees	115,000
Railroads	320,000
Total loss in Arkansas	4,083,000

TOTAL LOSSES BY THE FLOOD.

Louisiana	$15,004,000
Mississippi	6,701,000
Arkansas	4,033,000
Tennessee and other States	1,300,000
Total	27,038,000

States.	Acreage under water.	Cultivated land under water, acres.	Population of overflowed districts.
Louisiana	6,056,000	498,000	142,900
Mississippi	3,495,000	392,000	123,800
Arkansas	3,907,000	303,000	74,600
Other States	625,000	84,000	62,800
Total	14,081,000	1,277,000	402,100

Flood of 1884.

The only important crevasse of 1884, but a very serious one, was that at the Davis plantation, 22 miles above New Orleans, one of the largest and most destructive known. A rice flume cut in the old levee had been imperfectly refilled and the great rush of the river washed out the loose earth, and soon cut a gap 1,000 feet wide. Through this immense opening the spare water of the mighty river forced its way, forming a converging stream that ran several miles inland, and pounding out deep gullies and holes here and there along its destructive course.

The railroad tracks of the Texas and Pacific and of the Morgan lines soon became submerged and all traffic stopped. The two railroad companies, in conjunction, undertook to close this tremendous crevasse, but the driftwood and débris of the river, together with the powerful current that was setting in against the work, so impeded, blocked, and prevented any available efforts that they were finally compelled to abandon the undertaking. The great gap then grew apace, the water spread out a vast sheet of demolition over the surrounding country, overflowing adjoining parishes, poured into the town of Gretna, submerging the streets, driving families from their homes, causing widespread misery, destruction, and suffering. The water poured down on the richest sugar district in the State, causing destruction on the west bank of the river almost to the Gulf, and entailing a loss of over $5,000,000.

High-water floods.

The following is the Mississippi River Commission's calculations of floods:

At Cairo, between 1862 and 1883, inclusive, four floods have reached or exceeded a reading on the gauge of 50.8 feet, the highest known reading being 52.4 feet, in 1883. A flood of 51.5 feet may then be looked for once in ten years.

At Memphis, between 1858 and 1883, inclusive, the gauge-reading has equaled or exceeded 34 feet six times, the highest reading being 35.1 feet, in 1882. A flood of 34.5 feet may be expected once in ten years.

At Helena, between 1867 and 1883, inclusive, floods have four times equaled or exceeded a gauge-reading of 45.8 feet, the maximum being 47.2 feet, in 1882. A flood of 46.5 feet may be expected once in ten years.

At the mouth of White River, between 1862 and 1883, inclusive, the floods have five times given a gauge-reading of 46.6 feet or more, the highest being 48.5 feet, in 1882. A flood of 47.5 feet may be expected once in ten years.

At Vicksburg, between 1858 and 1883, inclusive, floods have four times given gauge-readings of 48.8 feet or more, the highest being 51.1 feet, in 1862. In 1882 the flood only reached 48.8 feet, the maximum since 1867, and may have had its height diminished by the Vicksburg cut-off of 1876. A flood of 49 feet may be expected once in ten years.

At Natchez, between 1858 and 1883, floods reached a gauge-reading of 47.9 feet or more five times, the maximum being 50.3 feet, in 1862. A flood of 48 feet may be expected once in ten years.

At Red River Landing, between 1867 and 1883, the gauge has in three years had a flood reading of 46.3 feet or more, the maximum being 48.6 feet, in 1882. A flood of 47 feet may be expected once in ten years.

At Carrollton floods have reached a gauge-reading of 15.4 feet or more five times between 1859 and 1883, the highest being 15.9 feet in 1862. A flood of 15.6 feet may be expected once in ten years.

These statements refer to the river as it has been since 1858.

Cost of high water.

The total losses from overflow in the States south of Memphis since 1866 is estimated at $71,827,000, the worst years being 1867, 1874, 1882, and 1884.

The account of the Lower Mississippi Valley with the river since the war will stand as follows:

To the building and maintenance of levees	$25,704,482.94
To crevasse and losses from flood	71,827,600.00
Total cost of high water in twenty-one years	97,532,082.94

RIVER IMPROVEMENTS.

AMOUNTS EXPENDED BY UNITED STATES GOVERNMENT AND BY STATES AND MUNICIPALITIES.

10. *Give an account of the various schemes for the improvement of the navigation of the river between Memphis and the Gulf, and the amounts expended thereon by the United States, State, and the municipal governments separately.*

It is now recognized by the Mississippi River Commission that levees are an important factor in river improvement, and that whatever is done to restrain the volume of the river within its banks will enable it to cut out its channel and to give deeper water and better navigation. This doctrine was forcibly enunciated by the Commission in its first report, and it has since assisted liberally in the buliding of levees, recognizing them as important elements in river improvement. On this basis, therefore, the amount expended on levees by the several lower river States may be properly included among the expenditures for the improvement of navigation. They undoubtedly had that effect, as was well shown by the fact that in Louisiana, where the levees were maintained in the earliest day, the river was always deep and never troubled by bars, whereas above, there were frequent obstructions. As a matter of fact, however, these levees were erected with no expectation or intention of deepening the Mississippi, nor, indeed, with any idea that they had that effect. They were constructed wholly for defensive purposes to protect the land from overflow.

Later on, their importance in the scheme of river improvement was recognized by the State engineers, and the work of constructing them and deepening the river was carried on simultaneously and by the same boards as part of the same work.

The levee work done by the States has already been given. The other work carried on specifically for improving navigation and deepening the channel, and which served as the initiative of the present plan of river improvement, also deserves consideration.

The first trip made by Bienville up the Mississippi, in 1699, before a single settlement had been made on that stream, was attended by what may be called the improvement of the river. The French explorer found it running over a point at one place, where the channel was badly clogged with drift. He had his men to clear this away and allow the water to run through without hinderance. On his return he found the river rapidly adapting itself to the new channel, which ultimately became the main one.

The first work of the new settlers on the Mississippi in 1717 was to construct a levee for the purpose of protecting themselves from overflow, but without any idea of improving navigation.

The first regular river improvement was that attempted by the French Government in 1726, for the purpose of removing the bar from the mouth of the Mississippi, deepening its navigation, and allowing the easy entrance of its largest war vessels. At that time the Mississippi afforded a depth of only 6 or 8 feet, and while this was sufficient for the small vessels engaged in the colonial trade, it was not for the men-of-war seeking refuge in the river. The process adopted for removing the bar was one followed for many years afterward. It consisted simply in dragging iron harrows over the shallow places, stirring up the mud, which was carried away by the current. It was successful temporarily. The required depth was obtained, but it was only for a short time, and it had to be done over again repeatedly.

While some records exist of the work done on the levees under the French and Spanish régimes. there is very little said about river improvement. The only works undertaken were the leveeing of the banks, which had the effect of deepening the channel, the dredging at the bar to secure a better depth there, and the removal of snags and logs.

The Spanish Government, which devoted itself very assiduously to developing and improving the material resources of the country, cleared out the mouths of Bayous Manchac and La Fourche, and thus gave better connection between the Mississippi and these streams. As the clearing of the river banks gave a deep, navigable stream along all that portion of the Mississippi then settled (from Bayou Sara down), there was really nothing to be done save to keep the mouth of the river open and to clear it of floating drift. The first was done by the Government, the latter generally by the people, although once or twice officers assisted in removing a troublesome raft where the logs and timber piled up in large masses, affecting navigation more or less.

The cession of the country to the United States caused no change. Nothing was done for the specific purpose of river improvement, although that was incidentally obtained by the levees constructed. About the time of the battle of New Orleans an important work was performed in the construction, under the order of General Jackson, of a dike over Bayou Manchac. Bayou Manchac connects the Mississippi River with the Amite, or

Iberville, and Lake Pontchartrain and the Gulf, and is thus a short cut to the sea. It was frequently used for purposes of navigation during the early days of the colony, and it was by this route that Bienville and his men entered the river from the settlements on the Mississippi Sound coast, thus avoiding the danger of a trip through the Gulf and passes and up the river. General Jackson's purpose in closing the bayou was not river improvement, but military defense, as this route offered the British an easy entrance into the Mississippi above New Orleans. The work, however, in the view now taken of river improvements by the Mississippi River Commission was an important one, being the first step towards closing outlets and thus confining the Mississippi to a single channel and forcing it to cut out and deepen that channel.

The large number of people who about this time came pouring down the river from every portion of the upper country, but particularly from Kentucky, Tennessee, Virginia, and Pennsylvania, resulted in some improvement of the river, or rather in the removal of the obstructions in the way of logs, rafts, sawyers, etc., that had previously existed. The work was done altogether by the boatmen. The States did nothing, and the United States Government did not recognize its obligations in this matter until about 1829, when it inaugurated, under Captain Shreve, the snag-boat system. Previous to that time, the boatmen themselves had removed, in their passage down stream, the numerous logs which obstructed and rendered the navigation of the river dangerous. The settlers were everywhere felling the forests along its banks, rafts and logs were being floated down, barges and flat-boats sinking, and, as a consequence, the river was far more dangerous than to-day. When the first steam-boat, the *New Orleans*, contemplated making her trial trip to New Orleans, a special agent was sent ahead to examine the route and see what were the obstructions in the way and to remove them.

The snaggy condition of the Mississippi was such at the time that only three-fourths of the boats going down stream ever reached New Orleans, the others being shoaled or sunk on their way there. The losses were so heavy that the captains, pilots, and owners of river craft united in 1822 in a strong petition to Congress asking for the removal of snags. The petition received no attention for some years, but finally Congress recognized its obligations in the matter, and snag-boats were placed upon the river. Captain Shreve, who commanded the fleet, did good work. He invented a system of butting down the snags, and within a short time had cleared out the river. The work was one, however, that never had an end. New logs are constantly floating down, and the snagging branch of public service has ever since been fighting this danger, save during those few years when Congress failed to make an appropriation for it. Captain Shreve, who was one of the earliest river experts, followed his good work in the way of snag removal by a very unfortunate act. At that time, the general idea of river improvements was to shorten the river—smooth out the wrinkles, as it were. With this idea in view he inaugurated his grand scheme by what is now known as Shreve's Cut-off, cutting off a bend, and thus shortening the Mississippi some 12 or 15 miles. The evil effects of this act are felt to the present day. The State of Louisiana endeavored to offset it soon afterwards by making a second cut-off across Raccourci Point. While these cut-offs did not affect the Mississippi itself seriously, they ruined the entrance to the Red, Ouachita, and Atchafalaya Rivers, and have caused the expenditure since of hundreds of thousands of dollars to set right this ill-advised attempt at river improvement.

Cut-offs became fashionable, and all along the river attempts were made to divert it from its ordinary course. To such an extent was this carried in the mad scheme to improve the river in this way that the legislatures of Arkansas and Louisiana declared it a felony to make an artificial cut-off of this kind.

Within six years of the recognition by the Federal Government of its obligations to the river States in the way of at least removing the snags, Louisiana organized a similar service and assisted in the work, and Mississippi did something towards improving the navigation of those of its streams emptying into the Mississippi. Both States had received donations of lands from Congress for internal improvements, and the proceeds coming from the sale of these lands were expended equally in the construction of public roads and in river improvement.

This, however, was far from all that the river States desired in the matter, and an agitation was begun in favor of river improvement by the Federal Government. The subject was discussed in the Southern and Western press for some time, and finally culminated in a convention, one of the first of its kind in the country.

MEMPHIS RIVER IMPROVEMENT CONVENTION, 1845.

In 1845 the great river improvement convention met in the city of Memphis, or rather there were two conventions that year in that city. At the first six States were represented, at the second twelve States, with about 500 delegates, and the president no less a personage than Hon. John C. Calhoun. This was not called specifically in the in-

terest of the Mississippi River, but of internal improvements generally. In 1847 another river and harbor convention assembled at Chicago, at which were present many men who have since become noted in our country's history, as Abraham Lincoln, Charles Hempstead, Tom Corwin, Robert C. Schenck, Dudley Field, John C. Spencer, Horace Greeley, and many others. In 1851 a large convention was assembled at Burlington, Iowa, and was the initiative work in the improvement of the Rock Island and Des Moines Rapids of the Mississippi River. In 1866 another convention met at Dubuque, Iowa, and the following year witnessed another grand convention, and since that time there has scarcely a year passed that conventions have not been held at some of the principal cities in the valley of the Mississippi.

The four principal improvements demanded for the river were:

(1) The improvement of the passes so as to allow vessels of larger draught to reach New Orleans from the Gulf.

(2) The improvement of the channel of the river so as to make it navigable at all seasons of the year, particularly that portion of the river lying between Saint Louis and New Orleans, for which a depth of 8 feet is demanded.

(3) The removal of obstructions in the river and its tributaries, as, for instance, the Rock Island Rapids, the falls in the Ohio opposite Louisville, the raft in Red River, and similar obstructions to navigation.

(4) The prevention of overflows by crevasses, floods, and freshets, whereby the fertile alluvial lands lying on the banks of the river were injured and damaged, and the course of the river itself obstructed with bars, etc.

These demands have all been more or less recognized; indeed, before the convention had met, the Federal Government had already recognized its obligations to the country in the removal of snags and obstructions, and had had its snag-boats at work for some years, and had spent some money in surveys at the mouth of the river and in attempts to remove the bars there.

The necessity for the improvement of the passes was admitted from the earliest days. The French and Spanish Governments had worked at them on the system of stirring up the mud at the bottom. The United States followed with the same system, and the first work on the passes was an ingenious but unsuccessful attempt to secure deeper water by dredging with buckets, a plan recommended by the board of United States engineers.

The Mississippi River, at its mouth, is constantly changing and shifting. This is especially so of the passes. Since La Salle discovered the mouth of the river, two centuries ago, the deepest pass through which vessels plying to and from New Orleans have sailed, has changed no less than four times. In 1750 the Northeast Pass was the one chiefly in use. Since then Pass à Loutre, Southwest, and South Pass have been successively employed.

In 1835 Congress appropriated $250,000 for the work, that being the first sum ever given by it for this improvement. A survey of the work and preparation for the dredging apparatus, however, nearly exhausted the appropriation, and several years elapsed before anything more was attempted.

The deepest mouth of the river at that time was Northeast Pass, which showed a depth of 12 feet of water, a depth whose inadequacy for the commercial needs of a near future was overlooked. Vessels built expressly for the carrying trade between New York and New Orleans did not, at that time, exceed 500 tons register. Surveys and reports of the passes were made in 1829, 1837, 1839, 1849, and 1851. Shortly after the survey of 1837 Northeast Pass, then the chosen commercial channel of New Orleans, shoaled up; but Southwest Pass was found to answer present purposes, being only less convenient of approach, and it continued to be used with tolerable facility until about 1850. Then the increasing draught of ships brought a new difficulty, and, "owing to pressing memorials of the citizens of New Orleans, Congress ordered an exploration of the region, and appropriated a large sum for the purpose of the deepening of the channel of the river." While various measures were being recommended, vessels of less than 1,000 tons were grounding on the bar.

In 1852 there were no less than forty ships aground on the bar from two days to eight weeks, many of them being compelled to lighter their goods, and some even to throw them overboard in order to get safely off the mud lumps. That year $75,000 was appropriated for the mouth of the river and a board of Army officers appointed to suggest a proper plan of operations for increasing the depth of water on the bar.

The system of stirring up the bottom and dredging the river was recommended by the board; and, if that failed, the building of jetties at Southwest Pass 5 miles into the Gulf, and the closing of all the lateral outlets; finally, should this fail, the digging of a ship-canal at Fort St. Philip, or some other convenient point, from the river to deep water in the Gulf. The system of dredging, by stirring up the bottom, recommended by the board, was approved by the War Department and a contract was accordingly entered into for deepening the Southwest Pass to 18 feet. The contract was

successfully executed and a depth of 18 feet obtained in 1853. No further appropriation was made until 1856, when no trace of the former deepening of the channel was left. In that year, $330,000 was appropriated for opening and keeping open, by contract, ship-channels through the bars at the mouths of Southwest Pass and Pass à Loutre. A contract was awarded to Messrs. Craig & Righter for opening both passes 20 feet deep and 300 feet wide, and for maintaining that channel four and a half years. They constructed on the east side of Southwest Pass a jetty about a mile long, which, with harrowing and dredging, deepened the channel to 18 feet, which depth was maintained during 1859 and 1860. The war then came on and the passes were neglected. In 1868 a system of dredging was again adopted by the Government, and a steam-propeller dredge was constructed at a cost of $350,000; a short time afterward a second boat was built. These two boats worked for three years, but in 1873 the Army engineers gave their opinion that this dredging could not maintain a depth of 18 feet.

The great loss occasioned by the detention of vessels at the mouth of the river at last called forth such loud demands for the deepening of the passes from the most influential organizations and men in the South and West that Congress, recognizing its responsibility, invited plans for the improvement of the mouth of the river. The two main plans suggested were:

(1) The construction of a ship-canal from Fort St. Philip to the Gulf, as recommended by the commission of Army engineers that had examined the mouth of the river in 1857, which, it was estimated, would cost $13,000,000.

(2) The building of jetties at the mouth of the river, a system of removing bars that had been tried successfully in Europe in deepening the Danube, Vistula, Oder, Dwina, and other important rivers.

THE EADS JETTIES.

The jetty scheme was strongly advocated by Capt. James B. Eads, the great engineer, who had constructed the Saint Louis bridge, and had been engaged in other important engineering enterprises.

In February, 1874, Mr. Eads made a formal proposition to Congress to open the mouth of the Mississippi River by making and maintaining a channel 28 feet deep between the Southwest Pass and the Gulf of Mexico for the sum of $10,000,000, at the entire risk of himself and associates; not a dollar was to be paid by the Government until a depth of 20 feet had been secured, when he was to receive $1,000,000, and afterward $1,000,000 for each additional 2 feet, or a total of $5,000,000 when 28 feet had been obtained. The remaining $5,000,000 was to be paid in annual installments of $500,000 each, conditional on the permanence of the channel during the ten years. This proposition at first met with vigorous opposition and denunciation.

When the matter was first submitted to Congress an appropriation of $8,000,000 was made for the Fort St. Philip Canal, which passed the House by a good majority, while at the same time the jetty plan was defeated. In the Senate, however, the canal scheme was crushed, Mr. Eads's arguments before the Select Committee on Transportation Routes to the Seaboard being so forcible that in the Senate the committee asked to be discharged from further consideration of the Fort St. Philip Canal bill, and to report as a substitute for it a bill authorizing the appointment by the President of a commission of seven engineers—three from the Army, three from civil life, and one from the United States Coast Survey—to whom this question as to the proper method of opening the mouth of the river should be referred, with instructions to report at the next session of Congress.

The report of this board was presented to Congress on January 13, 1875, by the Secretary of War, and it proved favorable to the jetty plan, the board recommending its application to South Pass. Soon after the report, Mr. Eads made a new proposition to Congress to make a channel 30 feet deep at the mouth of Southwest Pass. A bill embodying this proposition was presented to the House in February, 1875, and passed it ten days afterward. In the Senate, however, South Pass, as recommended by the board, was selected. The act became a law March 3, 1875.

The terms were that Captain Eads was to obtain a channel 20 feet deep and 200 feet wide at the bottom, in thirty months from the passage of the act, and having obtained such a channel, he was to receive $500,000 for every additional 2 feet in depth, with corresponding widths at the bottom until a depth of 30 feet and a width of 350 at the bottom were obtained. He was to receive $500,000, with additional payments, for maintaining the channel. Up to that period the payments of the Government would amount to $4,250,000, with $1,000,000 in addition, earned by Captain Eads, to be retained by the Government for a certain specified length of time as security that the jetties would maintain the channel secured. There was also a provision in the contract which gave Captain Eads $100,000 a year, for twenty years, for maintaining and keeping the jetty works in repair.

The jetties extend from South Pass across the bar into the Gulf. The total length of the east jetty as constructed was 12,100 feet, or nearly 2⅓ miles; the west jetty terminates opposite the east jetty, but its total length is only about 1½ miles, the difference being due to the greater extension of the natural banks on the west side of the pass. Without entering into a detailed account of the method of constructing the jetties, their mode of structure may be briefly stated to be with willow mattresses laid in layers and weighted with stone, and on this foundation a concrete wall is built. After successfully surmounting innumerable engineering difficulties and embarrassments of the most formidable character, Captain Eads achieved a glorious triumph in his great undertaking, and the jetties were practically completed in July, 1879. At the head of the passes a navigable channel 26 feet deep and 165 feet wide was obtained and certified to July 10, 1879. Since that date the semi-monthly surveys have shown constant increase both in depth and width. The bar at the head of South Pass, with only 14 feet of water over it, which lay like a formidable dam in the entrance of the channel, was completely removed, and the depth of water in South Pass was made greater by 2 feet than that in the two larger passes on either side of it. At the mouth of South Pass the current, which in 1875 struggled feebly against the frictional resistance of the bar that obstructed it, became, by the construction of the jetties, a strong and living force, which, attacking the obstacle in its way, swept it far out into the great depths of the Gulf, and carved out for itself a deep and wide channel more than equal to the wants of commerce. The minimum depths through the jetties at various dates since 1875 to date clearly indicate the efficacy of the scouring process caused by the jetties. In June, 1875, the water was 10.2 feet. In 1876 its greatest depth was 23.5 feet in August; its least depth was 21.0 in May. In 1877 it reached 24.2 from October 25 to December 14; its least depth was 22.0 in March. In 1878 it was 27.1 feet in December and 25.4 in March. In 1879 it was 31.7 feet in December and 27.0 in March. In 1880 the depths were, June, 31.4; July, 30.8; August, 32.0; September, 30.6; October, 30.3; November, 30.8; December, 30.8. In 1881 the greatest depth was 33.8 feet in January, and its least 30.4 feet in November. In 1882 it was deepest in September, being 31.9 feet; its least was 30.5 in February, and 30.5 in April. In 1883 the greatest depth was 33.4 in June; its least, 30.2 in January.

Since then the jetties have been put to the severest tests. In 1883 the English cable ship, the *Silvertown*, put to sea with the largest cargo ever leaving New Orleans; 10,618 bales of cotton, 319 tons of ore, 24,193 bushels of grain, 10,750 staves, 1,000 tons of coal, and 275 of water ballast; a total of 5,020 tons, the vessel drawing 25 feet 4 inches. The *City of New York* also went through, drawing 25 feet 10 inches. She was a comparatively narrow ship, whereas the *Silvertown* had an enormous breadth of beam and was nearly as broad at the bottom as at the top, being almost flat-bottomed. The saving to the people of New Orleans and the Mississippi Valley by reason of the establishment of the Eads jetties, was plainly shown by Hon. Joseph H. Burrows, of Missouri, in a speech on the improvement of the Mississippi River, in which he stated that the transportation rates on a bushel of wheat shipped from the center of the Valley, at Saint Louis by river to the seaboard at New Orleans during the three years 1877, 1878, and 1879, ranged all the way from 10 to 15 cents less than by rail to the seaboard at New York. That, owing to the jetties, half of the total grain produced in the 14 Valley States could be shipped from Saint Louis to New Orleans, instead of by rail to New York, with an annual saving to the seaboard at 10 cents per bushel, which would be $90,381,552, and at 15 cents per bushel, $135,572,328.

The following table is taken from the annual report of Major Heuer, engineer in charge of the jetties, and gives the lowest depth and width of the 26-foot and 30-foot channels through the jetties, according to surveys made in May and June, 1887, respectively:

Distances from east point in feet.	Month.	Least width for—		Least depth.
		30 feet.	26 feet.	
0 to 2,000	May	180	330	39.4
	June	90	350	39.0
2,000 to 4,000	May	320	370	35.3
	June	280	330	35.4
4,000 to 6,000	May	320	390	37.1
	June	330	380	37.5
6,000 to 8,000	May	210	290	31.2
	June	210	280	32.3
8,000 to 10,000	May	210	290	31.2
	June	130	250	34.1
10,000 to 12,000	May	230	300	38.1
	June	190	270	35.2

Beyond the ends of the jetties there is a central depth of 30 feet on a direct course from the ends of the jetties to the sea; the 26-foot channel is 210 feet wide and the 30-foot channel 60 feet wide.

At the head of South Pass, that is from the main river into South Pass, there is a central depth of 29 feet, and the 26-foot channel is very wide.

Above Goat Island the central depth is 29 feet, and the 26-foot channel is 380 feet wide.

Near Grand Bayou the central depth is 28 feet, and the 26-foot channel is 200 feet wide.

The following are the expenditures at various times of the Government on the improvement and deepening of the passes, other than the contract with Captain Eads for the jetties:

Year.	For what expended.	Amount.
1829	Survey	$500
1836	Increasing depth	75,000
1837	Removal of obstructions	120,000
1850	Survey	50,000
1852	do	50,000
1852	Opening ship canal	75,000
1856	Improvement of South Pass and Pass à l'Outre	330,000
1866	Improving mouth of river	75,000
1867	do	200,000
1868	do	50,000
1869	do	85,181
1870	do	300,000
1871	do	125,000
1872	do	155,000
1873	do	125,000
1874	Improving mouth of river and survey	85,000
1875	Improving mouth of river	250,000
1876	Improving mouth of river and survey	115,000
1877	do	12,000
1878	Survey	15,000
1879	do	24,000
1880	do	10,000
1881	do	10,000
Total		2,526,681
	Expended by the Government for the construction of the jetties under the contract with Capt. James B. Eads.	5,950,000
Total		8,476,681

MISSISSIPPI RIVER IMPROVEMENTS.

In respect to the improvement of the Mississippi River for purposes of navigation, little or anything was done save at the mouth before 1878. This was due to two reasons—because the Government did not fully recognize its obligations in the matter, and because the removal of snags and obstructions was deemed sufficient improvement. The first work undertaken on the Mississippi was on the upper course of that stream at the Des Moines.

In 1868 Congress made an appropriation of $40,000 for the removal of obstructions in the Mississippi River. It had previously set aside $3,352,040 for the snag-boats employed in service on the western waters. This service was not confined to the Mississippi alone, however, but included work on its leading tributaries—the Ohio, Missouri, Red, and Arkansas. About 40 per cent., or $1,340,800, may be counted on as having been expended on the Mississippi below Memphis, which, with the special appropriation of $40,000 in 1868, makes the total for the removal of snags in that river $1,380,800 up to 1879. Since 1879 the expenditures on the snag-boats on the Mississippi and Missouri have been $495,349.77. Allowing 50 per cent. for the Mississippi, it gives $247,674.88 as the snag expenditures since 1879.

In 1878 the river and harbor bill included a number of items for river improvements, mainly at the harbors of the chief towns.

Memphis harbor received	$8,300
Vicksburg	134,000
New Orleans	110,000
The mouth of Red River	190,000

In 1880 the appropriations were:

Memphis harbor	$15,000
Vicksburg	20,000
Natchez and Vidalia	40,000
New Orleans	75,000

In 1881, the following:

Memphis	15,000
Vicksburg	75,000
Natchez	50,000
New Orleans	75,000
The Passes	10,000

The following are the amounts expended on the improvement of the Mississippi previous to the creation of the River Commission:

Years.	For what expended.	Amount.
1871	Gauging	$5,000
1874	Improvement of the alluvial basin	25,000
1876–'78–'79	Guaging	15,000
1878–'79	Protection of harbor of Memphis	83,000
1878–'79	Protection of harbor of Vicksburg	134,000
1878–'79	Protection of harbor of New Orleans	110,000
1880	Harbor of Memphis	15,000
1880	Harbor of Vicksburg	20,000
1880	Harbor of Natchez and Vidalia	40,000
1880	Harbor of New Orleans	75,000
1881	Harbor of Memphis	15,000
1881	Harbor of Vicksburg	75,000
1881	Harbor of Natchez	50,000
1881	Harbor of New Orleans	75,000
	Total expended on river improvements previous to river commission, except on passes and removal of snags	737,000

MISSISSIPPI RIVER COMMISSION.

In the meanwhile in 1879 Congress had passed the bill creating the Mississippi River Commission, of seven members, to suggest a plan for the general improvement of the river and to control and supervise the work done. Under that body the work has since been systematically carried on with much larger appropriations than formerly. The following are the amounts voted by Congress at different times to the improvement of the river under the Commission:

1881	$1,000,000
1882	4,123,000
1883	1,000,000
1884	2,065,000
1886	1,994,057
Total	10,477,855

Of this there has been expended for channel work, as distinguished from levees, the following amounts:

Location.	Amount.	Location.	Amount.
Memphis harbor	$615,077	Natchez and Vidalia harbors	$8,253
Helena reach	8,000	Red and Atchafalaya Rivers	316,717
Choctaw reach	2,680	New Orleans harbor	233,195
Repairs to plant	30,000	Cubit's Gap	137
Greenville harbor	37,500	General service	114,259
Vicksburg harbor	197,819		
Lake Providence reach	2,415,902	Total	3,979,539

The following is the levee work done in the same district by States:

Tennessee: Lauderdale.

Mississippi: Tunica and Coahoma; Bolivar Riverton; Bolivar Hughes; Washington and Issequena; Ben Lomond.

Arkansas: Mississippi, Long Lake, Phillips, 'Possum Fork.

Louisiana: East Carroll, Madison, Tensas, and Concordia; general protection of Tensas Basin; Pointe Coupée Morganza; general protection Atchafalaya Basin; Bonnet Carré.

The apportionment among the several States was as follows:

Tennessee	$100,000
Mississippi	624,678
Arkansas	404,561
Louisiana	1,342,810
Total	2,472,049
Total amount expended by river commission between Memphis and Gulf	6,451,588

LOUISIANA AND RIVER IMPROVEMENTS.

Among the river States, Louisiana has led by a long distance in the matter of river improvement. This was due largely to the fact that it was first settled, and was most dependent upon keeping open its water courses. The settlements in Louisiana were almost altogether upon the streams. To secure, therefore, communication with markets, it was necessary to keep the interior rivers and bayous free from snags and other obstructions.

Louisiana, in consequence, expended more upon its levees and river improvements than all the other lower Mississippi States. There were some improvements attempted under the French and Spanish governments, especially at the passes, as already narrated. In 1814 the dike across Bayou Manchac was constructed to cut off that outlet.

In the early days of the State a large amount of work was done, but mainly by private individuals, the steam-boat men and keel-boat men. The Mississippi and all its tributaries were at that time filled with logs and snags, and navigation rendered dangerous thereby. These obstructions the steam-boat men gradually removed themselves, opening most of the streams. There are, of course, no figures attainable of the cost of this work. If, however, the work done in the way of removing the rafts, logs, and snags be estimated on the basis of that subsequently undertaken by the State boards of works and State engineers the expense of river improvement between 1800 and 1815 was from $12,000 to $15,000 a year; and from 1815 (when the steam-boats began running) until 1833 from $25,000 to $30,000, or $490,000 for the whole period. This, however, is merely an estimate of its cost based on the work subsequently done by the State.

After 1833 the statistics are reliable and authentic as the board of public works and the various other boards carrying on the interior improvements upon which the State had entered, were required each year to present full itemized reports to the legislature. These reports give the various works under way and their cost. The great aim of the State government at that time was to give all portions of Louisiana a route to market which was done partly by the improvement of the interior water ways and partly by means of public roads.

In 1833 the legislature of Louisiana organized the board of public works, for the improvement of the State and particularly for cleaning out the streams, removal of snags and logs and other obstructions. The first work undertaken was the removal of the rafts obstructing the Atchafalaya and Grand Rivers, and Bayou Sorrel, in order to open the navigation through these streams to the Attakapas.

It became, at the same time, necessary to improve the mouth of Red River and the connection between that stream and the Mississippi, which had been injuriously affected by the cut off made near its mouth by Captain Shreve, on behalf of the United States, in 1831.

The board worked zealously at these two enterprises, making, however, little progress with them, and fifteen years afterwards, complaint was still made about the raft in the Atchafalaya and its obstruction to navigation. The opening of that stream moreover had an unfavorable effect on the mouth of Red River. When the raft was partly broken and removed the increased current velocity of the Atchafalaya soon washed out the light deposits in the channel, and it was thus able to carry off a large volume of the Red River and divert that stream from the Mississippi.

The board of public works had complete charge of all the public improvements going on in the State, the income being derived from the public-improvement fund, obtained from the sale of lands granted Louisiana for its internal improvement. The work done

was confined mainly to river improvement, the removal of rafts, dredging of the streams to give them greater depth, and construction of canals to give intercourse between navigable rivers. The board had three boats in the field, with crews of sixty men, and occasionally chartered other vessels. The operations for the year 1840 show work done on the Atchafalaya and Bayou Plaquemines, on Bayous Bonfouca, Packet, Manchac Pass, which was opened; Bayou Plaquemines opened to the Mississippi, where works were constructed to prevent the logs from drifting in and causing the Atchafalaya raft; on Bayou Bœuf, opened to Prairie Jefferson; Tensas, to Bayou Roundaway; Maçon, throughout, Bayous Bartholomew, Des Glaizes, and Courtableau. The United States had undertaken the removal of the obstruction in the navigation of the Red River, near Alexandria, known as the "Rapids," or Falls. Louisiana also made an appropriation for this purpose, and an arrangement was made with the United States contractor to carry on the improvements under the State specifications for slightly less than the legislature had appropriated for this purpose.

The work was done mainly with slaves owned by the board of works. A few convicts were employed, but were not found satisfactory. The expense for labor, therefore, was small. The total expenditures for the year were $54.895.54. Of this, $5,000 was expended in Bayou Courtableau under a special appropriation of the legislature. All but $1,017 was expended on the Mississippi or tributary streams. The cost of the works at the junction of Bayou Plaquemines and the Mississippi to prevent the deflection of logs was $2,080. This floating boom proved to be of only temporary benefit, and the State found it necessary each year to remove the logs gathered at the mouth of the bayou and to make changes and additions to the boom.

In 1846 the State had at work three boats and 114 men. It purchased that year a snag-boat and a dredging machine. The total expenditure, aside from work on the levees, that is, the amount spent for the direct improvement of streams, the dredging of channels and removal of snags, was $62,668. It ranged from $50,000 to $85,000 a year for the next ten years.

The State board of works continued actively on river improvement until the war broke out, with from three to six boats and from 50 to 150 men, most of them slaves, the principal work being done in Bayous Tensas, Grosse Tete, Courtableau, Maçon, and the Mississippi, Red, Grand, and Atchafalaya Rivers. In 1847, under a special act of the legislature, a contract was made by the State with a Mr. Hoard to cut a canal across the Raccourci Bend, and thus cause a cut-off in the Mississippi River at that point. At that time great confidence was felt in cut-offs, and it was proposed in this way to straighten the river and reduce its length, and thus do away with levees. And as Captain Shreve had made his cut-off near the mouth of Red River for the United States, so Mr. Hoard developed Raccourci Cut-off in the immediate neighborhood for the State of Louisiana. The work was done in defiance of the advice of the State engineer and cost $12,000. It consisted simply of a canal cut across the head of the Raccourci isthmus, through which the river poured, and in a very short time found its way, leaving its old bed a lake. It is now admitted that Louisiana made a grave mistake here. Instead of lowering the level of the river, as expected, it raised it, and the parish of Pointe Coupée below has suffered severely in consequence of these cut-offs, and has been compelled to raise its levees several feet until they are now the highest in Louisiana. Another effect of this work was to close up Old River, the connection between the Red and the Mississippi. This followed immediately after the making of Raccourci Cut-off, and in consequence of it and the removal of the raft in the Atchafalaya.

The unsettled condition of a large portion of Louisiana and the immense number of logs and snags floating down the Mississippi from the new settlements being made above rendered it absolutely necessary to keep up this work of improvement. Thus, we find that the raft in the Atchafalaya and Grand Rivers and at the junction of Bayou Plaquemines and the Mississippi re-formed each year and had to be removed. Although the work of improvement was under the control of the State board of works and the State engineer, it was really directed by the legislature, which provided that such and such streams should be improved or cleaned, in much the same manner as Congress directs the United States engineers to-day. The legislature passed, for instance, in the six years between 1847 and 1853, no less than 132 different acts in regard to river improvement and affecting the State engineer and board of works, and providing for the cleaning out and improvement of streams aggregating over 5,000 miles in length.

In 1852 commissioners were appointed and money appropriated by the legislature for the removal of the falls in Red River. The work was let out, but nothing was accomplished, nor did a second appropriation bring any permanent good, and the reports declared a lock absolutely necessary there. [The falls have since been removed by the United States.]

The donation made by the United States to the State of Louisiana in 1849 of all the swamp lands within its limits, to be used for the redemption of these lands, led to a great

activity in levee building and in the improvement of the streams. The State was divided into four districts, in each of which was a commission in charge of the management of the swamp lands and of the various improvements going on there. The work undertaken was of a colossal character, and included the building of levees, the digging of canals, drainage of the swamp lands, and improvement of the streams. Most of the works undertaken were ordered by the legislature. Some idea of the magnitude of these operations may be arrived at by the fact that in a single district, the second, in one year, appropriations aggregating $352,500 were made out of this swamp fund. It is true that the works cost less than the appropriations and that there was a handsome balance left to the credit of the fund, but the activity shown in public improvements may be imagined from this total. The bulk of the work done, however, was the building of levees and the digging of canals, not so much for the improvement of navigation as for the redemption of the swamp land by properly draining it. The work of river improvement by the State continued actively through all this period.

In 1854, notwithstanding what had been already done in the improvement of the Atchafalaya, the legislature found it necessary to let the work of cleaning out that stream by contract, the price paid being $15,000.

In 1855 Louisiana undertook the improvement of the Ouachita, expending for that purpose $8,935, without securing any benefit therefrom beyond a survey of the river. The special report on this subject calls attention to the increased danger of obstruction at the mouth of Red River, which entitled it, the report declared, to the constant service of a dredge-boat at each high water, "since it is justly apprehended that at any season when the Red River shall have no rise subsequent to a rise in the Mississippi, the channel into it will most probably be barred up."

A timely warning this, for no other point on the Mississippi has given more trouble to the United States and Louisiana engineers than this.

In 1856 the State force at work included three snag-boats, two dredge-boats, and 95 slaves. The State engineers were also allowed to use, for the space of a year, all the runaway slaves in the Baton Rouge depot. The work to which this force was principally devoted was the cleaning out and improvement of the Atchafalaya, the removal of the falls in Red River opposite Alexandria, and keeping open the mouth of Red River where it joins the Mississippi. Innumerable plans were suggested for these several improvements, dams, locks, etc.

In 1859 the State appropriated $35,000 for Old River and the mouth of Red River, which had by this time become a chronic nuisance. Frequent appropriations had been made for this work—indeed, scarcely a year passed without it having been attended to and dredged; but the river was kept open in this way only a short time, and each report closes with the statement that the improvement secured was only temporary. On this point and the Atchafalaya, the bulk of the State river improvement fund was expended. In 1860 the State finally came to the conclusion that the only way by which the connection could be maintained between the Red and the Mississippi was by constructing a dam or sill over the mouth of the Atchafalaya where it joins Old River—the plan proposed by the Mississippi River Commission to-day. This work was ordered by an act of the legislature in 1860, but interrupted by the war. The cost was estimated at $996,000. Another plan proposed at the time was the closing of Bayou Plaquemines (since done) and its connection with the Mississippi by way of locks (reported on favorably by the United States engineers), the cost of which was estimated at $226,000.

In 1860 the appropriations required for the execution of the several works, based upon the surveys called for under special acts of the legislature or under general order from the board of public works, amounted to $1,288,765. Acts were passed by the legislature approving nearly all these schemes of improvement, and there is little reason to doubt that they would have been undertaken had not the war called a halt. None of them, however, were even begun; and during the few months intervening before the declaration of hostilities, the board of work confined its attention wholly to levees.

It is difficult to arrive at the amount expended by the State of Louisiana during this period for river improvement. The appropriations of the legislature are far above the actual amount expended, running up some years to $500,000 and $600,000. The expenditures of the State board of works, State engineers, and the commissioners of the four swamp-land districts were for the improvement of navigation, of drainage, for the opening of rivers, removal of snags, construction of levees and canals, and even of roads, and these are always very much mixed up with each other. It is possible, however, to disentangle them, but only by going over the expenditures item by item. The work was done mainly by negro slaves, the cost of whom was an important item, the slaves used for the dredging and snagging boats having cost the board of works no less than $275,500. In each report there is a demand for more slaves, and a request made that the State vote $250,000 for the purchase of extra negroes for this work. The engineer estimated in his report that the work could be done by slave labor at half the cost of free whites. In the

following tables below, therefore, the estimates of the actual value of the improvements ought to be doubled—that is, the work done is twice as much as the money value represents. In this cost is included the negro slaves purchased, as well as the dredge and snag boats, lumber, and other expenses. These and the salaries of the State engineers and the actual cost of subsistence of the slaves employed on government work were the sole expenses, for there were no wages paid to hands. For a short period, the negro prisoners in the penitentiary were used in the State improvement works, but they were not found satisfactory. Later, the runaway slaves impounded at Baton Rouge were required to labor twelve months on the government works before they were sold.

The following shows the amount expended by the State of Louisiana, or its districts or divisions, for the improvement of the navigation of the Mississippi and its immediate tributaries, aside from the amounts expended for levees, dikes, etc., and represents the expenditures for dredging the stream, removing rafts, logs, sawyers, and snags, for booms, dams, and other constructions to regulate the outpour of the river, for cleaning outlets, and in general for all works intended directly and immediately for the improvement of the navigation of the Mississippi and its tributaries, not including any amount expended for levees, for the protection of land from overflow, or for any other drainage purposes:

Expenditures for river improvement.

1833 to 1840	$445,724
1840 to 1845	302,120
1845 to 1850	317,472
1850 to 1855	212,264
1855 to 1861	377,120
Total	1,654,700

The amount expended during this period for river improvements by the parishes and private individuals was small, as the State boats went from stream to stream, clearing away all obstructions. Only an estimate can be made of these expenses, as about $60,000, or a little more than $2,000 a year. There has, indeed, been scarcely a year when the steam-boats have not done something towards river improvement, and they estimate their expenditures or time for this purpose, even to-day, when the Federal Government has taken charge of the rivers, at $5,000 annually.

The war that followed interrupted all State work except a little leveeing here and there. Nothing was done towards the improvement of the Mississippi and its tributaries; indeed, the aim was rather to close the streams and render them inaccessible to the Federal gun-boats than to keep them open.

In 1865, immediately after peace came, an important work was undertaken by the parish of Iberville and the planters of the immediate neighborhood in the closing of Bayou Plaquemines. This had always been a troublesome point on the Mississippi, and as early as 1840 the State engineers had taken it in charge; for here the logs drifted from the Mississippi, interfering with its navigation and filling up the Atchafalaya with a raft. The river showed, moreover, a disposition to cut in here, and it was deemed necessary, both in the interest of its navigation and the protection of the interior country, to close this navigable stream. An attempt was made by the State engineers some eight years later to reopen it, but they were forcibly driven from the field by the people of Iberville. A survey has since been made by the United States engineers looking to the reopening of the bayou with a lock.

With peace, the State did not return to the river-improvement works it had on hand when the war broke out. Both the levee board and the board of public works (recreated in 1868) confined themselves almost wholly to levees. The United States had fully undertaken the work of removing the snags and obstructions which had previously constituted so large an element of the work done by the State in improving the navigation of the Mississippi and its tributaries. The only river improvements in which Louisiana interested itself were at the head of the Atchafalaya, at Old River, giving the Red entrance to the Mississippi and the Red River Falls. For Old River an appropriation of $64,000 was made in 1869, but the contract became involved in litigation and another contract was subsequently made. In 1869 the improvement of the navigation of the Teche was begun with a series of dams and locks, but after the expenditure of a large sum it was abandoned *in toto*. An attempt was also made to cause a new cut-off in the Mississippi at Waterproof, but without success.

The recognition by the Federal Government about this time of the importance and duty of interior river improvement and the appropriations for the chief rivers of Louisiana, in the river and harbor bill, did away with the State work. The only State river improvement or expenditures since have been the construction of a dam across Tone's

Bayou in Red River, which work was afterwards taken up by the Federal Government, and the improvement of Old River, connecting the Mississippi, Red, and Atchafalaya. The last work undertaken by Louisiana was in 1877. Dissatisfied with what the Federal Government had done at the mouth of Red River, and in deference to the requests of the steam-boat people who found themselves cut off from the Red, Ouachita, and other streams, the legislature voted $20,000 for the improvement of navigation at Old River. The work was undertaken by the State engineers, assistance being given by the steamboats engaged in the Red River trade; and, at the expense of $7,220, the river was opened to navigation.

Since then, the State has done nothing save in the work of leveeing and draining. A considerable amount, however, has been expended by private citizens, principally by the steam-boat men, to improve the navigation of the Red at Old River and the Falls, and at Little Devil's Bar, on the Courtableau, a tributary of the Atchafalaya. This cost, however, has been mainly in labor in the use of boats and men rather than in materials, and it is somewhat difficult to estimate it exactly. It can only be done on the basis of the time consumed and men employed on the work. The expenditures from 1865 to 1887 for river improvement, other than levees, has been $168,220 for the State and $115,500 for the parishes, planters, citizens, and steam-boat men, or a total of $283,720. During the greater portion of this period, the work of river improvement, snagging the river was carried on by the United States engineers, and the State thus relieved from all except levee work.

The following table gives the amounts expended by the State or Territory of Louisiana in the improvement of its streams during the present century. It is restricted entirely to the improvements made for purposes of navigation, and includes none of the numerous works undertaken for drainage purposes, or for the protection of land from overflow or the redemption of swamp lands; and it is further restricted to the Mississippi and its immediate tributaries, which more or less affect it—the connection between the Red and "the Father of Waters," and the Atchafalaya, which plays so important a part in the improvement of the Mississippi:

Estimated work done mainly by private individuals, steam-boats, flat and keel boats, with some assistance from the planters, 1803 to 1833	$490,000
Work done mainly by State and districts under boards of public works, engineers, etc., 1833 to 1861	1,714,700
Work done by State, parishes, and private individuals, mainly steam-boat men, 1861 to 1887	287,220
Total	2,491,920

As nearly as it can be divided these expenditures were:

By State	$1,826,235
By parishes, towns, and districts	205,285
By private individuals, companies, steam-boats and others	460,400
Total	2,491,920

The five chief items in this total were:

Dredging the mouth of the Mississippi.

Dredging and improving the connection of the Red and Mississippi, and the Atchafalaya.

Removing the Plaquemines and Atchafalaya raft, a work on which the State was engaged for nearly twenty years.

Removing snags and obstructions.

It is safe to say that three-fourths of this sum went for these specific purposes.

There are no records whatever of the expenditures for river improvement previous to the American dominion, although several references are made in the history of Louisiana to work done, particularly at the mouth of the river. Judging by the experience in later years, it would be safe to put the expense of the work at the passes under the Spanish and French Governments at $200,000. Of the other improvements, such as clearing away snags, there are no records whatever.

The other two lower river States have done little in the way of river improvement as compared with Louisiana. They were both settled many years afterwards, at a time when the Government recognized its obligation in the matter of the removal of snags. The State of Mississippi co-operated to a certain extent with Louisiana in the improvement of certain streams in which they were jointly interested, notably the Mississippi and the Pearl. Some work was done in the matter of snagging, but this was mainly by private individuals, by the planters and steam-boat men. Latterly, the town of Greenville has expended large sums for the purpose of holding the river bank there, a matter of equal

importance to the town and to the maintenance of the river and the improvement of its channel. The Mississippi has been eating away the banks at Greenville for some time, destroying the front of the town. For over ten years the constant caving has destroyed the permanent value of real estate, 1,200 feet of valuable property having been swallowed up by the river. The Mississippi River Commission appropriated $37,500 to hold the bank at Greenville, regarding that as essential to the plan of river improvement it is carrying on. The appropriation was supplemented by the people of Greenville, who contributed $50,000 towards the work in the way of bonds. A survey was made and work begun in September, 1887.

The plan adopted is known as the "submerged dike" system. It was used with absolute success last year at Memphis, where a most serious caving, which menaced many large manufacturers and the Government building, was put an end to.

The base of each of these dikes consists of a stout mat woven over and under with willow trees, which are supplied by contractors from the Arkansas side. The weaving process is carried on on a floating structure known as a "mattress way," an inclined plane toward the water. As each section of the mat is completed and securely bound with iron rods and stout galvanized wire, it slides into the river and the work proceeds. These Greenville mats will vary in size. Some of them when completed will present the appearance of hugh woven rafts, 400 feet by 200 feet. They are afterwards sunk by loads of stones to form the substructure of the dikes. Cribs, also loaded with stones, will be placed on these mats, thus forming a complete dike. These dikes will project from the river-bank at intervals sufficiently close to prevent any scouring out, and rather encourage filling in.

There has been practically nothing done in the State of Arkansas in the way of river improvement beyond the construction of levees and the removal of snags and obstructions in the streams. The legislature by special acts specified and fixed the navigable streams.

EXPENDITURES OF LOWER RIVER STATES FOR RIVER AND LEVEE IMPROVEMENTS.

The following table gives the expenditure of the lower river States for river improvements, including levees and other works having the effect of improving the navigation of the Mississippi, whether so intended or not:

Louisiana:	
Levees built previous to 1862	$25,600,000.00
Levees built since 1862:	
By State and levee districts	13,745,148.57
By parishes, planters, railroads, etc	800,280.17
River improvements previous to 1803 (estimated)	400,000.00
River improvement since 1803:	
By State	1,826,235.00
By parishes	205,285.00
By private individuals, companies, etc	460,400.00
Total amount spent in river improvement, including levees	43,037,348.74
Mississippi:	
Levees built previous to 1862	14,750,000.00
Levees built since 1862:	
By levee districts	5,847,004.70
By counties, planters, railroads, etc	800,000.00
River improvement (partly estimated)	665,500.00
Total amount spent on river improvement, including levees	22,062,504.70
Arkansas:	
Levees built previous to 1862:	1,300,000.00
Levees built since 1862:	
By State, districts, counties, and municipalities	1,575,000.00
Arkansas—continued.	
By planters, railroads, and others	$375,000.00
River improvement and cleaning (partly estimated)	275,000.00
Total river improvement, including levees	3,525,000.00
Amount expended on river improvement below Memphis, in Arkansas, Mississippi, and Louisiana, including levees:	
Louisiana	43,037,348.74
Mississippi	22,062,504.70
Arkansas	3,525,000.00
Total	68,624,853.44
Amount expended by the Federal Government:	
Removal of snags and obstructions	1,628,474.88
Passes	8,476,681.00
Levees	2,562,049.00
Channel work	4,716,539.00
Total expended by Federal Government	17,383,743.88
Amount expended by the States, parishes, municipalities, etc	68,624,853.44
Grand total of expenditures on the improvement of river	86,008,597.32

THE MORE IMPORTANT RIVER TOWNS.

POINTE A LA HACHE—GRETNA—DONALDSONVILLE—BAYOU GOULA—PLAQUEMINE—BATON ROUGE—BAYOU SARA—FORT ADAMS—NATCHEZ—VIDALIA—RODNEY—VICKSBURG—MAYERSVILLE—GREENVILLE—ARKANSAS CITY—HELENA—MEMPHIS.

Give some account of the more important towns on the river.

Between Memphis and the Gulf both banks of the Mississippi are, with few exceptions here and there, densely populated. The first settlements in the lower valley were made on the river, because it afforded the best means of transportation and communication, and moreover because the soil was of the most productive character. The cultivable land stretched back from one mile to twenty from the river bank, in some places having no limit whatever. Throughout this entire stretch of the river the west bank is low alluvial land, save at Helena, where Crowley Ridge reaches the Mississippi. On the east side there are bluffs, greater or less, at Baton Rouge, Natchez, Vicksburg, Memphis, and other points.

In Louisiana, the settlements have extended up the river from New Orleans, never venturing for years after the first colonization far away from the Mississippi. In Mississippi the nucleus of the future State was laid at Natchez, and nearly its entire population was for years collected immediately around that town. In Arkansas it was the same story; the first colonists established themselves on the river, and in after years pushed inland. The river section, therefore, is the oldest portion of these States, is the most densely populated and boasted formerly, and boasts to-day, of the largest and most important towns.

In Louisiana the population on the river reaches the maximum in the State—50 to 100 to the square mile in purely agricultural districts. It is not so dense in the Yazoo-Mississippi country, and was until lately behind the average of the State there; but there has been an immense immigration in the last few years, and the population has increased with startling rapidity. The lack of levees in Arkansas has resulted in a sparser population on the river bank than in the other two States. In all these the negroes are in a large majority on the river bottoms and bluffs, in some places being ten and twelve to one white.

Between Memphis and the Gulf, stretched along the Mississippi, are a number of towns. Of these of over 2,000 population in Louisiana, 5 out of 9 are situated on the Mississippi. In Mississippi, its two largest towns, Vicksburg and Natchez, are both upon banks of the river.

While these towns are not relatively of as great importance as formerly, they still do a large business, both commercially and industrially.

The most important on this stretch of the river are Gretna, Donaldsonville, Plaquemine, Baton Rouge, and Bayou Sara, in Louisiana; Natchez, Vicksburg, and Greenville, in Mississippi, and Arkansas City and Helena, in Arkansas, besides many other smaller places. These towns do not handle as large a share of the river business as would be generally imagined. Nowhere in the world is so large a proportion of shipments made direct from the farm and plantation to market. It is this that gives the river farms such great advantages. A plantation within a couple of miles of Baton Rouge or Natches will ship or receive nothing from these cities, but send its cotton or sugar direct from its landing to New Orleans, and get its supplies from that city or Saint Louis also direct at the landing. The great bulk of the business of the Lower Mississippi is handled in this way, and comes to market direct from the farm instead of passing through any town. The "way" landings—that is, those where the boats do not land regularly, but will do so if hailed—are practically without number. Wherever a boat can land—and there are few places where this is impossible—it will do so, and take on or discharge freight. As a consequence of this condition of affairs, some of these river towns enjoy less trade than might be expected from their population.

Circulars were sent out to prominent citizens of these towns, containing queries on important commercial and industrial matters, statistics, etc. Some have not been filled up as thoroughly as might have been desired; but this is due not to any unwillingness to reply, but to the fact that in the smaller villages no statistics whatever are kept of the arrivals and departures of steam-boats or the produce received and shipped. Even in the larger cities the statistical information on these points is not always full. The following were the queries submitted:

1. What is the population of your city?
2. Of your county?
3. How many manufacturing establishments have you in your city?
4. How many in your county?
5. In what year was each established?
6. What was the amount of the product of each manufactory for the year 1886?

7. What was the value of the annual product of each for the year 1886, and the amount of capital invested?

8. What proportion of the capital invested is owned by residents of your State, county, or town?

9. Where is the bulk of the manufactures of each kind distributed for sale and consumption?

10. How much of each kind of manufacture is consumed in the State, and how much goes out of the State?

11. To what localities and by what routes transported, and approximately the percentage by each route?

12. How many operatives are employed in each manufactory?

13. What is the total amount of the annual wages paid them?

14. From what sources are the raw materials for each kind of manufacture procured?

15. What effect does the opening and close of river navigation have on your commerce and manufactures?

16. How many tons of freight, with character and approximate value thereof, were received by river from the South in 1886?

17. How many tons of freight, with character and approximate value thereof, were received by river from the North in 1886?

18. How many tons of freight, with character and approximate value thereof, were shipped South by river from your city in 1886?

19. How many tons of freight, with character and approximate value thereof, were shipped North by river from your city in 1886?

20. Please give the tonnage, character, and, if possible, the approximate value of the freight received by rail from the several points?

21. Please give the tonnage, character, and, if possible, the approximate value of freight shipped by rail from your city, showing destination of the principal portion so shipped.

22. Please state the difference between rail and water rates from your city to other points upon the river.

23. Give summer and winter rates to and from leading points upon the river.

24. Give a brief historical sketch of your city.

25. Give a brief statement of the business and development of your city in 1886, showing the amount, in tabular form, of the manufacturing, mining, building, jobbing, wholesale and retail sales, and other business.

26. From what sources do you receive your mercantile supplies other than such as are manufactured in your city, and by what routes are they received?

27. How far does your distributive trade extend, and by what routes distributed, and what other cities or towns compete with yours for this distributive trade?

28. Number of steam-boat arrivals at your town each year from 1840 to 1886, inclusive, so far as practicable, and total tonnage each year.

POINTE À LA HACHE.

The only town of any importance below New Orleans is Pointe à la Hache, seat of justice of Plaquemines Parish. Pointe à la Hache (Hatchet Point) contains a population of 600 to 800, and the parish Plaquemines of 12,0 0. It is situated 46 miles below New Orleans, on the left bank of the river, and is connected with the Crescent City only by the Mississippi, boats running daily between the two places. It lies in the center of the rice district of Plaquemines, a country inhabited by small farmers, generally white, and largely of French creole origin. It boasts of one industry, a rice mill, which cleans and hulls some 35,000 barrels of rice annually, all of which is shipped to New Orleans. The trade of the town is wholly with New Orleans and by river. Everything is received from the "Crescent City," provisions, clothing, even the lumber and bricks used in building. The stores of Pointe à la Hache do a good business retailing goods to the rice farmers of the neighborhood. There were 526 arrivals of steam-boats in 1886, besides some luggers. The time to New Orleans is but a few hours.

Pointe à la Hache is one of the earliest settlements made by the French in Louisiana. It has gradually grown up from the surrounding country, instead of springing into life as a town. Its history has been uneventful, save two or three invasions of the sea water from the Gulf, which have swept upon it from the rear. Such a flood in 1886 did some damage and materially cut short the rice crop of the neighboring farms. The trade of the town is wholly limited to a retail business with the farmers and hands of the vicinity, save in the matter of rice, which is purchased by the mill, cleaned, and shipped to New Orleans.

GRETNA.

The town of Gretna is merely a suburb of the city of New Orleans, although lying in a different parish, of which it is the seat of justice. It is situated upon the Mississippi

River, immediately opposite the upper portion of New Orleans, which is reached by two ferries. The industries of the place, consisting mainly of cotton-seed oil mills (2), cotton ginnery, moss factories (3), are included in the census among those of New Orleans, the capital being owned there, some of the operatives living there, and all the products being transferred there for sale or shipment. Gretna receives nothing save the cotton seed, and seed cotton brought there in barges, and the moss by boat or cars, all of which are included among the receipts of New Orleans. While, therefore, a town of some 3,000 people, with important industries, although practically a distinct town and the seat of justice of Jefferson Parish, it can scarcely be considered separate from New Orleans. Two railroads run through it, the Texas and Pacific and Southern Pacific, and it is in constant communication with New Orleans by a steam ferry.

DONALDSONVILLE.

1. The town of Donaldsonville contains a population of 3,500.
2. The parish of Ascension contains 18,000 people.
3. There are three saw-mills in Donaldsonville.
4. Iberville Parish is devoted mainly to the production of sugar. In addition to the factories in the town there are a number of saw-mills, cotton-gins, and 49 sugar-houses and refineries in the parish, many of them containing the largest and finest machinery in the State.

8. About 75 per cent. of the capital invested in manufactues is owned in Donaldsonville and Ascension Parish; about 90 per cent. in the State of Louisiana, there being a number of sugar planters who reside in New Orleans.

9. The products of the said mills are used mainly for home consumption. The sugar and molasses is shipped to New Orleans and thence distributed to all portions of the country, being shipped by rail, river, and ocean route, New York, Saint Louis, and Cincinnati being the main points of destination. Less than one-tenth the product is consumed in the State.

15. Donaldsonville lies at the junction of Bayou Lafourche and the Mississippi River. Both sides of Bayou Lafourche are lined with sugar plantations in a high state of cultivation for some 50 miles down towards the Gulf; beyond these are rice farms and plantations extending nearly to the Gulf. The Mississippi is navigable to Donaldsonville at all times and seasons. The Lafourche is closed to navigation six months of the year, which is very detrimental to all interests as it makes the people living on that stream dependant on the railroad.

22. The rates by rail and river to and from Donaldsonville are about equal, the water rates being determined by competition, that is, the steam-boats fix their rates to agree with those by the Texas and Pacific Railroad, making allowance for any difference in insurance.

24. The town of Donaldsonville is one of the oldest in the State, having been founded about a century ago. It was the capital of Louisiana in 1834, when the capital was removed to New Orleans and afterwards to Baton Rouge. It was partially destroyed by fire during the war and seriously set back by this catastrophe. The population of the town is mainly of creole origin, that is, of French and Spanish descent. It has been very conservative, but lately signs indicate growth and progress.

25. The mercantile business is chiefly retail. The large plantations in the vicinity of Donaldsonville get their supplies mainly from New Orleans, but the smaller farmers, particularly in the Brulés, or openings in the woods and swamps in Ascension and Assumption Parishes, make their purchases in Donaldsonville. The average annual sales are $1,000,000. There is no other business of consequence in the town.

26. Supplies are obtained chiefly by river from the West and from New Orleans.

27. The distributive trade of the town extends about 15 miles above and below along the river and in the interior. There is no competition of any consequence.

BAYOU GOULA.

1. The population of the town of Bayou Goula is about 600.
2. The population of Iberville Parish is 18,000.
3. There is but one factory in town, a lumber mill, established in 1879, but in its vicinity are a number of large sugar factories.
4. The lumber mill employs only a few hands, paid from 50 cents to $1.50 a day, and turns out 4,000 bee-hives, frames and the necessary fixtures for the same. All the capital is owned by residents of the town.

9. Of the product of the bee-hive factory 25 per cent. remains in Louisiana, the balance goes to Texas, Mississippi, and Florida, mainly to Texas. The sugar produced in the sugar-mills is shipped to New Orleans, to be thence distributed throughout the country, only 12 per cent. remaining in Louisiana.

14. The cane used in the sugar-mills comes wholly from the parish of Iberville. The lumber used in the bee-hive factory is mainly cypress lumber, obtained from the saw-mills in Plaquemine, which is only a few miles north of the town.

16. About 300 tons of freight were received by river from the south during the year 1886, mainly merchandise, grain, and fertilizers.

17. The river receipts from the north were 200 tons, consisting of flour, meal, grain, meat, hay, etc.

18. The shipments by river south were 1,000 tons, mainly of sugar and molasses, worth $70,000; shipments by river north, 150 tons of sugar and molasses, worth $7,350.

19. There were no receipts or shipments by rail during 1886.

22. The rail rates are about 25 per cent. cheaper than by river, but it is generally more convenient to ship by the latter route, as the railroad is some distance from the town, and the cost of hauling offsets this difference.

23. The rates to Saint Louis are the same summer and winter; 50 cents per dry barrel, 60 cents per barrel of molasses, and $1.50 per hogshead of sugar.

24. The town of Bayou Goula is situated in Iberville Parish, on the west bank of the Mississippi River. The Texas and Pacific Railroad runs about three-fourths of a mile back of the town. Bayou Goula has no history worth speaking about, having gradually sprung up from a plantation shipping point.

25. There have been no recent improvements in the town. The retail sales amount to about $175,000, made mainly to negroes on the neighboring plantations.

26. Supplies are received almost wholly by river from New Orleans and Saint Louis.

27. The trade of the town extends for about 10 miles around it.

28. The number of steam-boat arrivals will average about 440 each year, of a tonnage of 220,000.

PLAQUEMINE.

1. The population of the town of Plaquemine is 3,500, and of the parish (Iberville) about 2,000.

3. There are nine wood-working factories in the town, one shingle-mill, one planing-mill, and two saw-mills.

4. There are in the immediate vicinity of the town, but outside of its corporate limits, five more shingle-mills and three saw-mills, besides some eighty sugar factories. The principal industry of the town is the manufacture of lumber and lumber products. It dates from 1854 when an enterprising creole named Mayot erected a primitive saw-mill there and began turning out some 3,000 or 4,000 feet a day, used exclusively in the town. Plaquemine lies at the mouth of Bayou Plaquemines, connecting the Mississippi and the Atchafalaya. Behind it are immense forests of cypress on Bayous Des Glaires, Maringouin, Grosse Tête, Pigeon, Sorel. In 1869 the Wilbert cotton-gin was transformed into a saw-mill, producing some 10,000 feet of lumber a day. This mill was so successful that in 1876 Mr. Wilbert erected another for the manufacture of lumber and shingles, with a capacity of 40,000 feet a day. In 1882 another mill, with improved machinery, was erected. Then began the manufacture of shingles on a large scale, and the introduction of a branch of the lumber industry which to-day sends its products throughout the entire country. In 1884 the Plaquemine Lumber and Shingle Company organized, with both a saw-mill and a shingle factory. Up to 1883 the shingles and lumber of Plaquemine were entirely consumed at home; now the greater portion of them is shipped to other points. Only "heart" cypress is used in these various manufactories, both of the lumber and the shingles. Of the industries other than lumber and shingle mills, the principal is a steam cistern and tank factory, manufacturing mammoth cattle-ranch and railroad water-tanks of a capacity ranging as high as 200,000 gallons. They are made of heart cypress, and are used mainly in Northern Texas and the dry States. Attached to the Wilbert saw-mill is a sash and blind factory.

5. In 1883 2 shingle-mills were established; in 1884, 1; in 1885, 1; in 1886, 2. Of saw-mills, 1 was established in 1870, 1 in 1876, 1 in 1885, and 2 in 1886.

6. The product of the town per year is 100,000,000 shingles and 20,000,000 feet of lumber.

7. Value of shingles, at $2 per 1,000, $200,000; lumber, at $12 per 1,000 feet, $240,000. Total production of town, including other articles, $500,000; capital invested, $250,000.

8. About four-fifths of the capital is owned in Plaquemines.

9. The lumber is sold mainly in Texas. Of the shingles one half go to Texas; the other half to the States north of the Ohio, mainly Iowa, Illinois, Pennsylvania, Nebraska, and Kansas.

10. About 25 per cent. of the lumber is consumed in the State. Nearly all the shingles go out of Louisiana, and not over 5 per cent. are used there. The trade in shingles by river is increasing very rapidly to Saint Louis, Cincinnati, and Pittsburgh.

11. About 55 per cent. of the freight goes by rail (the Texas and Pacific Railroad) either north to Texas or south to New Orleans. About 45 per cent. is shipped by river to Saint Louis, Cincinnati, and Pittsburgh, by the Cincinnati and Saint Louis boats.

12. There is an average of about 50 hands in each factory.

13. The annual wages paid are $240,000.

14. The raw materials are obtained from the cypress swamps in Iberville and neighboring parishes, mainly from Iberville, in a radius of 20 miles around the town. They are floated down to the mills via Bayou Plaquemines.

15. The Mississippi in front of the town is always navigable. Low water in the upper Mississippi and in the Ohio, by stopping the boats, cuts off a portion of the Northern trade.

16. The receipts of freight by river from the South are 1,095 tons per year.

17. The receipts from the North are about the same, and consist of flour, forage, meal, and Western produce.

18. About 6,000 tons—5,000 of lumber and 1,000 of shingles—were shipped south by river in 1886; value of lumber, $25,000; shingles, $10,000.

19. The mills ship by river 40,000,000 shingles north and 4,000,000 feet of lumber.

21. They ship by rail about 40,000,000 shingles and 20,000 feet of lumber. This goes by the Texas and Pacific Railway to Texas, Kansas, Nebraska, Missouri, Iowa, and Illinois.

22. The railroad rates to Saint Louis are 25 cents per 100 pounds; by river to the same point, 12½ per 100 pounds on shingles and lumber.

23. There is no difference in rates between summer and winter.

24. The town of Plaquemine was incorporated in 1836. About ten years after, in 1846, many new buildings were erected for stores and residences, and from that time until the outbreak of the war it was a great resort for the planters who lived in the neighborhood, on the Mississippi above and below, and on Bayous Plaquemines, Jacob, and Grand River. Since 1882 the town has advanced rapidly in population and industry in consequence of the development of lumbering. Plaquemine lies in the center of the largest belt of cypress timber in the South. This timber has grown in favor for shingles, cisterns, and wherever a wood is needed that could resist rot by water, and with the use and the erection of new saw-mills, nearly all of which have been established in or around Plaquemine since 1882, it has rapidly grown, and is estimated to contain 3,500 people to-day, against 2,061 in 1880.

25. During 1886 two large saw mills were erected in Plaquemine, a steam cistern factory, a large hotel and fifty buildings, including a number of stores. The mercantile business of the town has about held its own despite two bad crops in the parish.

26. Flour, potatoes, bacon, and forage are obtained mainly from Saint Louis, but some small amounts from New Orleans, Louisville, and Cincinnati. Coffee is obtained from New Orleans. These supplies are received by the Mississippi River, the Texas and Pacific Railway, and a small amount by the Louisville, New Orleans and Texas Railroad, which runs on the other side of the river, nearly opposite the town.

27. Shingles and lumber are sold as far east as Pittsburgh and as far west as the western limits of Kansas and Nebraska, and also to El Paso, Tex. All other freight is distributed within the parish by the Texas and Pacific Railroad.

28. The steam-boats landing at Plaquemine in 1886 were 1,000, of an average tonnage per boat of 500 tons. Before the building of railroads these landings would have been 3,000 yearly.

BATON ROUGE.

1. The population of the town is about 10,000, and of the parish about 20,000.

2. The factories are as follows:

Sugar refinery	1
Saw mills	2
Ice factory	1
Cotton-seed oil factory	1
Yarn factory	1
Cotton gins	8
Grist mill	1
Blind and sash factory	1

There are several brick yards, foundry, boiler and machine shops, etc.

3. These factories were established at various times in the last forty years. The yarn factory was organized in 1881, and put into operation with several hundred looms for the manufacture of cotton yarn. The cotton-seed oil mill has a capacity to crush 25 tons of seed daily and is second in Louisiana to the New Orleans mills. The sugar refinery was

organized in 1883 with a capital of $110,000, in a handsome building six stories in height and of proportionate length and width.

8. The capital engaged in these manufactures is owned almost entirely in Baton Rouge except the cotton-seed oil mill, which was lately purchased by the American Cotton Seed Oil Trust, of New York.

9. The products are distributed generally throughout the country. Most of the product of the cotton-seed oil mill go to New Orleans for shipment, thence either abroad or to New York, Providence, and other points.

11. These products have several routes to markets, and are transferred either by way of the Mississippi River and its tributaries, or by the Texas and Pacific, Louisville, New Orleans and Texas, and the Grosse Tête, Baton Rouge, and Opelousas, or the Louisiana Central Railroad.

12. The total number of hands engaged in the various manufacturing industries of Baton Rouge is 700.

13. About $275,000 annually is paid in wages.

14. The raw materials are obtained from the neighboring country, principally from the parishes of East and West Baton Rouge. The cotton and cotton-seed used in the yarn and cotton-seed oil factories and sugar in the sugar refinery are produced in the parish or neighboring parishes. Some of the timber used by the saw mills is floated down from above, out of the Ouachita and Red Rivers, averaging about 10,000,000 feet a year. The town ships about 400,000 feet of lumber and 1,000,000 shingles annually by river and 3,000,000 feet of lumber and 1,000,000 shingles by rail. The shipments by river are increasing.

22. The rail and water rates from Baton Rouge, which were formerly in favor of the latter routes have latterly been about the same for either.

23. There is no difference in rates in summer and winter.

24. Baton Rouge is the third oldest settlement in Louisiana, and is reckoned to be about one hundred and sixty years old. Its name, which in English means "Red Stick," is said to be due either to a large cedar growing on the site of the town, or to a stick painted red, which marked the division line between the territory of two tribes of Indians. Baton Rouge was first occupied by the French in 1720. It passed in 1763 to England. In September, 1779, Galvez, then Spanish governor, marched against Baton Rouge, occupied by about 400 English, and besieged the town, which, after a brief but vigorous resistance, surrendered to him. After the purchase of Louisiana by the United States, Baton Rouge, which was then a part of West Florida, remained in possession of the Spanish. In September, 1810, the American settlers in the neighboring parishes rose, attacked and captured Baton Rouge, and established the republic of West Florida. A few months afterwards it was formally annexed to the United States.

The town was incorporated in 1820, and progressed steadily, becoming the State capital in 1847. During the war it was occupied alternately by the Federals and Confederates, and on August 5 was the scene of a short but severe battle between the forces of Generals Williams and Breckinridge. The State-house was burned in December, 1862, while used by the United States troops as a prison, and the seat of government was transferred to New Orleans, where it remained until 1880, when it returned to Baton Rouge. It contains the State-house, blind asylum, deaf and dumb asylum, agricultural and mechanical college, penitentiary, and other public buildings, all of them handsome structures.

25. There was no increase during 1886 in manufactures, but the city has had a slow but steady and marked increase in buildings, population, and general commercial business.

26. Supplies are received by the Mississippi River, Texas and Pacific Railroad, a branch of which runs to Port Allen (on the other side of the river, with which connection is made by ferry), the Louisville, New Orleans and Texas, and the Louisiana Central, or Grosse Tête, Opelousas and Baton Rouge Railroad.

27. No other city competes with Baton Rouge in the circumscribed area, which affords all its trade to the town, by the routes already mentioned, and extending over a radius of about 40 miles. It commands not only almost the entire trade of the parish of East Baton Rouge and that of Livingston, east of it, but a portion of East and West Feliciana, Iberville, and Ascension, and that of West Baton Rouge, on the opposite side of the river.

28. Nearly all the passing boats stop at Baton Rouge and the landings are about 1,800 a year.

BAYOU SARA.

1. Bayou Sara has a population of about 1,200. With the town of Saint Francisville, the population of these twin cities, which are nearer and more closely connected than Minneapolis and St. Paul, is over 2,000. Bayou Sara lies immediately on the river

bank, protected by a levee, and is the commercial town. Above, on the bluff, is Saint Francisville, which is the seat of justice of the parish.

2. The parish of West Feliciana has a population of about 14,000.

3. Bayou Sara has extensive lumber interests. Its annual output is put down at 1,000,000 feet and 600,000 shingles, for which a ready market is found.

15. Bayou Sara is one of the most important river towns. It is at the head of what is known as "the Lower Coast," a number of packets running between it and New Orleans; it is the transfer point for freight for the Red, Ouachita, and other tributary streams, the mouth of the Red being a few miles above; it is the terminus of the West Feliciana Railroad, running 26 miles into the interior to Woodville, and which, being without any other connection, brings its freight to Bayou Sara for shipment to market and carries back supplies to the farmers; and it is the landing-place of the Ohio River coal fleet, the point from which the coal in barges is distributed to all the surrounding country. These several facts unite to make it a commercial center of greater importance than its size or population would seem to indicate. The arrivals and departures are more numerous than at any other town between New Orleans and Vicksburg.

The West Feliciana Railroad, which runs from Bayou Sara to Woodville, is an old road that has been in existence forty-five years. It is wholly without other railroad connections, and is tributary to the Mississippi. It has brought to Bayou Sara in the last four years 55,564 bales of cotton, received from West Feliciana Parish, Louisiana, and Wilkinson County, Mississippi. This is an average of 13,891 bales received by rail each year. There are received by other routes—mainly by wagon from the surrounding country—13,000 bales, making the total shipment of cotton by river from Bayou Sara 26,891 bales annually, being more than any other town between New Orleans and Vicksburg. Similarly it receives supplies for Wilkinson County and the parish of West Feliciana from the New Orleans, Saint Louis, and Cincinnati boats. The most important receipts are 9,750 barrels of flour; 40,000 barrels of cornmeal; 500 barrels of grits; 300 barrels of rice; 600 barrels of molasses; 900 barrels of sugar; 650 barrels of liquor; 600 barrels of coal oil; 1,250 sacks of coffee; 25,000 sacks of corn; 21,000 sacks of oats; 1,700 rolls of bagging; 3,000 bundles of cotton ties; 7,500 barrels of pork; 1,300 sacks of bran; 200 sacks of salt, and 30,000 miscellaneous packages.

The coal fleet intended for the Red and other rivers tributary to it and for the upper coast anchors here. The sales of coal from Bayou Sara amount to 7,500 tons annually, and of ice, from the ice barges, 800 to 1,000 tons. The wharf-boat, at which all the steamers land, does a large transfer business for Red River, the Atchafalaya, Black, and Ouachita Rivers and Bayou Teche. The Saint Louis and Cincinnati boats deposit at the Bayou Sara wharf-boat such articles as are destined for these streams, which are carried up by the Red River and other packets. Of this transfer trade from the North, seven-eighths is from Saint Louis and one-eighth from Cincinnati.

Besides the upper coast packets plying between New Orleans and Bayou Sara, all the Vicksburg, Saint Louis, and Cincinnati boats stop on their trips. There is also a line of mail-boats running between Bayou Sara and Natchez.

24. Bayou Sara dates back to the days of Spanish rule. It received a great impetus from the construction of the West Feliciana Railroad in 1842, and became from that time forward an important point on the river. The town was not incorporated, however, until 1850. Its history has been generally uneventful since then.

25. Bayou Sara controls the trade of West Feliciana, and of a great portion of Wilkinson County, Miss.; it also does some business with Pointe Coupée opposite. In addition, as already noted, it enjoys a business in certain lines with all the upper coast, and some transfer business as the shipping point lying nearest to the mouth of Red River.

FORT ADAMS.

1. The population of the town is 200, of the county (Wilkinson) about 10,000.

2. There are no manufacturing establishments in Fort Adams.

15. Fort Adams is dependent wholly on the river for its freights, as that is the only route by which it can procure goods, and the closing of the river has a very depressing effect on business.

16. All freight goes by river, and includes all classes of goods. The shipments are about $300,000 annually. The shipments south are principally cotton, about 4,000 bales for 1886, but the average shipments are 5,000 bales.

19. Very little is shipped North, nothing but some hides, furs, etc. There are prospects of other shipments North in the early future, as other markets are opening up trade with the cotton buyers in turn.

22. The town is wholly dependent on water transportation, having no railroad nearer than 36 miles.

23. The summer and winter rates from Saint Louis are: Pork, 75 cents; by barrels, 50 cents; grain, wheat, and hay, 25 cents per 100 pounds; groceries, 60 cents per 100

pounds. From New Orleans, pork, 40 cents; grain, 25 cents per sack; sugar, 40 cents per barrel; meal and flour, 30 cents per barrel.

24. Fort Adams is quite an old town. It has its name from Jackson's war in 1812, when he built here a fort of brick, most of which is still standing. Before the late war it was quite an important business center, but since that time the river has been leaving the town by the formation of a large bar in front of it, and the town has grown very little in size. With the improvement of the river here, it would increase in business and population.

25. There are eight business houses. There is no wholesale trade; it is altogether retail, amounting to some $80,000 or more a year. There is iron ore in the hills around the town, but it has not yet been opened up.

26. The supplies consumed in the town come principally from Saint Louis in the grocery line, and from New Orleans for dry goods and shoes. Some trade of all kind is done with Natchez and Bayou Sara, both about 50 miles distant, north and south.

27. Natchez competes with Fort Adams, and the trade of the latter town is restricted to a region of some 10 or 15 miles around it.

28. Before the war Fort Adams was the terminus of several packet lines. Since the war the boats have always done well here. The steam-boat arrivals this year have greatly fallen off in consequence of the opposition of the railroads at competing points.

NATCHEZ.

1. Population of the town about 10,000.

2. Population of the county between 18,000 and 20,000.

3. There are nineteen important manufacturing establishments in Natchez. The Natchez cotton mill is one of the largest and most prosperous in the South, manufacturing cotton yarn, cloth, and batting. It has 300 looms, 10,000 spindles, and 300 hands, paying wages of $48,000 annually, and consuming from 3,000 to 4,800 bales of cotton. Among the goods manufactured by it are sheetings, shirtings, drill, and brown cotton. The total output is 5,000,000 yards.

The Rosalie cotton mills manufacturing the same class of goods, consume annually 3,000 bales of cotton and pay out $36,000 in wages.

Two cotton-seed oil mills, the Carpenter Dick Company (Lee oil works), and the Adams Manufacturing Company are engaged in the manufacture of cotton-seed oil. Their daily crushing capacity is, Lee oil works, 45 tons of seed; Adams company, 40 tons of seed. Both of the mills are under the control of the American Cotton Seed Oil Trust. Each employs some 75 men; 2 iron and brass foundries, one of them a very extensive institution; the Natchez Cotton Company erected last year, at a cost of $75,000, and compressing 15,000 more bales of cotton this year than last, 2 cotton gins of large capacity, using steam power and employing many hands each; a batting mill, where the lint from the cotton seed is manufactured into cotton batting; 2 large lumber mills; an ice factory with a capacity of turning out 18 tons of ice every twenty-four hours; 2 mineral-water bottling establishments with a capacity each of 180 dozen bottles; a meal mill in connection with one of the cotton gins, and which does all the local grinding; a beer-bottling institution of large capacity.

5. Nearly all of these factories have been established since 1870. The Natchez cotton-mills were erected in 1877; the Rosalie mills in 1880; the Lee oil-mills in 1876.

6. The Natchez cotton-mills manufactured in 1886 5,000,000 yards of cotton cloth, and the Rosalie mills 3,600,000 yards of stripes and other miscellaneous cotton goods.

7. All of the capital invested in these mills is owned in Natchez. The two cotton-seed-oil mills were established by Natchez capital, but they now belong to the American Cotton-seed Oil Trust of New York.

9. The bulk of the goods manufactured in the mills is distributed in the North and West. This is so of the products of the cotton-mills. The oil cake and meal produced by the cotton-seed-oil mills are shipped to New Orleans for export.

11. The oil cake and meal goes to New Orleans, partly by river and partly by the Natchez, Jackson and Columbus Railroad and the Louisville, New Orleans and Texas.

13. The total amount of annual wages paid is $360,000.

14. The raw materials consumed in the mills came from the surrounding country; largely from Adams County. The Natchez, Jackson and Columbus Railroad, however, brings cotton, cotton-seed, and other products from counties along the line of the road between Natchez and Jackson.

15. River navigation is never closed.

16. The receipts of freight by the river from North and South include, from the South, coffee, sugar, rice, coal, oil, cotton ties, and some supplies; from the North, coal in barges, and provisions of all kinds. The receipts in tons were, from North, 16,300; from South, 10,200; shipments to North, 7,250, to South, 12,100. The shipments were

mainly of cotton, cotton-seed oil and products, and a small proportion of the manufactures of the Natchez mills.

22. *Rates of freight on heavy goods to New Orleans by river (distance 270 miles).*

Oil cake and meal	per long ton	$2.55
Cotton-seed oil	per barrel	.40
Cotton:		
Compressed	per bale	.40 to .50
Uncompressed	do	.65

Rates of freight on heavy goods to New Orleans by rail (distance 215 miles).

Oil cake and meal	per long ton	$2.25
Cotton-seed oil	per barrel	.50
Cotton:		
Compressed	per 100 pounds	.13
Uncompressed	per bale	.75

Rates of freight to interior points (no river competition).

To Fayetteville, Miss. (26 miles):		
Meal and flour	per barrel	$0.40
Heavy pound-freight	per 100 pounds	.20
To Utica, Miss. (74 miles):		
Meal and flour	per barrel	.50
Other heavy freight	per 100 pounds	1.00

Natchez was formerly wholly a river town, doing all of its business by river. Now three-fourths of it is handled by rail. The Natchez, Jackson and Columbus, as yet its only railroad, transported in 1886 42,650 passengers. It brought to Natchez 41,090 bales of cotton, and forwarded east 5,717 bales. It carried 4,059 tons of cotton-seed, 1,037 tons of cotton-seed oil, and 1,071 tons of domestics, and including lumber and machinery handled during 1886 50,000 tons of freight.

24. The city of Natchez is the oldest on the Mississippi, antedating New Orleans by some years. The site was selected by Bienville himself in 1700, when Fort Rosalie was erected here. In 1722 settlers were brought there from New Orleans. The French garrison, however, were on bad terms with the Indians, and in 1729 occurred the Fort Rosalie massacre, in which nearly all of the inhabitants were slain. The French revenged themselves by the extermination of the Natchez tribe, from which the city is named. The town continued to be a French military post until 1763, when it passed into the hands of the English, when the name was changed from Fort Rosalie to Fort

Panmure. In 1779 it was taken possession of by Spain as a part of Florida and held until 1797, when a rectification of the line between the United States and the Spanish colonies threw it into the former country. In 1798 Mississippi was organized as a Territory, with Natchez as its capital; indeed nearly the entire population of the Territory was congregated in the immediate vicinity of Natchez. From that period Natchez enjoyed great prosperity, and was one of the most important commercial centers in the Southwest. It carried on an immense wagon trade with the interior, and the entire country east of Pearl River and north of Claiborne and Copiah Counties to the Louisiana line was tributary to it. The first steamer was built to run on the Mississippi between Natchez and New Orleans. A branch of the United States Bank was established in Natchez, and a State bank, the Bank of Mississippi, was also established there in 1809. The first forty years of the present century were the most prosperous in the history of the town, which had the reputation of being as enterprising and progressive as any town in the country. Fortunes were made there rapidly, and some of the leading merchants in Philadelphia, Saint Louis, New Orleans, and even Liverpool, received their commercial education there.

A cotton compress was built as early as 1838, only six years after the first compress in New Orleans. Sailing vessels of good size, instead of getting their cargoes at New Orleans, frequently ascended the river as high as Natchez, and were loaded there with cotton for England and the Eastern cities. About this time, too, the first cotton-seed-oil mill ever erected was built at Natchez, but it did not prove a success, and the manufacture of cotton-seed oil was postponed for some years. In 1836 the people of Natchez began the construction of a railroad to Jackson, and had completed 35 miles of it when the financial crash of 1837 interrupted work. The crash of 1837 and the great tornado of 1840 set Natchez back, and it was a long time in recovering from these disasters. The planters in the neighboring country had formed business connections in other cities, and the plantation business of Natchez was reduced to a minimum. It became, however, a place of residence for many of the planters of Southern Mississippi, but lost its commercial importance. The construction of the Natchez, Jackson and Columbus Railroad, built wholly with home capital, gave the first new impulse to a spirit of enterprise, which resulted in the erection of two large cotton mills, two mills for the manufacture of cotton-seed oil, two founderies, a cotton compress, an elevator from the river to the top of the high bluff on which the city stands, and a number of minor manufacturing establishments.

22. Rates by river and rail fluctuate. When the river is low, freight by it advances, and the railroad rates also advance. For cotton-seed oil and similar products the rates by river are slightly less than by rail, to offset the cost of insurance. The railroad during the present year has offered exceptionally low rates, equal on through cotton, to barely 35 cents a bale, a very low rate, as it has to be transferred, going from Natchez to Jackson or Harriston, and being there transferred to the Illinois Central or Louisville, New Orleans and Texas Railroad.

26. Mercantile supplies are obtained by rail over the Natchez, Jackson, and Columbus Railroad, and by the Mississippi, both from the North and South. There are two boats weekly for Saint Louis and two for Cincinnati. There are two lines which ply between New Orleans and Natchez, and two local lines, the Natchez and Vicksburg and the Natchez and Bayou Sara Packet Companies. The Natchez, Jackson and Columbus Railroad extends a distance of 99 miles to Jackson. On the opposite side of the river at Vidalia is the Natchez, Red River and Texas Railway, which has proved valuable to Natchez by opening up the Louisiana country west of it.

26. Supplies are received from New Orleans, Vicksburg, Memphis, Saint Louis, and Cincinnati. A large amount of coal is brought to Natchez from Pittsburgh, the surrounding country being supplied from it as a coaling center.

27. The trade of Natchez extends to the mouth of Red River in the south, 70 miles to the north, and 75 miles east. In this territory it meets with some competition from New Orleans, Vicksburg, and other river cities, Vicksburg being its most important rival. Natchez also does some business on Bayous Maçon and Tensas, over the Natchez and Texas Railroad, running from Vidalia opposite to the Tensas.

VIDALIA.

1. The town of Vidalia is the parish seat of Concordia Parish, and is on the west bank of the river, immediately opposite Natchez. It has a population of 700 and the parish of 18,000. There are no manufacturing establishments in the town.

15. The Mississippi River affords cheap and easy communication with both Saint Louis and New Orleans. When it is closed above the town receives its freight by rail

through Natchez, by the Natchez, Jackson and Columbus Railroad and the Louisville, New Orleans and Texas, or Illinois Central.

16. The freight from the south consists of bagging, ties, sugar, coffee, and molasses, averaging 250 tons per year, worth $50,000.

17. From the north are received by river all the staple and fancy groceries, dry goods, notions, and hardware, about 750 tons.

18. The shipments south by river during 1886 were 1,950 bales of cotton and 29,250 sacks, or 1,462½ tons, of cotton seed, making a total of 1,950 tons, worth $102,000.

22. The rail route is much more expensive than by river, as the freight has to be ferried across to Natchez, thence shipped by the Natchez, Jackson and Columbus, and transferred to some other road.

23. The summer rates by river are, on meat, 35; flour, 35; corn and oats, 17½ cents per 100 pounds from Saint Louis. In winter they are the same, unless the river is frozen above, when they are from 15 to 20 cents higher on barrels, and 10 to 12½ cents on corn and oats.

24. The town of Vidalia has been built up gradually and slowly since the war, from furnishing advances to the negro planters working places on shares in the neighborhood, and also largely on account of its being the parish seat of justice.

25. The amount of business done each year is $100,000. There are no improvements going on, but a falling off in trade and general depression in business.

26. Supplies are received by boat mainly from Saint Louis, New Orleans, Chicago, and Cincinnati. They come by rail via Natchez when the river is frozen.

27. Natchez, which is immediately opposite, competes with Vidalia, and seriously affects its business. There is no front trade on the river, that being monopolized by Natchez; but for 25 miles back, both up and down, Vidalia enjoys some business. A railroad, the Natchez, Red River, and Texas, runs back from the town a distance of 16 miles, giving it communication and business with the settlements on Black and other rivers.

28. The steam-boat arrivals during the last ten years have averaged between 250 and 350 per year, most of them heavily laden for points below.

RODNEY.

1. Rodney is situated in Jefferson County, Miss., about midway between Natchez and Vicksburg.

2. The town has a population of about 500; the county, Jefferson, of 20,000.

3. The chief manufacturing establishments are a cotton-seed-oil mill, the Rodney oil-mills, a cotton-gin, and a saw-mill. The cotton-seed-oil mill was erected in 1884 and has a capacity of crushing 12 tons of seed to day.

4. The value of the product was $9,500 in 1884, $12,000 in 1885, and $15,000 in 1886. All the capital is owned in the town. The bulk of the product, oil, cotton-seed meal, etc., is shipped to New Orleans for export. The product of the saw-mill is mainly for home consumption, but of that of the oil-mills only one-twentieth is used at home or in the vicinity, the remainder being shipped to New Orleans.

11. The products are all sent by boat, Rodney being without any railroad connections whatever, and go south to New Orleans.

12. The oil-mills have twenty-five operatives and pay $7,000 in wages per year. The material used, cotton seed, comes altogether from the country immediately around Rodney.

15. The river is never closed at Rodney.

22. The rates by river to New Orleans and by rail via Vicksburg are about the same. All the products, however, go by river, as the other route is longer and slower. The rates are the same summer and winter.

24. Rodney is a quiet little town, formerly directly on the river; but a change in the course of the latter has left it inland, and it is now 3 miles to Shipping Point, from which all freight is sent and received. This change has been made by the formation here of a bar in the river twenty years ago. Rodney was formerly a much more important place in the river commerce than it is to-day, and had its regular line of packets to New Orleans. It is to-day dependent upon the Vicksburg and New Orleans packets, which land regularly, and the Saint Louis boats, from which a large portion of the supplies needed are received.

25. The retail business of the town amounts to about $200,000 per year. Its distributive trade extends in a radius of 12 to 15 miles through the country.

26. The steam-boat arrivals now number 468 a year, about one-half what they were in former years,

VICKSBURG.

1. Vicksburg has a population to-day of 18,500. The city census last year showed a population of 15,347 within the city limits, and 2,100 in the suburbs, making a total of 17,487, against 11,813 in 1880. Most of the gain has been within the last few years.

2. Vicksburg has 3 saw and planing-mills, 1 carriage and wagon factory, 1 spoke factory, 3 factories for making sashes, doors, and blinds, 2 oil mills, 2 soda and mineral water factories, 3 foundries, 2 copper, tin, and sheet-iron workers and manufacturers, 1 boiler-maker, 1 electric light establishment, 1 ice factory, 1 meal mill, gas-works, brick-yards, marble yards, and the main shops of the Louisville, New Orleans and Texas Railway, employing in all about 1,100 skilled laborers. All these industries are making money. The meal mill has a capacity of 400 barrels a day. The spoke factory deals in Alabama, Mississippi, Louisiana, and Texas.

The saw-mills find a market all over the South, and the sash, door, and blind factories fill orders in the heart of New Orleans.

The principal manufacturing enterprises are the Refuge Oil Mill, lying just south of the city; the Spingler Saw-mill and Sash and Blind Factory, using timber from the surrounding country; the Florence Ice Company, the largest in the State; the Mattingly Roller Mills, established in 1886; the Hill City Mineral Water Factory; the electric light company.

8. Nearly all the capital engaged in these several manufacturing enterprises is owned in Vicksburg. The gas company is controlled by Philadelphians.

9. The manufactures of the cotton-seed oil mill are sent mainly to New Orleans for export; most of the other manufactures are consumed in the State or neighborhood.

14. The raw materials are obtained from the neighboring country. Large quantities of cotton seed are brought down the Yazoo, Sunflower, and other tributaries for the cotton-seed oil mill.

Receipts by river for 1886.

Apples, onions, and potatoes	barrels	1,734	Meat	boxes	10,18
Beer	casks	376	Meal and grits	barrels	26,186
Bran	sacks	4,242	Molasses	do	267

The principal commercial business of the town is the handling of cotton, large quantities of which come to Vicksburg from the Yazoo River and by the railroads. During the season of 1884–'85 the gross receipts of cotton were 198,625 bales, and net receipts 40,991 bales. During the season 1885–'86 they were 220,274 bales gross, 51,221 bales net. These are for the cotton seasons, September 1 to August 31. For the last year, January 1 to December 31, 1886, the cotton trade, receipts and shipments, of Vicksburg was as follows:

Receipts during 1886.

	For the city.	For reshipment.
	Bales.	*Bales.*
Mississippi River	4,489	16,320
Yazoo River	7,856	40,614
Vicksburg and Meridian and Louisville, New Orleans and Texas Railroads	20,695	
Vicksburg, Shreveport and Pacific Railroad		127,125
Estimated wagons, etc	13,000	
Total	46,040	184,059

	Bales.
Receipts of cotton:	
By rail	147,820
By river	69,399
Shipments from city:	
By rail	*39,769
By river	*8,396

Cotton receipts at Vicksburg from September 1, 1886, *to July* 9, 1887.

From—	City.	Reshipping.
Yazoo and Sunflower Rivers, etc	8,211	30,557
Mississippi River	4,619	12,474
Louisville, New Orleans and Texas and Vicksburg and Meridian Railroads (about)	20,443	
Vicksburg, Shreveport and Pacific Railroad (brought over from Delta)		110,000
Wagons and other sources (estimated)	13,000	
Total	46,273	153,031

"City" includes cotton stored in presses for sale.
"Reshipping" includes cotton passing through which is reshipped.

	Tons.
Shipments of cotton from Vicksburg presses this season:	
Rail	37,292
River	8,252

*This includes only the Vicksburg, that is, the cotton pressed and handled there, not that passing through the town.

Until within the last few years the bulk of Vicksburg's business was done by the river, and it was the most important river point between New Orleans and Memphis. The trade of the town in 1879 was estimated as follows:

Shipments (mainly cotton and cotton seed)	$9, 250, 000
Receipts (supplies, etc.)	2, 250, 000
Total	11, 500, 000

The building of the railroads, and particularly the Louisville, New Orleans and Texas, has diverted a considerable portion of the trade from the river, but the latter is still important and the number of arriving and departing steam-boats is 925 a year.

Several years ago a number of prominent capitalists of Vicksburg obtained a charter from the legislature of Mississippi and under it organized the Vicksburg Wharf and Land Company, which secured all the land below Vicksburg upon the river, giving it a front of over a mile and a half and controlling what is known as the lower landing. Here the various boats plying the river trade land, and here the transfer is made across the river by the Vicksburg and Meridian and by the Vicksburg, Shreveport and Pacific Railroads.

24. Vicksburg was settled in 1836 and incorporated in 1840. It was a prosperous river town long before the civil war, the home of many of the wealthiest planters in the South. Early in the struggle the importance of Vicksburg as a strategic point was recognized by both sides. The fall of New Orleans in 1862 gave the Federals virtual possession of the Mississippi River up to Vicksburg, down to which operations had also cleared the way from above. On the 18th of May a portion of Farragut's fleet, under Capt. S. P. Lee, appeared before the city and demanded its surrender, which was promptly refused. Every effort was made by the Confederacy to retain a strong force here. Ten thousand troops garrisoned Vicksburg at this period. On the 28th of May General Williams, who had occupied the opposite side of the river, attempted, by means of a dug canal, to leave the city high and dry, but the uncertain stream declined to desert the city, and the scheme was a failure.

After a vain bombardment, on the 28th of June, Farragut's fleet was compelled by falling water to descend to New Orleans. General Sherman's operations from the Yazoo quarter were equally fruitless. Grant's attack on the 19th of May, 1863, was repulsed, but he invested the city with a force of 70,000 men, while the fleet co-operated from the river.

On the 3d of July, of the same year, after enduring for forty-seven days and nights the horrors of bombardment, and menaced by the pangs of hunger, Vicksburg, through General Pemberton, in command of the town, was allowed honorable terms of capitulation.

In 1866 the town suffered severely from a disastrous fire, which destroyed a vast amount of property.

In 1876 the Mississippi River cut through the Louisiana peninsula opposite the town, just below the place at which General Grant attempted to dig his canal, rendering the town inaccessible to steamers except in high water, and it seemed certain that its rich river commerce would be destroyed. A great depression fell on the town. Values were greatly depreciated; real estate fell off to one-fourth its value, and large houses in business centers which had formerly brought $150 to $200 a month were rented at $15 to $20 a month, or in many instances were left tenantless. A forest of willows grew up in the former bed of the river in front of the town. The population fell off from about 15,000 in 1876 to 11,814 in 1880.

The first symptoms of reviving confidence was when Congress made an appropriation for the revetment of the stump of the peninsula to check the river, which had been steadily cutting it away and receding from the town. This was successfully done by the United States engineers, and the harbor is now fixed at the southern limits of the town.

A large sum has been appropriated by Congress for the improvement of the harbor of Vicksburg and also for diking above Delta. There was another large appropriation for the harbor of the town in the late river and harbor bill that was lost. It is estimated that a canal from the present current in the river to the town could be obtained at a total cost of $300,000, which would greatly improve and increase the river facilities of Vicksburg.

In 1883 the Louisville, New Orleans and Texas Railway was built, passing through the heart of the Yazoo Delta and restoring to Vicksburg much of her lost trade. Since then the town has been steadily advancing.

Real estate has nearly recovered its former value and is steadily advancing, mills and other industries have been successfully started and cotton receipts have increased 25 per cent.

Within the past year new buildings have gone up as fast as carpenters could be employed; two new banks have been opened; the streets have been paved or graveled; a street railroad has been built; the main shops of the Louisville, New Orleans and Texas Railway have been located here, which will add 500 skilled laborers to the population; a $10,000 race-course and fair-grounds has been constructed; the city has been lighted by electricity.

The railroad connections of the town consist of the Louisville, New Orleans and Texas or Mississippi Valley route; the Vicksburg and Meridian Railroad, a connection of the Cincinnati, New Orleans and Texas Pacific system; and the Vicksburg, Shreveport and Texas Pacific Railroad, running from Delta, immediately opposite, to Shreveport.

A large amount of business crosses the river by rail at this point. The following table gives the number of passengers and the tons of freight ferried across the Mississippi at this point:

Vicksburg and Delta transfer.—Statement of freight and passengers transferred between Vicksburg and Delta and Vicksburg and Meridian, and Vicksburg, Shreveport and Pacific Railroads in 1886:

Months.	Number of passengers carried.		Tons of freight transferred.	
	East.	West.	East.	West.
January	842	1,200	4,369	2,684
February	801	813	4,002	3,383
March	753	896	1,618	2,966
April	523	577	1,468	6,195
May	*420	*461	*267	*1,278
June	655	632	1,084	1,710
July	811	758	556	3,779
August	852	713	1,128	3,719
September	825	846	1,505	3,600
October	914	882	5,391	4,693
November	1,086	1,019	6,344	4,331
December	1,111	1,374	9,130	4,762
Total	9,593	10,173	36,862	43,100

*Low lands in Louisiana overflowed.

The advent of the Louisville, New Orleans and Texas Railroad has done wonders for the city, enlarging the area over which its business extends, expediting transportation north and south, and practically counterbalancing the decrease of river facilities. Here is a statement of the growth of the city:

Population in—

1850	2,678
1860	4,591
1870	12,443
1880	11,000
1887 (estimated)	18,500

Assessment of city property, real and personal—

1885	$3,150,000
1886	3,500,000
1887	3,750,000

Capital invested, as shown by privilege licenses, between $3,000,000 and $4,000,000.

MAYERSVILLE.

1. The town of Mayersville is in Issaquena County, Mississippi. It has a population of 400, and the county of 10,000.

3. There are no manufacturing establishments in the town, which is altogether commercial, the shipping point for the large cotton crop of the neighborhood.

15. When the upper river is closed and boats can not reach Mayersville from Saint Louis and Cincinnati, supplies are sent by rail from these cities to Vicksburg, and shipped up stream from that point by the local or New Orleans packets.

23. The rates from Saint Louis are: dry barrels, 50 and 60 cents; pork, 75 and 90 cents; meat, 25 and 30 cents.

24. Mayersville was a portion of a cotton plantation in 1870, when it was purchased by D. Mayer, after whom the town was named, laid out and incorporated. It has 2

white churches, 12 stores, the court-house and buildings for the county officers, being the seat of justice in Issaquena.

25. The amount of sales in 1886 approximated $100,000.

26. Supplies are received altogether by the river, as the town is without railroad connections. From Saint Louis they come mainly by the Anchor line; from New Orleans by the Pool line; and from Vicksburg by the local packets running between that town and Greenville.

27. The distributive trade of Mayersville is confined wholly to a portion of Issaquena. At a short distance both above and below, Greenville and Vicksburg compete.

GREENVILLE.

1. Greenville, the metropolis of Washington County, contains a population of 5,000.

2. Washington County has a population of 40,000.

3. It contains 2 cotton-seed-oil mills, 1 cotton compress, 2 saw-mills and lumber factories, 2 steam brick factories, 1 carriage and wagon factory, 2 iron founderies, 1 cotton-gin and grist-mill, one planing and lumber-dressing mill, and the shops of the Mississippi division of the Georgia Pacific Railroad.

4. There are no other factories in the county besides those in Greenville, except a few saw-mills.

6. All the mills are in active operation. The cotton-seed-oil mill has a capacity of 120 tons of cotton-seed per day. The cotton compress has a capacity of 50,000 bales per year.

7. The amount of capital invested in these manufactures is about $350,000. About one-half of it is owned in the State. The cotton-seed-oil mills are owned by the American Cotton-Seed Oil Trust of New York.

9. With the exception of the oil mills all of the products are for local sale and consumption. The oil is exported mainly via New Orleans.

11. The products of the oil mill are shipped largely by the Louisville, New Orleans and Texas Railroad. Of the cotton compressed in the Greenville press about 4,000 bales go to New Orleans via the Louisville, New Orleans and Texas Railroad and 10,000 via the New Orleans, Greenville and Bend packets.

12. The number of operatives employed in the various factories is 350.

13. The total amount of wages paid annually is $125,000.

14. The raw materials used in the mills are obtained altogether from the country immediately adjacent to Greenville and mainly from Washington County.

15. When the river navigation is bad it enhances the rate of freight, but the changes are very small from one season to another.

17. The freight from the North is mainly meat, breadstuffs, and general merchandise, about equally divided between the railroads and boats.

18. About 10,000 bales of cotton were shipped south by river in 1886, of a value of about $450,000.

19. About 30,000 bales of cotton were shipped north by river, and cotton-seed oil, of the value of $1,500,000.

21. The largest item shipped from Greenville by rail is cotton to the Eastern mills. About 15,000 bales, of the value of $700,000, are thus shipped.

22. The rates by rail and river are about the same.

23. The rates by river are as follows:

		Cents.
Cotton to Cincinnati	per 100 pounds	11
Cotton to New Orleans	do	13
Grain and provisions from Saint Louis	do	20
Grain and provisions from Memphis	do	17½

24. The town of Greenville was laid out in 1868 in the Blantonia plantation. It was incorporated in 1870, and increased rapidly in business and population. It is the capital of the Mississippi levee district and geographical center of the Yazoo Valley. The town is well laid out, with wide streets, crossing each other rectangularly, and well shaded by cottonwoods. The country around it is one of the most fertile and productive in the Union, Washington County being the banner cotton county in the United States. A complete levee system protects the land from overflow, and it is rapidly settling up by means of immigration.

The town has important trade connections. It is the terminus of the New Orleans and Greenville Packet Line, which comes here for the cotton and cotton-seed raised in Washington and neighboring counties. A steamer also runs between Vicksburg and Greenville. The Louisville, New Orleans and Texas Railroad reaches Greenville by a branch line that runs from Leland southward to Lake Washington. It is proposed to extend this branch southward to meet the main stem of the road at Rolling Fork, which

would considerably shorten the distance between Greenville on the one hand and Vicksburg and New Orleans on the other.

Another railroad with a terminus at Greenville is the narrow-gauge portion of the Georgia Pacific Railroad, which runs fron Greenville east to Johnsonville. The road will soon be altered to standard gauge and completed to Columbus.

25. The total commerce of the town for 1886 was about $10,000,000. The volume of trade in all lines is increasing.

26. Supplies are received from Saint Louis, Kansas City, and New York by the Mississippi River and the Louisville, New Orleans and Texas Railroad.

27. The trade of Greenville extends for a radius of 50 miles around the town. Vicksburg and Memphis compete with it in this region, but it still holds a large portion of this trade.

Greenville has suffered severely from caving in the river bank, which has compelled the houses on the river to be moved back several times. The citizens propose to raise $50,000, which they think will protect the river bank until an adequate appropriation can be made by Congress.

ARKANSAS CITY.

1. The population of the town is about 1,000; and of the county about 20,000.

3. Arkansas City contains 2 factories; the county (Chicot) 3; 1 stave manufactory; amount of capital unknown.

5. In 1887.

6. None.

7. Capital invested, $500,000. No product in 1886.

8. One of the companies has only local capital; the capital in the other is altogether foreign, mainly from Boston.

9. The manufactures are distributed throughout the United States and sent to all foreign ports.

10. All the products are shipped out of the State.

11. The shipments are mostly via the Mississippi River.

12. In one factory 20 hands are employed; in the other, 60.

13. About $40,000 is paid in wages.

14. The materials used are obtained from the forests surrounding Arkansas City.

15. The river is always open.

16. The town ships about 4,500 tons of cotton and mixed freight; value unknown.

17. About 4,500 tons of cotton and mixed freights.

18. Shipments about equal to receipts.

21. The freight shipped to all points in 1886, amounted to about 10,000 tons, including cotton, staves, lumber, and mixed freights.

22. Rates are regulated by competition and the stage of water, there being usually no material difference between the river and rail rates.

23. The town of Arkansas City was incorporated and made the terminus of the Little Rock, Mississippi River and Texas Railroad in 1876, having then a population of 250. It soon advanced to 1,000 people. Several disastrous fires and overflows retarded its growth, and it remained at that figure for a number of years. In 1886 it was protected from overflows by the levees, and both the town and the country around it have been improving steadily ever since.

25. The mercantile business of the town is $250,000; shipping and necessary business, $500,000.

26. Supplies are obtained from many points, but particularly from New Orleans, Saint Louis, and Memphis.

27. The trade of the town is almost entirely retail, and is confined to the immediate territory extending for a radius of 25 miles around it. It is an important shipping point, receiving a large share of the products of interior Arkansas and Kansas, destined for New Orleans and some other river points.

28. The steam-boat arrivals of the last ten years will average ten boats per week, and the tonnage shipped for that time would be about equal to that of 1886, or from all sources about 24,000 tons.

HELENA.

1. The population of Helena is between 4,500 and 5,000.

2. The population of Phillips County, in which Helena is situated, is between 18,000 and 20,000.

3. The manufacturing establishments in the town are: 1 cotton-mill—there were two until a short time ago, but they have been consolidated into one—1 saw-mill, 1 foundry, 1 ice factory, 1 cotton-gin, and 1 cotton compress.

The mill below Helena saws wholly for export, using walnut, red gum, ash, and poplar. It was built in 1852, and was one of the pioneer mills in the lumbering industry in the State.

The Anchor Oil Mill, which is one of the largest and most complete in the South, was built in 1877. It employs 50 hands and crushes 50 tons of seed per day.

8. About half the capital invested in manufactories is owned in the town; the other half in the North and West.

9. The lumber is shipped almost entirely to the North, going largely to Illinois. The oil manufactured by the cotton-seed oil-mill is also shipped North, but the cake and meal goes South to New Orleans for shipment to Europe. The ice and other products are used at home, although some of them are shipped by river and rail to neighboring plantations.

10. Very little of the manufactures of the town except the ice and a very small portion of the lumber is consumed in Arkansas. The great bulk is shipped away.

11. The shipments are made by rail and river, but mainly by the latter route.

12. The oil-mill has 75 hands, the saw-mill, 60; ice factory, 10; cotton compress and gin, 25.

13. About $140,000 is paid per year in wages.

14. The cotton-seed used in the oil-mill is obtained from the neighboring country, and largely by rail and river. The timber for the saw-mill is floated down from the St. Francis Swamp.

15. Navigation of the river is seldom closed by ice except for a few days, and never by low water.

17. About half the freight from the North comes by river.

18. There are shipped South on the average, by river, 20,000 bales of cotton annually, and some of the products of the cotton-seed oil-mill, about 16,000 tons in all.

19. The shipments North by river include some 10,000 bales of cotton, some lumber and the oil from the mill, or 17,200 tons.

20. Since the completion of the branch of the Iron Mountain Railroad to Helena nearly all the meat, dry-goods, etc., come by rail; the flour comes mainly by river.

21. A large amount of the lumber is shipped by rail. Other rail shipments are goods sold in the county by Helena merchants.

22. Previous to the passage of the interstate-commerce law most of the freight from Saint Louis to Helena came by railroad; since then, however, a majority of it has come by river. The railroad has latterly reduced rates, and it is probable that business will go back to its old conditions.

23. There is no difference in summer or winter rates, as navigation is equally good at either season.

24. Helena is situated on the west bank of the Mississippi, about one degree south of Memphis, from which town it is distant 90 miles by river. It is built on and at the foot of Crowley's Ridge, at the point where this peculiar formation ceases. It is the highest point on the west bank of the Mississippi south of Commerce, Mo. The hills are about 500 feet from the river, and the town is situated partly in the bottom and partly on the hills. It was named some sixty years ago.

25. The town is growing slowly but surely, and has made great advance in the last few years. To utilize the plateau in front of the hills and render it safe from overflow the people of Helena some years ago, by the tedious process of hauling, brought earth from the hills and raised the grade of streets on the front 8 feet. The merchandise sales of the town are estimated at $1,250,000.

26. The meat consumed in the town and neighborhood comes mainly from Kansas City by rail. Most of the other goods come from Saint Louis and New York, and are received by rail and river. The flour comes mainly by river.

27. The trade of Helena extends around the town some 30 miles by rail. Most of the river trade in the neighborhood is enjoyed by Memphis merchants.

28. The annual arrivals of steam-boats at Helena are 1,095. In former years they were double or three times what they are to-day.

Helena possesses three railroads, the Helena branch of the Iron Mountain Railroad runs from Helena in a northerly direction and intersects the Memphis and Little Rock Railroad, 90 miles east of Little Rock, and 45 west of Memphis.

The Mobile and Northwestern Railroad, chartered in 1870, extends from Glendale, Miss., opposite Helena, westward. The road hauls a large quantity of cotton to Helena.

The Arkansas Midland Railroad extends from Helena westward.

MEMPHIS.

1. The city of Memphis has a population of 75,000, and is growing at the rate of 10,000 yearly.

3. Memphis has 11 cotton-seed oil-mills, more than any city in the world, and 6 flour and meal mills, with an output of 1,500 barrels per day, and miscellaneous industries of all kinds. It employs 3,600 hands in its factories, pays $1,200,000 in wages and turns out products of the value of $6,000,000.

The steam-boat business of Memphis in 1886, while not as good as that of previous years, compares well for 1886 with 1885. Memphis was one of the few river towns at which there was no positive decline, notwithstanding the competition of railroads. The business was limited to the regular packet lines and there was no competition among the boats except in the White River trade, where an opposition boat forced down freights to 2 or 3 cents, less than enough to pay for handling them.

The principal lines engaged in the Memphis traffic are the following:

Saint Louis and Mississippi Valley Barge line; Memphis gave this line about 20,000 tons of freight, including cotton, oil, meal and cotton-seed oil, nearly all of which was destined for transportation to Europe.

Saint Louis Anchor Line, embracing both the New Orleans and Vicksburg boats, *City of New Orleans, City of Saint Louis, City of Natchez, City of Baton Rouge, Annie P. Silver, City of Cairo, City of Vicksburg, City of Providence, Arkansas City, Belle of Memphis, and Will S. Hays.*

Southern Transportation Line, running between Cincinnati and New Orleans, composed of six steamers. These boats did little business with Memphis during the season, being generally fully loaded after passing Cairo. On their up-stream trips they discharged a few lots of sugar, molasses, and other articles from New Orleans.

The Memphis and Ohio River Packet Company, composed of five steamers, ran two boats a week, making ten-day trips. These boats were of light draught and managed to keep up communication nearly the entire season. They took north 35,680 bales of compressed and 5,154 bales of uncompressed cotton, 34,399 sacks of cotton seed, 2,855 barrels of cotton-seed oil, and much miscellaneous freight.

The Memphis and New Orleans line, composed of two vessels, did a lighter business than ever before, taking only 6,000 bales South. This was due to the exceptionably favorable railroad rates from Memphis east. These boats, however, brought into Memphis large quantities of cotton seed to be crushed in the mills.

The Saint Francis River Transportation Company consisted of two vessels running as far as the Bald Knob Railroad, some miles above Wittsburg, when the water was high enough for it.

The Memphis and White River trade employed four boats, one of them being an "independent."

The Arkansas River Packet Company ran three boats. During the busy season all three of them were employed, two of them running from Memphis to Pine Bluff, the other between Pine Bluff and the mouth of White River, carrying and reshipping cotton for New Orleans. This trade was interrupted during January by the river freezing.

The Memphis and Vicksburg Packet Company kept two steamers busy.

Lee Line, three steamers, one of which was destroyed by fire.

Memphis and Scanlons, one steamer.

Memphis and Tiptonville, one steamer, which brought to Memphis 3,508 bales of cotton, 1,933 bags of seed cotton, 25,079 sacks of cotton seed, 29,330 sacks of corn, 1,911 head of stock, 282 sacks of peanuts, and 4,123 packages of sundries.

Memphis has now in operation nine lines of railroads, as follows: The Chesapeake, Ohio and Southwestern, to Louisville, and thence to Chesapeake Bay; the Louisiana and Nashville, distance to Louisville 377, to Nashville 232 miles; the Memphis and Charleston, to Chattanooga, 310 miles; the Louisville, New Orleans and Texas, to New Orleans, 455 miles; the Mississippi and Tennessee, connected at Grenada with the Illinois Central to New Orleans; the Memphis and Little Rock Railroad, to Little Rock, 125 miles; the Kansas City, Springfield and Memphis Railroad; the Bald Knob Railroad.

Through these steam-boats and railroad companies Memphis has greatly extended its trade latterly.

Kansas City, Saint Louis, Louisville, and New Orleans, each some 400 miles distant, are its nearest rivals and competitors. Memphis controls the trade of nearly half of Tennessee, a considerable portion of Alabama, and more than half each of Arkansas and Mississippi, together with large portions of other States beyond these.

24. A century ago the bluff on which Memphis now stands was in the possession of the Chickasaws, who gave it the name of "Chickasaw Bluffs." It is the only high bluff on the river between Vicksburg and the mouth of the Ohio River. In the year 1783 Governor Gayoso, of Louisiana, erected here a fort known as "Fort Saint Ferdinand," at the mouth of Wolf River. The Spanish held possession of the fort until 1802, when it was transferred to the United States. General Wilkinson, commanding the United States forces, dismantled Fort Saint Ferdinand and built Fort Pickering, 2 miles further down. The original owner of the site of Memphis was a man by the name of John Rice, who obtained a grant of 5,000 acres of land, covering most of the present site of the town.

In 1819 General Andrew Jackson and General James Winchester, becoming owners of this tract, in partnership with John Overton, who had purchased Rice's claim, planned the city, which was incorporated in 1831. The population in 1840 was 3,360; in 1850,

8,841; in 1860, 22,623, and in 1870, 40,226. The epidemics of 1878 and 1879 affected the town disastrously, and it had actually a smaller population in 1880 than in 1870. The city became hopelessly insolvent, and in 1879 had its charter repealed. In place of the old city government the Taxing District of Shelby County was inaugurated, the affairs of the city being placed in charge of seven leading citizens, called commissioners of fire and police, besides the president of the Taxing District. Memphis went to work zealously and actively to correct its defects. Miles of Nicholson pavement were torn up and the streets repaved with stone. Old shanties, which were supposed to harbor fever germs, were destroyed or burned, with all the furniture in them that had been contaminated by the scourge. A new system of drainage was introduced, and as a consequence Memphis soon became one of the best drained cities in the Union, was free from sickness, and entered upon a new era of progress and prosperity far exceeding anything that had been dreamed of in the past.

25. Memphis is the largest interior distributing market of groceries and provisions in the Union, in proportion to population. It sells yearly:

Products.	Amount.	Products.	Amount.
Cotton	$30,000,000	Cotton seed and oil products	$1,564,185
Provisions	3,494,046	Lumber	248,779
Grain	1,073,499	Fruits	83,772
Dry goods	6,207,200	Miscellaneous products	104,721,674
Boots and shoes	2,406,845		

The following, from the official figures of the Merchants' Exchange, gives the receipts and shipments of the town during the year 1886:

Articles.	Receipts.		Shipments.	
	Quantity.	Estimated value.	Quantity.	Estimated value.
Apples ... barrels	33,509	$83,772.50	22,087	$55,217.50

COASTWISE TRAFFIC TO AND FROM NEW ORLEANS.

What is the amount and value of the coastwise traffic to and from New Orleans?

There is less known to-day of the coastwise trade of New Orleans than of any part of the commerce. Whereas formerly, as long as the Price Current was in existence, some records were kept of the shipments made to coastwise ports and the cotton received from Mobile, Galveston, and other towns on the Gulf, these statistics have been dropped since the disappearance of that paper and there are absolutely no figures whatever attainable on this subject. Hence it is not to be wondered at that this traffic should have increased from year to year until it now very nearly equals the foreign trade of New Orleans, without attracting comment, and, indeed, without this fact being generally known.

The coastwise trade of New Orleans is now infinitely larger than it was ever before, and in proportion to the value nearly as large relatively as in the earlier days of the city.

At the time that President Jefferson purchased Louisiana the trade of New Orleans was almost wholly with the American colonies, and consisted in the shipment in American vessels to the towns of the Atlantic seaboard of the produce of the vast interior country, the basins of the Ohio and the Mississippi. The merchants of Philadelphia had been the first to establish agencies in New Orleans; and Philadelphia, as a consequence, received the bulk of this trade. Next in importance ranked Boston and Baltimore, while New York, Charleston, Newport, and other seaboard towns did some business with "the Crescent City." In the first years of the acquisition of Louisiana the coastwise trade largely exceeded the foreign commerce, and of the vessels arriving at and leaving the port of New Orleans from three-fourths to five-sixths were American. Cotton for Europe had not yet become the principal article of export; but sugar, flour, pork, and similar produce were shipped to the people of the Atlantic cities and States. The vessels engaged in this business were small schooners and sloops of 250 tons or thereabouts, in handling which the American seamen of that day could not be excelled.

It was not until 1830 that the foreign exceeded the coastwise commerce of New Orleans. As that city became more a cotton port, and as the cotton was shipped mainly to Europe, the value of its foreign exports increased more rapidly than those to American ports; and in the season 1829–'30 (from September 30 to October 1) stood ahead as follows:

Exports, 1829–'30:

Coastwise	$8, 357, 788
To foreign ports	9, 868, 328

The coastwise traffic has grown steadily since, but it has never caught up with this foreign trade, although the prospects are more favorable for this to-day than ever before. During the ten years 1832 to 1843 the coastwise traffic of New Orleans grew as follows:

Years.	Coastwise shipments.	Years.	Coastwise shipments.
1832–'33	$9, 057, 614	1837–'38	$14, 910, 093
1833–'34	9, 930, 086	1838–'39	14, 509, 313
1834–'35	10, 915, 560	1839–'40	21, 960, 859
1835–'36	13, 533, 923	1840–'41	15, 274, 776
1836–'37	15, 115, 705	1841–'42	19, 443, 787

The period that followed is regarded as the most prosperous in the commercial history of New Orleans; but the main increase in the trade was with foreign countries, and the coastwise shipments gradually sank to less than a third of the total business. The opening of the Erie, Ohio and Pennsylvania Canal and the building of railroads made the river and ocean route through New Orleans no longer the absolute necessity it had been, and there was a striking decline, relatively if not in the aggregate, in the shipments of all kinds of Western produce. Towards the latter portion of this period the two items of cotton and sugar constituted the far greater portion of the products exported from New Orleans to the Atlantic and Gulf cities.

Shipments.

Years.	Coastwise.	To foreign ports.	Total.
1845–'46	$19,149,741	$28,211,569	$47,361,310
1846–'47	24,790,825	32,707,582	57,497,407
1847–'48	27,733,601	39,448,732	67,182,333
1848–'49	28,383,753	37,008,818	65,392,571
1850–'51	27,228,915	53,988,013	81,216,928
1853–'54	30,695,466	68,392,660	99,088,126
1854–'55	22,994,958	60,656,785	83,651,743
1855–'56	28,031,391	55,088,827	83,120,218

The figures, it will be seen, are given only of exports for and imports from coastwise ports. No statistics have ever existed or indeed exist up to this day. In this trade New York and Boston disputed about evenly for the first place, with Philadelphia third, Baltimore fourth, Providence (R. I.) fifth, Charleston sixth, and Portsmouth seventh. Taking the era when New Orleans most controlled the Western produce trade, the shipments were to the following points (1845–'46):

Ports.	Flour.	Pork.	Bacon.	Lard.	Beef.	Lead.	Whisky.	Corn.
	Barrels.	*Barrels.*	*Hogsheads.*	*Kegs.*	*Barrels.*	*Pigs.*	*Barrels.*	*Sacks.*
New York	83,854	88,288	2,873	204,323	5,162	309,681	4,098	172,186
Boston	122,148	89,164	846	139,364	3,501	139,364	150	259,523
Philadelphia	250	29,785	1,238	70,113	99	70,113	647	3,671
Baltimore	.....	19,523	729	11,961	446	11,961	2,175	1,000
Charleston	11,476	2,828	1,962	5,607	275	4,620	8,982	87,953
Other coastwise ports	68,441	13,434	12,720	20,671	4,490	8,460	41,869	175,582

Ten years later the increase to the four leading ports was:

Ports.	1856–'57.						
	Flour.	Pork.	Bacon.	Lard.	Beef.	Whisky.	Corn.
	Barrels.	*Barrels.*	*Casks.*	*Kegs.*	*Barrels.*	*Barrels.*	*Sacks.*
New York	141,494	46,628	2,979	183,688	5,527	1,956	26,087
Boston	241,466	53,725	2,728	57,303	10,387	8,925	55,322
Philadelphia	.....	.....	9	.....	.....	849	.....
Baltimore	.....	3,847	.....	1,480	.....	356	.....
Other coast ports	141,142	18,874	25,631	17,941	366	46,884	204,608

Ports.	1855–'56.						
	Flour.	Pork.	Bacon.	Lard.	Beef.	Whisky.	Corn.
	Barrels.	*Barrels.*	*Casks.*	*Kegs.*	*Barrels.*	*Barrels.*	*Sacks.*
New York	131,591	60,632	4,124	154,788	14,147	1,762	77,906
Boston	200,179	52,624	4,373	122,216	13,998	4,454	195,660
Philadelphia	.....	.....	.....	1,533	.....	67	5,049
Baltimore	.....	4,565	.....	.....	.....	187	.....
Other coast ports	108,686	30,707	24,648	26,351	1,346	51,402	113,262

New York at that time ranked second in the receipt of these goods, second or third in the receipts of cotton, and led only in sugar.

The coastwise tobacco trade declined with the building of railroads even more than that in Western produce. It had amounted to 18,509 hogsheads in 1827–'28, and had risen to 20,343 in 1834–'35, but during the fifties it declined to the following low figures:

	Hogsheads.
1852–'53	9,521
1853–'54	4,794
1854–'55	7,447
1855–'56	9,156
1856–'57	8,632

New Orleans still remained an important center for tobacco, but mainly for foreign purchasers, the tobacco reaching the Atlantic ports going by rail or canal.

The shipments of sugar were made to all the American ports. New York led in the receipts of this article, with Philadelphia second, Baltimore third. All the chief New England ports, as well as Norfolk, Charleston, Savannah, and others on the South Atlantic and Gulf coast also received large amounts of Louisiana sugar and molasses.

The coastwise cotton trade increased rapidly as New Orleans became more and more the cotton center of the United States. In the earlier days the shipments of cotton to American ports averaged from one-sixth to one-fifth of all exported, as follows:

Coastwise shipments of cotton.

Years.	Bales.	Years.	Bales.
1826–'27	66,763	1831–'32	64,728
1827–'28	86,283	1832–'33	94,223
1828–'29	41,017	1833–'34	60,705
1829–'30	56,116	1834–'35	122,484
1830–'31	135,086	1835–'36	92,535

In the height of the cotton period, when the Southern product was truly king in New Orleans, if nowhere else, the shipments from that town to the various coastwise ports were as follows:

Exported to—	1864–'65.	1863–'64.	1862–'63.	1861–'62.	1860–'61.	1859–'60.	1858–'59.

Total receipts at New Orleans	1,576,409	1,435,000	1,661,443	1,232,644	1,346,925	1,580,875	1,373,464

Up to the time of the war New York, it will be seen, ranked second in the receipts of cotton from New Orleans, and for a portion of that time was behind Philadelphia and Providence.

During the war period, New Orleans received its supplies largely and, indeed, mainly from New York, and even Western produce took this roundabout route in consequence of the blockade of the river. The few shipments it had to make of cotton and sugar took the same course, and the supremacy of New York in the coastwise trade of "the Crescent City" was firmly established, although it was some years before that town so monopolized the trade as it does at present.

With the end of the war the coastwise trade appeared to enter upon another period of prosperity.

The first year of peace saw the following shipments:

From the close of the war to the present time the coastwise trade of New Orleans has shown a marked tendency to gravitate wholly towards New York; that is, the reciprocal trade between these cities has increased steadily and rapidly at the expense of the business with the other Atlantic and Gulf ports; and thus, while the total coastwise trade of New Orleans has increased, the business with many of the towns has shown an actual decline. Note the drift towards New York of the cotton trade during the short period of eight years:

Exports of cotton coastwise from New Orleans.

Philadelphia and Baltimore, which had been the first to develop trade with New Orleans, drop altogether out of the list, while Boston and Providence, which had twenty years previously been well ahead of New York, handled together barely one-tenth as much as the American commercial metropolis.

The drift of the coastwise trade has been wholly towards New York, and that, with other American ports, has steadily and rapidly declined before it, until it has almost disappeared. Formerly a large majority of the cotton went to Boston and Providence. Now New York gets nine-tenths of the total shipments, and distributes the cotton to the New England factories. Similarly, the molasses and sugar imported went originally largely to Philadelphia and Baltimore. Now little reaches these towns. There has been no line between New Orleans and these ports for years, and vessels trade between them only occasionally when there is a load awaiting them. Most of these are sailing vessels, whereas the New York freight is carried on lines of the largest and finest coastwise steamers running in the American trade. With the Southern Atlantic ports, Savannah, Charleston, and Norfolk, there is no business at all, and whatever is received from those towns comes either by rail or is first shipped to New York, and thence redistributed and sent back to New Orleans.

The Gulf trade of New Orleans has also steadily declined for some years largely in consequence of the construction of railways, and the competition of New York and

other cities. Previous to the construction of the Mobile and New Orleans Railroad, in 1871, all of the Mobile cotton, which included a large portion of the crop of Alabama, reached New Orleans by vessels, generally through Mississippi Sound and Lake Pontchartrain. Even after the building of the railroad there was some competition on the part of boats, but this has latterly disappeared, and now a vessel seldom reaches New Orleans with a cargo from Mobile, there being but one such arrival in 1886. The business by water between the two Gulf ports is now confined almost exclusively to the shipment from Mobile of watermelons and garden truck; and even this is inconsiderable. Since the extension of the Louisville and Nashville Railroad to Pensacola and the building of the Pensacola and Atlantic in 1883, it has been the same with that town, from which now comes only a few small sailing vessels, engaged in the fishing and oyster trade. The Morgan or Southern Pacific steamers to Havana generally stop at Cedar Keys, Tampa, and Key West on their way to Cuba, and furnish a large portion of the supplies, provisions, and lumber used at these points. The railways to Tampa have somewhat decreased this business of late. The return trade in cigars, fruits, vegetables, etc., is small.

On the west the railroad connection with Galveston has practically put an end to ocean communication between the two ports. An occasional vessel runs from one to the other. The same is true of Corpus Christi, Indianola, Brazos Santiago, and Bagdad, through which formerly a large proportion of the products of Texas were shipped by water to New Orleans. The completion of the Texas system of railways has brought about the decay of this coastwise traffic. The Morgan steamers do some business with these ports, but it is generally via the railroad, and but little arrives at New Orleans direct from them.

This has left the coastwise trade mainly with New York, both in shipments and receipts. Some cotton and cotton-seed products are shipped to New England, and sugar, molasses, and rice to other Atlantic ports. The return receipts are coal from Philadelphia; ice and granite from New England; guano, railroad iron, building material, and a few other articles from the Atlantic and from the Gulf ports, namely, fruits and early vegetables.

But if this trade is limited, both in quantity and in variety, that with New York makes up for it all, and is of the most varied character. Through New Orleans passes the cotton (a portion of which is again reshipped at New York for Europe), sugar, molasses, rice, etc., of the South; wool, hides, tallow of Texas; fruits, wines, and other products of California; coffee, istle, etc., from Mexico, and products from all portions of the Pacific, whalebone, spermaceti, seal-skins, matting, etc. The return cargoes include nearly every variety of article produced or manufactured in the East and consumed in the South, West, or on the Pacific coast. It is this trade, of all in New Orleans, that has received the greatest impetus and made the greatest advance of late years. But a small share of it is handled in this town, the great bulk being merely transient and passing through New Orleans, being unloaded direcly from the steamer to the car or barge and carried thence to some interior point of destination. Not a small proportion of it comes in bond, and some of it passes on to Mexico. Thus a shipment is made from Europe to Mexico, passed through New York in bond, thence by ocean to New Orleans, and by rail to El Paso, to be thence carried across the Rio Grande.

The imports received in New Orleans from New York have one of five destinations inward: New Orleans, the Mississippi Valley, Texas, California, Mexico or some other foreign country.

The New Orleans trade includes some provisions, but especially manufactured goods, dry goods, cotton cloth, boots, shoes, hats, etc. A large share of it consists of foreign goods imported by way of New York; and this mode of importation may explain to some extent the apparent decline in the foreign import trade of "the Crescent City." That city receives, according to the report, a much smaller amount of foreign goods than during the years previous to the war. The truth is that it receives more, not direct, but through New York.

The shipment of goods from New York into the Mississippi Valley via the Atlantic has latterly increased marvelously. Nearly all the railroads centering at New Orleans receive a portion of the freight brought by the New York steamers, but the largest shipments are made by the barge line to Saint Louis. The movement was particularly marked just after the interstate-commerce bill went into operation, and it was welcomed as one of the effects of that legislation. These shipments are of a similarly miscellaneous character, and have latterly included carpets and all kinds of dry goods.

The largest share, however, of the imports from New York go west of the Mississippi, to Texas and California, by the Southern Pacific and Texas and Pacific roads and their branches.

The freight is wholly transit, going through New Orleans but not remaining there.

Indeed, the greater portion of it does not even reach the city proper, but is transferred directly from the steamer to the cars on the west or Algiers side of the river.

During the last few years the Southern Pacific, or Morgan Line, has added a number of steam-ships to the fleet, doubling its tonnage. The business has increased and the steamers come in, almost without exception, with full loads. The time between New York has been shortened from year to year, and indeed from month to month, and now averages less than six days. The ocean route is, therefore, as short for freight as by rail. The insurance is low, as there have been no losses in this trade for a long term of years.

Besides the regular steam-ship lines between the two cities, other vessels, principally ships and brigs, occasionally run. The cargoes carried by them, however, are mainly heavy products, lumber, rice, molasses, etc., from New Orleans, and slate and building materials from New York, but few of the finer manufactured goods being carried by these vessels.

The two lines between New Orleans and New York are the Cromwell and the Southern Pacific steamers. These are composed of the following vessels:

Names of lines and steamers.	Length.	Breadth.	Depth.	Tonnage.		When and where built.
				Gross.	Net.	
Cromwell Line.	*Feet.*	*Feet.*	*Feet.*

Algiers	281.0	38.1	20.2	2,827.34	1,305.48	Wilmington, Del., 1876.

The Cromwell line sends one steamer a week and the Southern Pacific two, making three weekly steamers between New Orleans and New York without including the irregular vessels running during the cotton season. As will be noted, four steamers of 14,000 tons have been added to this trade in the last five years.

The traffic has been largely developed by the railroads; indeed, as will be seen, one of the railroad lines controls a majority of the steamers running to New York. The others generally have some connection or arrangement either with the New York or European lines, and through rates can thus be made between points on the Pacific coast and Liverpool, Boston, and New York.

The four important trunk railroad lines constructed to New Orleans in the last six years were built in order to give their main stems, the Missouri Pacific, Southern Pacific, Chesapeake and Ohio, and Cincinnati Southern (or Cincinnati, New Orleans and Texas Pacific), a terminus on deep water on the Gulf, and thus secure the advantage of an ocean connection either with Europe, Central America, and the West Indies or New York and other coastwise ports.

The Southern Pacific Railroad by its purchase of Morgan's Louisiana and Texas road not only secured an entrance into New Orleans but control of an old and valuable steamship line connecting New Orleans with New York, Havana, and the Texas and Florida ports. These New York steamers serve as part of a transcontinental line from New York to New Orleans by ocean vessel, thence to San Francisco by rail. This line in particular has given an extraordinary impetus to the coastwise trade of "the Crescent City," which now ships a large amount of Texas and California produce, and receives in return goods of all kinds for these States.

As a consequence of this movement the coastwise tonnage of New Orleans has increased more rapidly of late years than its foreign tonnage. The port statistics of New Orleans show that during the year 1886 the tonnage of loaded vessels reaching New Orleans from foreign countries was below that from American ports. Of the former no less than 43 per cent. came to New Orleans in ballast, and of the remainder a large proportion came with small loads. When the cotton season begins the vessels crowd into New Orleans

from foreign ports to obtain loads; but more than half of them which came during that season arrive empty and go away with full loads, whereas there is little variation in the coastwise, and particularly with the New York trade, throughout the year.

The following gives a comparison of the foreign and coastwise tonnage for 1886:

Total movement of vessels.

Trade.	Entered.		Cleared.	
	Number.	Tonnage.	Number.	Tonnage.
Foreign	679	649,700	701	698,630
Coastwise	288	411,667	284	407,417

Movement of vessels with cargoes.

Trade.	Entered.		Cleared.	
	Number.	Tonnage.	Number.	Tonnage.
Foreign	436	369,077	684	693,810
Coastwise	288	411,667	284	407,417

Excess of coastwise tonnage entered over foreign in vessels with cargo 42,590

Movement of coastwise trade from 1880 *to present time.*

Year.	Entered.		Cleared.	
	No.	Tonnage.	No.	Tonnage.
1880	364	441,941	355	384,884
1881	290	408,591	291	367,710
1882	259	320,523	289	335,358
1883	289	296,520	278	303,775
1884	353	341,894	274	299,675
1885	291	364,617	242	364,185
1886	288	411,667	284	407,417

It will be noted that during the earlier years the entrances were generally larger than the clearances, due to the fact that many vessels came to New Orleans from coastwise ports and loaded there with cotton, etc., for foreign countries. The amount of freight carried, particularly imports, during all this period was less than it is to-day, the majority of the vessels coming here in ballast or only partially loaded.

Coastwise shipments from New Orleans for year 1885.

APPENDIX.

GENERAL RIVER FREIGHT TARIFF.

The complaints made in regard to the river rates induced the steam-boat men in 1883 to attempt to arrange matters more satisfactorily. At their suggestion a committee of merchants, representing the Cotton, Produce, and Sugar Exchanges and other commercial bodies, was appointed to frame a tariff of rates for the various lines of river trade centering at New Orleans. The committee met, devoted some time to the consideration of the matter, and finally promulgated the following tariff, which sought to establish a graded freight rate for points on the river proportionate to the distance traveled. It was hoped through this tariff to revive the river business, as loud complaints were made by the merchants against some of the rates then prevailing. The steam-boat men objected at first to this tariff, but finally accepted it. It was made just about the time the steamboats felt the immediate competition of the railroads built parallel to the Mississippi and the Red, and it has therefore been seriously amended since.

Tariff of freight.

[All agricultural implements returned for repairs at one-half tariff rates. Extra heavy machinery subject to special contract.]

Articles.	Way and forts.
Cooperage agreement:	
Planters' cooperage will be carried and a correct account will be kept of all empty packages delivered and all filled packages shipped back to New Orleans, and any excess must be collected from planter; hogsheads 20 cents; sugar barrels 5 cents; molasses barrels 10 cents. We require this in consequence of large lots of sugar and molasses being shipped by rail and boats not connected with us. The object is that we do not propose to charge any freight on cooperage where the same quantity of filled packages are shipped back by our boats. Regular rates, hogsheads 20 cents, sugar barrels 5 cents and molasses barrels 10 cents each, will be charged where coopers agree to deliver at plantations. Cooperage, knocked down half rates.

*No contract shall be made to purchase and deliver any goods that will net the boat less than full cost and card rates of freight.

UPPER COAST TARIFF.

This tariff went into effect in 1885 on the New Orleans and Coast Line for Baton Rouge, Bayou Sara, and upper coast points, not above Bayou Sara. It has been seriously affected by railroad competition. A discount from 10 to 30 per cent. is allowed all large shippers, and rates have been even lower to meet special railroad competition.

RED RIVER TARIFF.

Special revised high-water season freight and passenger tariff of 1880, as agreed upon by the joint committees of the Planters' and Merchants' Red River Transportation Company and the Red River and Coast Line, and adopted at New Orleans June 20, 1884, taking effect July 1, 1884, and continuing in effect when the Grand Ecore packet can make regular weekly trips between New Orleans and Grand Ecore.

This contract is to continue five years and apply only to business of stockholders and subscribers of the Planters' and Merchants' Red River Transportation Company and contractors with Red River and Coast Line.

Below the falls at Alexandria a discount of 10 per cent. is allowed on this tariff:

Freight tariff.

All sales made by boat must be at regular tariff rates.

Boats taking freights for points beyond their destination shall charge the full tariff rate.

Boats shall not charge less than the full rates of passage, to induce the shipment of freight.

Boats shall not pay any commission to shippers, to induce shipment of freight.

Boats shall have the privilege of taking cotton reshipped from other boats at less than regular card rates, from point of reshipment.

No freight bill made out for less than 50 cents.

Ten per cent. will be charged on all C. O. D. bills collected by the boat.

When C. O. D. bills are returned to shippers, freight will be charged both ways by the boat.

High-water minimum freight tariff.

OUACHITA RIVER HIGH-WATER MINIMUM FREIGHT TARIFF.

[Adopted January, 1885.]

All valuable letters must be charged for at the rate of 50 cents.

For amounts less than $200 and all amounts over $200 at the rate of one-quarter per cent.

All sales made by boat must be at regular tariff rates.

No freight bill made out for less than 50 cents.

When bills taken for collection are returned to shippers, freight will be charged both ways by the boat.

No C. O. D. bills to be taken by boats, but bills for collection can be taken at shippers' risks.

All freight for points above Ouachita City, charge the same as way freight.

Adopted by the New Orleans and Ouachita River Consolidated Line of Steam-boats January 1, 1885.

Children, over 13 years of age, full fare; children, 3 to 13 years of age, half fare; servants accompanying children steerage rates; dogs will be charged $4; not allowed in cabin, must be given in charge of the steward.

Round excursion tickets, $50; unlimited excursion tickets, $60.

Passengers from Puerto Cortez for Balize and New Orleans will take the steamer on her return from Puerto Cortez. They must procure tickets before going on board, and furnish their own conveyance to and from the vessel. Each full passenger allowed 150 pounds baggage free when packed in trunks. In consideration of which it is agreed that the line is not to be held liable or responsible for any loss or damage thereto, in any sum except when the same shall have been proven to have occurred from gross negligence of the line, or their servants, nor in any event shall the passengers demand beyond the sum of $100 at which said baggage is hereby valued, unless a bill of lading is signed therefor specifying the articles and their respective values. Passengers remaining on board after their arrival in port will be charged $1 a meal.

All passages must be paid in United States currency or its equivalent under all circumstances.

No single shipment taken for less than 50 cents unless otherwise provided for.

Bulk freights taken in car-load lots only, and are required loaded and unloaded by owner, and must be weighed on track scales, and freight assessed on actual gross weight, provided not less than minimum car-load allowance.

Perishable freight, including oysters, is at owner's risk, and must be prepaid or guarantied by responsible parties.

Fruits and vegetables when in mixed car-loads, 24,000 pounds and over, will take the car-load rates per 100 pounds, on each article, when from one consignor to one consignee and destination on same date.

Messengers accompanying bananas or live-stock on same train with one or more car-loads will be way-billed without extra charge.

Freight tariff from New Orleans to points on Leland branch of Louisville, New Orleans and Texas Railroad.

*Applies only to Memphis and Arkansas City. To Greenville and Huntington, use local tariff.

No single shipment taken for less than 60 cents.

Messengers accompanying bananas or live stock on same train with one or more car-loads will be way-billed without extra charge.

Articles in bulk taken in car-load lots only, and are required loaded and unloaded by owner, and must be weighed on track scales, and freight assessed on actual gross weight, provided not less than minimum car-load allowance.

Perishable freight, including oysters and fish, must be prepaid, or guarantied by responsible parties.

Fruits and vegetables when in mixed car-loads, 24,000 pounds and over, will take the car-load rates per hundred pounds, on each article, when from one consignor to one consignee and destination, on same date.

Local freight tariff between stations not otherwise provided for.

[Took effect April 1, 1887.—In cents per 100 pounds, and per barrel.]

* River competition.

FOREIGN TRADE OF NEW ORLEANS.

The following valuable tables in regard to the foreign commerce and the tonnage employed in the coasting trade of New Orleans are inserted here as a befitting conclusion to the report on the commerce of the Mississippi River, namely:

1. Statement showing the total values of imports into and exports from the customs district of New Orleans during each year from 1804 to 1887, inclusive.

2. Statement showing the total values of imports from and of domestic exports to the principal and all other foreign countries into and from the customs district of New Orleans during each year ending June 30, from 1869 to 1887, inclusive.

3. Values of the principal and all other articles of merchandise imported into and of domestic merchandise exported from the customs district of New Orleans during the years ending June 30, 1856, 1860, 1870, 1875, 1880, 1885, and 1887.

4. Statement of the registered, enrolled, and licensed tonnage belonging in the district of New Orleans, showing the tonnage employed in the coasting trade and in steam navigation, respectively, for each year from 1804 to 1869, inclusive.

5. Statement of the registered, enrolled, and licensed tonnage belonging in the district of New Orleans (distinguishing between sail and steam) for each year from 1870 to 1887, inclusive.

6. Statement showing the tonnage of American and foreign vessels entered and cleared in the foreign trade in the customs district of New Orleans from 1821 to 1887, inclusive.

7. Statement showing the tonnage of American and foreign vessels entered and cleared in the customs district of New Orleans from and for the principal and all other foreign countries during each year ending June 30, from 1871 to 1887, inclusive.

VALUES OF EXPORTS AND IMPORTS.

PART IV.

COMMERCE OF THE OHIO RIVER AND OF THE BRIDGES WHICH CROSS IT, FROM PITTSBURGH TO CAIRO.

By HENRY A. DUDLEY, *Louisville, Ky.*

INTRODUCTION.

The Ohio River, from its source at Pittsburgh to its mouth at Cairo, has a length of 967 miles, passing along the borders of six States and watering the shores of seventy-one counties, namely: Two in Pennsylvania, twelve in Virginia, thirteen in Ohio, twenty-five in Kentucky, fourteen in Indiana, and five in Illinois. Of its main tributaries the Muskingum furnishes an outlet for the commerce of a large portion of Central Ohio; the Kanawha opens to trade the broad forests, rich coal-measures and salt wells of West Virginia; the Big Sandy penetrates to the almost untouched and inexhaustible stores of coal and iron in Eastern Kentucky and Old Virginia; the Kentucky leads up to the very heart of the famed Blue Grass region, whence fine stock, tobacco, and whisky are sent to every market on this continent; the Green and Barren Rivers bear the products of Western Kentucky out upon the broader bosom of the Ohio; the Cumberland affords water carriage to six counties in Tennessee and three in Kentucky; the Tennessee traverses three States, and furnishes outlets to two counties in Alabama, five in Tennessee, and six in Kentucky. The Wabash reaches five counties in Illinois and six in Indiana. The confluent streams of the Allegheny and the Monongahela touch thirteen counties of Pennsylvania and one each in Virginia and New York.

The broad and fertile domain, teeming with industrious inhabitants and prosperous enterprises, known as the Ohio Valley, contains 214,000 square miles, and its navigable water-ways afford an aggregate of more than 4,000 miles open to steam-boat traffic. As has been fitly said: "Beginning with the coal, iron, oil, lumber, and salt of Western Pennsylvania, we have the iron, stone, oil, coal, grain, wine, and fruit of Southern and Eastern Ohio, the coal, iron, oil, timber, salt, and agricultural products of West Virginia, next to the flour, hay, corn, wheat, and produce of Indiana and Illinois, with the tobacco, whisky, hemp, grain, coal, and cotton of Kentucky, and Tennessee. It is all suggestive of 'A land flowing with milk and honey.' There is everything in this valley which could make another England, with the lumber of Norway, the wines and fruits of France, Germany, and Italy, and the cotton of India; in short, the productions elsewhere of empires and continents."*

The census of 1880 gives the population of this great valley as 2,440,339, and of the Ohio River drainage basin as 9,567,989. To all commercial intents the inhabitants of basins drained by the Ohio River's tributaries are properly included, which makes the grand total 16,663,261 for that census year, or almost equal to the entire population of five principal States of the Union. It is small wonder that, in 1880, the center of population of the whole United States was ascertained to be in the heart of this valley, and only 1 mile south of the south bank of the Ohio River.

General Humphreys, in his report on "The Physics and Hydraulics of the Mississippi," has much to say concerning the Ohio, and among other things states that this wide basin of 24,000 square miles receives an annual downfall of 20,700,000,000,000 cubic feet of rain, of which tremendous deluge 5,000,000,000,000 cubic feet is dis-

*Col. Thomas P. Roberts's report to engineer in charge of Ohio River improvements, 1868.

charged by the river at Cairo, the ratio of discharge to the rainfall being 0.24, which is greater than that of any other western river. From Pittsburgh to Cairo the fall of the river has been accurately ascertained to be 426,640 feet, the greatest fall being opposite Louisville, where it amounts to 21,866 feet in 2 miles.

These prefatory remarks will be sufficient to introduce the proper subject-matter of the present report upon Ohio River commerce.

A showing of the craft by classes and tonnage and port of registry, which carry the commerce of the Ohio River at present, should precede everything else relating to this branch of the subject. Singularly enough, full statistical records of these vessels can not be procured from surveyors of ports along the Ohio for a regular term of years, either because the points have not been regarded of special importance or by reason of the fact that ports have been opened to run a brief season only to be closed and their records transferred to other ports of more consequence. Thus an uninterrupted series of port statistics for the Ohio River, at least, has been rendered out of the question. A better system now obtains, and for the year 1886 the following official port lists are presented:

Port lists of steam-vessels on the Ohio River between Pittsburgh and Cairo, 1886–'87.

[1] The tow-boats here enumerated average three trips annually, at seasons of high water, conveying coal-flats and barges between Pittsburgh and New Orleans, and returning with empty barges. Empty coal-flats are sold on the lower Mississippi and broken up. It is impracticable to ascertain the tonnage of the tows drawn by each boat, as no record of same is kept, and the loads vary considerably with the stages of water. The tow-boats never carry any freight or passengers, save fuel, provisions, and crews.

Leaving for another part of this report the operations of the Pittsburgh coal and iron fleets, the trade of individual passenger and freight and ferry boats plying up and down the Ohio between Pittsburgh and Cairo, with their trips per week, passengers, and classified freights, has been gathered into the following table, which is based upon carefully collected estimates of officials connected with the boats themselves, or of masters of their wharves of call:

A schedule of average number of weekly trips, passengers, and freight tonnage of boats plying up and down the Ohio River, for 1886.

Name of boat	From—	To—	Average number weekly round trips.	Average number passengers per round trip.	Average number tons freight per round trip.

PITTSBURGH.

Pittsburgh, situated at the head of Ohio River navigation and the center of three great radiating railway systems, combines more geographical advantages than any other interior city of the Union. A recent writer* says on this point: "But 150 miles from the great chain of inland lakes, with all their advantages of intercourse with Canada and the Lake States, as well as access by that route to the ocean, she is distant only a day's travel from the important cities of the Eastern sea-board, and nearly central to the whole extent of the United States. Situated also in the heart of the bituminous coal formation of the Appalachian field, and apparently at the very fountain-head of natural gas, and equally advantageously located as to the deposits of iron ore, her geographical relations to the staples of Pennsylvania, as well as the Union, are unequaled." She reaches by river transportation eighteen States and two Territories, embracing an area of 1,052,000 square miles of territory. That portion of the country which derives its mercantile supplies and is at once dependent upon and tributary to Pittsburgh, comprises an area of 19,697 square miles, with a population given by the last United States census of 1,578,670 and products valued at $54,354,000, exclusive of manufactures.

GROWTH OF THE CITY.

Pittsburgh was founded on the 23d of November, 1753, by General George Washington, and a stockade, which was the germ of the future city, was erected in February following. Three months later the French forces took possession of the place and began the construction of Fort Duquesne. In February, 1758, the French evacuated in turn, and the position was occupied by British troops, who built a small military work on the east bank of the Monongahela and called it Fort Pitt, in honor of the English statesman, and thus christened the settlement. In 1788 the leader of a company of New England emigrants bound to Marietta, Ohio, who stopped for a few days at Pittsburgh, estimated the population of the town at 400 or 500, exclusive of a small force of soldiers who occupied old Fort Pitt. On the 22d of April, 1794, Pittsburgh was incorporated as a borough, and, by a census made two years later, had a population of 1,395. Decennial census tables, beginning with 1800, show the following population for the town:

Year.	Population.	Year.	Population.
1800	1,565	1850	46,610
1810	4,768	1860	49,217
1820	7,248	1870	86,076
1830	12,568	1880	156,381
1840	21,115	1887 (estimated)	205,591

A pamphlet, entitled "Pittsburgh and Allegheny in the Centennial Year," says:

"From 1817 to 1825 the city was at a standstill from effects produced by the termination of the war of 1812. In 1817 many factories stopped, and until 1821 there was a continual downward tendency in all business and property. In 1821 the distress appeared to have reached its height; manufactories, trade, and industry were all prostrated. In 1825 and 1826 the city began to rally, and in 1830 she was again prosperous. In 1837 she was, with other cities, retarded by the subsidence of the land speculation

*Col. George H. Thurston.

fever and the consequent panic. It will, however, be observed that notwithstanding these adverse years, from 1820 to 1830 there was an increase equal to 135 per cent., or 13½ per cent. a year; and that from 1830 to 1840 an increase of 129 per cent., or nearly 13 per cent. per year."

In the next decade the population increased 105 per cent. From 1850 to 1860, although the percentage of increase only slightly exceeded 61 per cent., the actual increase was 5,000 souls over that of the previous decade, and between 1860 and 1870 the actual increase of population was 65 per cent. greater than between 1850 and 1860.

In 1840 the census enumeration of the sister city of Allegheny, which from that date forward must be counted in as part of the population of Pittsburgh, as their interests are indissolubly connected, was 10,090, and by the succeeding decennial enumerations was shown to have increased as follows:

1850	21,262
1860	28,702
1870	53,180
1880	78,681
1887 (estimated)	94,565

The present population of Pittsburgh and Allegheny City, therefore, may be safely regarded as being not less than 300,000, with a real-estate holding valued at $175,358,766 or purposes of taxation.

MANUFACTURES.

Pittsburgh manufactures date back to the commencement of the present century, and have acquired a household significance with the teeming millions of the Ohio and Mississippi valleys. As early as 1803 the city supplied the army of western pioneers with axes, hoes, plow-irons, cow-bells, scythes, sickles, spinning-wheels and cards, pots, etc., to the value of $266,000. Now, as has eloquently been said: "There is nothing, in iron, from a steam-boat or locomotive to a tack that the iron-workers of Pittsburgh do not or can not make; nothing in steel, from a rifled cannon or armor for a ship to a watch-spring, that her steel-workers can not supply; nothing in glass, from window plates 10 and 15 feet square, so clear that but for its sheen there would seem nothing but air into which the gazer is looking, down to the smallest wine-glass, so fragile that it would seem to scarce bear the weight of a butterfly without dissolving as an air-blown bubble."

The Pittsburgh of the present time finishes a locomotive every second day, and makes a steel rail every minute throughout the year.

First and foremost under this head must be placed the manufactures that have made Pittsburgh most noted and that fully justify her American title of "The Iron City," viz, iron and steel production. A considerable space is necessarily required for this purpose, and no better historical synopsis of this great local industry can be presented than to quote the words of the author before mentioned, Col. George H. Thurston. He says:

"In 1811–'12 a rolling mill, so called, was erected at Pittsburgh by Christopher Cowan, an Englishman. It was without puddling furnaces, and did not roll bar-iron. A second mill was built in 1819, which was the first to roll bar-iron, and had four puddling furnaces. In 1824 the Juniata Mill was erected, which is still operated by the firm of Shoenberger & Co. In 1820, on the site of the present Ætna Mill of Spang, Chalfant & Co., at Pine Creek, a mill for the manufacture of scythes and sickles was built, which, in 1828, was converted into a mill where bar-iron was rolled from blooms. In 1825 the Sligo Mills were built on their present location. The Kensington Mill, originally the Dowlas, was also erected in the same year. In 1828 the Sable Mill was started, and in 1829 the Wayne Mill, and at this latter period Pittsburgh is credited with having nine rolling mills, using 6,000 tons of blooms and 1,500 tons of pig-iron, and employing 300 hands. In addition, there were nine nail factories, producing 18 tons of nails and employing 150 hands. In 1836 two more rolling mills were added, and at this time the annual product of the entire number of iron manufacturing establishments was $4,160,000."

In the business of iron casting Pittsburgh also early took place as a profitable field for enterprise and the investment of capital. So far back as 1806 the McClurg Air Foundry was busily engaged in casting iron pots, kettles, mill irons, etc., and in 1810 it is credited with having "cast 70 tons of cannon-balls for the United States," and a portion of the ordnance for Perry's fleet on Lake Erie was furnished two years later. In 1817 there were 4 iron foundries, employing 87 hands, and producing $180,000 worth of castings of various kinds. In 1828 this number had grown to 8, and in 1831 to 12, employing 132 hands and casting 2,963 tons of metal annually. In 1836

the foundries, engine and machine shops numbered 18, with an annual out-put valued at $2,130,000. In 1856 there were 32 foundries and machine-shops, with a yearly capacity of 66,900 tons, consuming 28,000 tons of pig-iron, employing 1,597 men, paying wages of $653,302, and placing on the market products valued at $2,880,000. At this date the rolling mills had increased to 25, consuming 140,000 tons of pig-iron, scrap, and bloom, employing 4,623 hands at wages of $2,866,021 per year, and producing goods valued at $10,730,062. In the two decades succeeding, viz, 1856 to 1876, the ratio of increase in the business of iron manufacture at Pittsburgh is about 115 per cent. as compared with 1836, the rolling mill, foundry, nail, spike, ax, saw, and shovel produce in 1876 being $33,250,000 against $14,202,000 in 1856.

An important corollary of the iron business at Pittsburgh is the investments in blast furnaces for providing the material required in technical manufactures.

The first furnace of this class was erected in Pittsburgh in 1792, and was only in operation about two years. The second one was built in 1859. Between the dates mentioned all the pig-iron for rolling mills and foundry purposes was brought from other points.

At present there are in the city the following blast-furnaces:

Built.	Names.	Owned by—	Height.	Bosh.	Capacity.
					Net tons.
1859	Clinton	Graff, Bennett & Co	45	12	15,000
1861	Eliza No. 1	Laughlins & Co	60	17	60,000
1861	Eliza No. 2	do	60	14	
1882	Edith	National Tube Company	70	16	35,000
1865	Shoenberger No. 1	Shoenberger, Blair & Co	62	13½	48,000
1865	Shoenberger No. 2	do	62	13½	
1872	Isabella No. 1	Isabella Furnace Company	75	18	130,000
1872	Isabella No. 2	do	75	20	
1872	Soho	Moorhead, McCleane & Co	65	19	40,000
1872	Lucy No. 1	Carnegie, Phipps & Co	87	20	130,000
1877	Lucy No. 2	do	87	20	
1879	A	Carnegie Brothers & Co	65	13	25,000
1879	B	do	80	20	55,000
1879	C	do	80	20	55,000
1881	D*	do	85	20	57,500
1881	E†	do	85	20	57,500
1883	Carrie	Pittsburgh Furnace Company	70	18	40,000
1886	F	Carnegie Brothers & Co	85	20	57,500
1886	Eliza No. 3	Laughlins & Co	60	17	30,000

* Largest daily output, 298 gross tons. † Largest daily output, 303 gross tons.

To this statement should be added other furnaces in the vicinage, which are virtually a portion of the blast-furnace industry of Pittsburgh, amounting to an annual capacity of 97,000 tons, thus making the total output of pig-iron, annually, equal to 922,000 tons, or an amount equal to one-eighth of the entire product of the United States.

The following is a detailed statement of the rolling-mill industry of Pittsburgh:

Style of works.	Style of firm.	Established.	Puddling furnaces.	Heating furnaces.	Trains rolls.	Nail and spike machines.	Capacity.
							Tons.
Sligo	Phillips, Nimick & Co	1825	34	10	5	.....	16,000

NATURAL GAS.

The novel fuel supplied by natural gas claims the very first consideration in any detail of the industries of Pittsburgh, from the vital relation it already has established with economical manufactures of all kinds. The faith of capital in the permanence of the supply of this ideally perfect fuel is shown in the fact that over $4,000,000 have been expended in pipe lines for its conveyance to Pittsburgh and the minor manufacturing centers of the neighborhood. These pipe lines now aggregate a length of 500 miles, including the service-pipe to individual points of consumption. The change of fuel from coal to gas is so general that the results of the use of the new calorific will before long be accurately guaged.

Economy, however, it has been found, is not even the leading element to be considered, great as the actual saving is over all other kinds of fuel. In most processes of manufacturing carried on in Pittsburgh, the use of natural gas has brought with it either greater facility for carrying on work, or a decided improvement in the product, or an increased quantity of the same. Every branch of work, for some one or more of these reasons, has, in addition to the saving of the cost of fuel, been anxious to introduce the subtle agent. Besides, it has superb attractions as a domestic fuel, bringing cleanliness and comfort and perfect power of regulation into household economies.

The 300 miles of gas-mains in operation deliver to the manufacturing establishments of Pittsburgh and vicinity, and to private dwellings, etc., a heating power about equal to that supplied by the consumption of 2,000,000 bushels of coal per month, or almost 1,000,000 tons per annum. This is equal to more than one-third of all the local consumption of coal in 1884.

The following is a list of the natural gas companies having established pipe lines to Pittsburgh and Allegheny:

The Penn Fuel and Fuel Gas Consolidated Companies' lines, from Murraysville to Pittsburgh: Three lines of 5⅝ inches diameter; one line of 8 inches diameter; one line of 10 inches diameter.

Philadelphia Company lines: One line of 10 inches diameter from Tarentum to Pittsburgh and Allegheny; two lines of 8 inches diameter from Murraysville to Pittsburgh and Allegheny.

Ford and Nelson lines: One line of 5⅝ inches diameter, from McGuighan Wells, Washington County, to Pittsburgh; one line of 8 inches diameter from McGuighan Wells to Pittsburgh.

Chambers line: One line of 10 inches diameter from Washington County to Pittsburgh.

Carpenter line: One line of 8 inches diameter from Murraysville to McKeesport and Pittsburgh.

Acme Gas Company line: One line of 8 inches diameter from Murraysville to Braddock and Homestead.

National Tube Works line: One line of 8 inches diameter from Murraysville to McKeesport.

Spang, Chalfant & Co.'s line: One line of 6 inches diameter from Butler County to Sharpsburg.

The Hite Line: One line of 8 inches diameter from Tarentum to Hulton and Allegheny.

Quite a number of new companies are being formed under the new statute adopted May 25, 1885, permitting natural gas companies to incorporate.

Some thirty towns are already supplied with the new fuel, the average rates for domestic purposes being as follows:

Cook-stove, per annum	$26.66
Cook-stove and one heating-stove	40.00
Cook-stove and five heating-stoves	66.66

It is expected that in the cities of Allegheny and Pittsburgh low-pressure gas will be furnished at not more than 6 or 7 cents per thousand cubic feet, although up to this time rates have been purely experimental.

The gas-mains enumerated above form a total length of more than 300 miles, the distributing-pipes, laid 3 or 4 feet under the grade of streets, etc., and the branch pipes to special points of consumption, being at least 200 miles in additional length. To this aggregate should be added about 200 miles more of piping laid by new companies; making a grand total of 600 miles of iron piping used for this single purpose.

The difficulties formerly encountered in laying pipes, and in either preventing leakage or providing that such escape shall be harmless, have been successfully met and overcome by a number of ingenious devices, which it would be foreign to this report to specify here. These difficulties, however, continue to be such as make it quite certain that this means of conveyance of natural gas must be limited to a distance not much greater than has already been covered by the longest pipe lines. The friction of the gas-fluid reduces the pressure at the rate of about 7 pounds to the mile; in other words, an original pressure of even 200 pounds at the well will be reduced to nothing in a pipe distance of 30 miles, and the delivery of gas at the remote end of the line will, of course, be in the same ratio. This pneumatic law is often lost sight of by those who suggest the possibility of conveying natural gas to the seaboard cities.

The natural conclusions deducible from all the circumstances are:

(1) There is an abundance of natural gas in Western Pennsylvania, whose exhaustion can not now or at any remote period be counted upon.

(2) That this fuel, to be utilized to the best advantage, must be consumed within a radius of 30 to 40 miles from the supplying wells.

(3) That it is not advisable to plant any manufacturing establishment in a position where it must depend upon a single well, but that safe reliance can only be placed on supplies drawn from a pipe or system of pipes; and,

(4) That by the use of natural gas as a fuel a saving of from 33 to 50 per cent. may be effected as compared with the cost of coal fuel in other manufacturing centers of the United States.

From these facts it is easy to understand what a commanding influence the new system of fuel and heating must reach in the near future.

Manufactories of all sorts will be drawn to Pittsburgh and the towns in the natural-gas territory, especially those in which the cost of fuel is at all considerable. The abundance of skilled labor, healthful climate, cheapness of transportation, both by river and rail are re-enforced by natural gas, so as to leave nothing to be desired for mechanical industries.

The effect of the new fuel for furnace purposes, in enhancing the excellence and consequent intrinsic value of manufactured products, has received some attention in that part of this report relating to the glass-making industry of Pittsburgh, in which the superiority of this over every other form of fuel for smelting is most plainly apparent. What is said there has relatively the same application to the manufacture of steel, pottery, and the like; and it would seem that American manufactures are to be thus enabled to enter upon an era of enlargement and improvement unexampled in the industrial history of the world.

Reference has likewise been made in that portion of the report given to the coal trade of Pittsburgh to the probable effect of natural-gas development upon the consumption

of coal for manufacturing purposes, and a suggestion is there offered that the present inferior fuel may yet furnish the manufacturing world with fuel gas in case the wells should eventually fail.

PRODUCTION OF IRON AND STEEL.

The following table gives the production of iron and steel in Pittsburgh and the remainder of Allegheny County, Pa., from 1874 to 1884, inclusive, in net tons:

Years.	No. rolling mills.	Product of iron rails, bar, angles, bolt, rod, and hoop.	Product of sheet and plate, except nail plates.	Product of nails.	Total rolled iron, including nails.
		Tons.	*Tons.*	*Kegs of 100 pounds.*	*Net tons*
1874	31	194,114	52,361	562,995	274,625
1875	31	171,178	45,773	442,359	239,069
1876	31	189,511	31,488	538,874	247,943
1877	31	208,342	30,254	597,806	268,486
1878	31	226,687	33,445	444,013	282,333
1879	32	286,882	52,265	294,942	353,894
1880	30	287,253	80,899	419,098	389,107
1881	30	405,119	75,767	485,916	505,182
1882	31	336,628	71,038	459,228	430,627
1883	32	367,106	73,850	627,896	472,351
1884	35	401,372	96,170	*45,326	*1,524

*Reduced by strikes.

The average annual output of these mills during the past five years will aggregate 550,000 tons, including 25,000 tons of nails per year. Over 18,000 hands are employed, at average annual wages of $11,500,000, and the approximate value of the annual output is about $35,000,000. The classes of goods manufactured are merchant bar, hoop, band, boiler-plate, tank, sheet and patent planished iron, wrought-iron pipe and boiler tubes, railroad spikes, nails and tacks, horseshoes, galvanized sheet-iron and light plates, skelp-iron, axles, railroad specialties, bridge rods, angles, and shapes. Cold-rolled polished shafting is also a special product of the American Works, and is made nowhere else in the world. In addition to these products, a single mill turns out an average of 30,000 tons of finished wire, and about 15,000 tons of steel wire is manufactured into barbed wire annually by the same concern.

THE PITTSBURGH METAL MARKET.

The enormous consumption of raw materials by these rolling-mills and kindred establishments renders Pittsburgh one of the most important centers of trade in crude metals on the American continent. Ores from nearly every quarter of the globe, in fact, are brought here. Iron mined in England, Scotland, Sweden, Norway, Spain, Greece, and Africa are present and quotable. Michigan, Missouri, Tennessee, Kentucky, Wisconsin, Ohio, New York, Alabama, West Virginia, and the Canadas contribute their metals in large quantities. Estimates made by factors of foreign ores show that about 200,000 tons of manganiferous ore from the mines of England and Spain are annually imported to feed Pittsburgh furnaces, and about 20,000 tons from Greece; England and Spain contribute 10,000 tons of pig-iron, and 2,500 tons of Swedish pig come to the puddling and rolling mills of the city every year. Sweden further sends 4,000 tons of bar-iron for conversion into steel and 40,000 tons of spiegeleisen and 15,000 tons of steel-rail croppings.

According to a report made by Secretary Follansbee, of the Pittsburgh Chamber of Commerce, to this Bureau in 1882, the gross receipts at Pittsburgh of ore, pig-iron, blooms, billets, old rail and scrap-iron, for the decade between 1870 and 1880, were as follows:

Year.	Ore.	Totals.	Year.	Ore.	Totals.
	Tons.	*Tons.*		*Tons.*	*Tons.*
1870	44,900	319,720	1876	208,262	479,798
1871	75,820	367,207	1877	230,476	552,037
1872	115,420	496,648	1878	299,856	676,728
1873	320,844	533,918	1879	356,093	782,516
1874	255,317	631,182	1880	346,733	834,582
1875	175,596	410,604			

For the seven years last past the receipts of raw irons and crude ores of iron will average annually 800,000 tons.

This enormous weight of the metal handled is by no means all. The output of pig-iron by the furnaces at Pittsburgh must be added. Between 1874 and 1885, inclusive, this product, according to statistics of the American Iron and Steel Association, has been as follows:

Year.	Tons.	Year.	Tons.	Year.	Tons.
1874	143,660	1878	217,299	1882	358,840
1875	131,856	1879	267,315	1883	592.475
1876	128,555	1880	300,497	1884	487,055
1877	141,749	1881	385,453	1885	585,696

There must still be added the raw ore, scrap, old rails, and pig received by river and the old rails and scraps of the immediate neighborhood, which brings the grand total up to quite 2,000,000 tons annually, representing a commercial value of $30,000,000.

Beside the irons, the metal market at Pittsburgh finds a sale and use for large amounts of copper, tin, lead, spelter, antimony, manganese, and other metallic ores, not excluding silver and gold, so that the above amount is appreciated by nearly $12,000,000 in annual value.

To transact this trade in metals there are eighteen firms engaged, having an aggregate invested capital of $1,125,000.

THE FOUNDRIES OF PITTSBURGH.

These establishments follow in logical order of rank among the iron industries of the city, and, for statistical purposes, include the engine and machine works of the city, as many of the latter have foundries in connection with their regular departments. The products of Pittsburgh foundries in staple castings include heavy mill gearing, railroad castings, rolling-mill castings, cannon, plows, chilled wheels, shafts, drills, punches, and planers for iron works, hollow ware, stoves, grates, steam-engine work, and the whole long catalogue of domestic hardware.

The business has grown of late years to such enormous proportions as to require classification in any adequate statistical subdivision, and the various departments of foundry work will appear from the following table, showing the various firms engaged in the business:

Style of works.	Established.	Cupola.	Air furnaces.	Capacity.	Specialties.
				Tons.	
Washington	1836	2	1	12,000	Rolling-mill machinery, marine and stationary and heavy machinery.
Fulton	1855	3	2	12,000	Grooved chilled rolls, rolling-mill machinery.
Fort Pitt	1830	3	1	6,000	Rolling-mill, blast-furnace, steel-works machinery.
Atlas	1886	2	1	10,000	Steel-works, rolling-mill, and heavy machinery.
Scaife	1848	1	1,616	4,000	Rolling-mill machinery, steel and flour mills.
Pittsburgh	1803	2	3	15,000	Chilled rolls and heavy castings.
Lewis	1863	1	1	1,800	Rolls and heavy machinery.
Phœnix	1861	1	3	12,000	Semi-steel and chilled rolls.
Berlin	1808	1	.....	3,600	Miscellaneous castings.
Rosedale	1866	2	.....	4,000	General castings.
Hecla	1861	3	.....	4,000	Do.
Iron City	1863	.....	2	7,500	Heavy architectural castings.
Lawrence	.....	1	.....	3,000	General castings.
Pittsburgh Smelting Company	1878	1	.....	3,000	Do.
Jarvis Adams	1870	2	.....	6,000	Light castings.
Campbell Manufacturing Company.	1881	1	.....	3,000	General castings.
Twenty-ninth Street	.....	2	.....	5,000	Do.
Bissell & Co	1827	1	.....	2,500	Stoves, ranges, and grate fronts.
Mitchell	1829	1	.....	4,500	Stoves and ranges.
Etna	1836	1	.....	4,500	Do.
La Fayette	1844	1	.....	1,800	Stoves.
Keystone	1850	1	.....	3,600	Stoves, grate fronts, ranges, and heaters.

Style of works.	Established.	Cupola.	Air furnaces.	Capacity.	Specialties.
				Tons.	
Graff & Co	1844	1	.....	3,600	Stoves, grate fronts, ranges, and heaters.
Crea, Graham & Co	1877	1	.....	2,400	Do.
Reed Foundry Company	1883	1	.....	1,100	Do.
McConway & Forley	1868	1	4	3,000	Malleable iron castings.
Artizan	1870	1	.....	900	Railroad supplies and small castings.
Robert Lea	1854	1	.....	4,500	Foundry.
Duquesne	1854	2	.....	10,000	Do.
W. Fisher	1857	2	.....	.....	Brick machinery.
Fischer Foundry and Machine Company.	1863	2	.....	4,000	Foundry.
Anderson's	1869	2	.....	5,000	Do.
Fourth Ward	1836	2	.....	5,000	Heavy castings.
Anchor	1877	2	.....	12,000	Do.
Velte	1876	2	.....	3,000	Do.

These establishments have a cupola capacity of 190,000 tons of metal, employ an average of 3,500 hands, using an average of 125,000 tons of pig-iron annually, and the value of their product nearly $7,000,000.

Next come the manufacturers of building hardware, consuming annually 40 tons of copper, 40 tons of iron wire, 1,200 to 1,500 tons of pig-iron, and about a million mineral knobs, the value of their products being $500,000. The firms building the Westinghouse air-brake and Westinghouse engines employ nearly 1,000 hands. The locomotive manufacturers turn out annually 150 engines of standard and 120 of narrow gauge. The company making a specialty of constructing blast furnaces and steel works has been doing a net business of $1,000,000 annually for six years past, employing 400 hands at annual wages of $350,000.

Iron bridge building is another important cognate industry, and employs 750 hands, at annual wages of $460,000, turning out 21,000 tons of finished work, valued at $20,300,000. The Saint Louis bridge, the largest steel-arch structure in the world; the bridge across the Ohio at Henderson, Ky.; the materials of the Sand Island cantilever bridge at Louisville, Ky., and a hundred other magnificent and costly structures in this as well as in countries of the South American continent testify to the skill and enterprise of Pittsburgh bridge builders.

For the manufacture of bolts and nuts, largely used in bridge construction, there are seven establishments, employing about 600 hands, at annual wages of $325,000, and having an invested capital of nearly $500,000, with an annual output of between $1,250,000 and $1,500,000.

In the production of chilled and sand rolls, exclusively, the Phœnix Roll Works, established in 1861, produce annually over 3,000 tons of finished goods, and employ 60 hands, to whom are paid about $50,000 in annual wages.

Fourteen firms are engaged in the manufacture of tanks and boilers, and their product comprises boilers, tanks, bridge works, hulls, oil stills, furnaces, etc. The plants are valued at $600,000, and employ about 1,000 hands, requiring $500,000 in annual wages and producing an annual output of $2,000,000.

Eight firms of steam-fitting machinists and valve manufacturers turn out $750,000 worth of work every year, employing 350 hands and paying out $200,000 as annual wages. There are $200,000 invested in this branch of the iron business. To these should be added some twenty smaller establishments engaged in making natural-gas fittings, with an annual business reaching $250,000 more.

In the manufacture of saddlery hardware $140,000 working capital is employed, producing goods of the annual value of $150,000, giving work to 125 hands, whose wages average $50,000 annually.

The manufacture of steam-pumps employs 80 hands in two establishments, who turn out a product valued at $175,000 per year.

Fire-proof safes are made by a single firm, employing an average of 120 workmen, at $45,000 annual wages, and the finished product averages $200,000 annually. In the plant $70,000 is invested, and $80,000 worth of material is consumed annually.

Iron tubing for boilers and wrought-iron pipe engage five firms, having a capacity of about 150,000 tons annually, with an invested capital of $3,000,000. Two thousand hands are employed in this department, distributing annually about $1,100,000 in wages. The output of these mills is from $8,000,000 to $9,000,000 per year. Iron tubing from one-eighth inch to 16 inches in diameter is made at all the mills of this class, of such fine quality and so cheaply that the manufacturers can successfully meet the sharp competition of European plants; large shipments having been made to Russia of late years, and also to Canada, in which latter territory Pittsburgh makers are not only able to pay

the import duties, but to decidedly undersell the English firms. Fully two-thirds of all the iron and steel tubing made in the Middle States is the product of the Allegheny County tube-works.

Three establishments carry on the manufacture of iron chains, employing an aggregate of 100 hands, having an invested capital of $100,000, a capacity of 2,000 tons of finished product per year, valued at $120,000.

In enameled-iron goods, the single firm engaged employs 135 hands, at annual wages of $60,000; using 1,200 tons of metal, and turning out $200,000 worth of hollow ware, plumbers' sanitary goods, etc., upon an invested capital of $150,000.

In wrought hardware another factory has $40,000 invested in a working plant, employing 125 hands, at $40,000 annual wages, and consuming 1,000 tons of iron in producing goods valued at $125,000.

In the manufacture of architectural iron work 250 hands are employed by the single firm of W. B. Scaife & Sons, to whom $80,000 in wages are paid annually. This concern consumes not less than 1,800 tons of iron annually, and has $250,000 invested in ground, buildings, and machinery alone. Nearly half a million dollars in value of finished goods comprises the annual product.

STEEL PRODUCTION.

Nothing has more contributed to the fame of Pittsburgh than her excellent steel products. From 1833 the business has steadily grown in importance, and between that date and 1860–'61 several qualities of steel were successfully manufactured here. At the latter date a fine grade of cast-steel from crucibles for edge tools was made and put into market as a successful competitor with English makers. To-day Pittsburgh steels are standards for the American markets, and have, to a large degree, supplanted English ingots and bars in the edge-tool factories of the United States. The introduction of natural gas as fuel has immeasurably increased the facilities of Pittsburgh metal workers, and will, no doubt, enable greater perfection to be attained in steel products.

List of the steel works of Pittsburgh, showing their capacity, etc.

Style of works.	Established.	Sieman furnaces.		Gross tons Sieman open-hearth furnaces.	Open-hearth furnaces.	Converting furnaces—tons.	Puddling furnaces.	Heating furnaces.	Trains of rolls.	Steam hammers.	Pots at each heat.	Annual capacity—Net tons.

[1] Fine tool crucible steel. Information refused. Specialties, drill rods, needle wire, fine watch-spring wire, and steel.
[2] Manufacture only springs and axles for carriages and wagons.
[3] See rolling-mills.
[4] 4 48-pot steel-melting furnaces.
[5] Established to make fine crucible steel.
[6] Just completed.
[7] Product used by firm for shovels.
[8] 4 5-pot steel smelting furnaces.
[9] See founderies, steel casting.
[10] Clapp-Griffith process steel.
[11] See steel nails, etc.
[12] Sheet steel.

From the reports of the American Iron and Steel Association it appears that the output of these works in shape of crucible-steel ingots for the years named was as follows:

Year.	Tons.	Year.	Tons.	Year.	Tons.
1874	17,915	1878	27,866	1882	59,596
1875	22,942	1879	40,142	1883	59,128
1876	25,009	1880	52,136	1884	38,885
1877	24,747	1881	61,256	1885	42,139

In the steel mills proper there are employed an average of 4,500 hands, whose wages aggregate something near $4,000,000 per year, and the value of the plants is placed by competent authority at between six and seven millions. Precise figures as to value of output, other than those given above, could not be obtained locally, although strenuous efforts were made to accomplish the desired end. It will be proper here to add that at numerous points along the river the same reluctance was encountered from certain classes of business in gathering and completing tables of special statistics, which no explanation or persuasion was able to overcome. The desirability of an authoritative rule and method of securing the aggregated commercial statistics of the country is forcibly presented to the mind of every agent of the General Government who is called on to engage in special work of this kind.

BESSEMER STEEL.

This product, a low grade of steel, especially adapted by its superior tensile strength to rails and bridges, is manufactured at Pittsburgh by the following firms:

Name.	Converters.	Established.
Edgar Thomson Steel Works	3 10-gross ton converters	1875
Carnegie, Phipps & Co	2 5-gross ton converters	1881
Pittsburgh Steel Casting Company	1 5-gross ton converter	1881
Oliver Brothers & Phillips	2 2-gross ton converters	1884
Jones & Laughlins	2 7-gross ton converters	1886
Shoenberger & Co	1 7-gross ton converter	.....

In a report of the American Iron and Steel Association, the make at Pittsburgh of all other steel than crucible, including Bessemer ingots, is as follows:

Year.	Tons.	Year.	Tons.	Year.	Tons.
1874	6,000	1878	106,948	1882	258,500
1875	15,498	1879	130,781	1883	346,402
1876	54,467	1880	169,819	1884	298,376
1877	82,401	1881	247,345	1885	364,405

The probable annual value of the steel output from Pittsburgh and Allegheny County producing works is certainly not less than $20,000,000; more than this, in the circumstances, it would not be prudent to say.

In the manufacture of elliptic and spiral springs, carriage and wagon springs and axles, agricultural steels, plows, hay-forks, and other specialties in steel tools, the trade of Pittsburgh has $3,455,000 capital employed, with 2,758 hands, producing 114,200 tons of finished goods at wages averaging $1,567,000 annually.

THE GLASS TRADE.

To the results of ninety years practical experience in glass-making Pittsburgh manufacturers have added the great advantage of gas fuel, and the prophecy is made that she is destined to become the controller of the glass trade of the world.

The business began here in 1795 with a window-glass factory of eight pots, making three boxes at a blowing and using wood for fuel. In 1804 Cramer's Almanack, a Pittsburgh publication, gives the annual product of glass at $12,500. In 1817 three window-

glass factories made goods valued at $130,000. In 1825 the value of this product had increased to $135,000. In 1831 there were four window and four flint glass houses producing to the value of $500,000. Six years later there were seven window-glass and bottle factories, employing 220 hands and producing goods to the value of $210,000. In 1856 nine firms were making window and green glass, having 22 factories or furnaces, whose product was 28,080,000 feet of window-glass valued at $1,123,200, bottles and druggists' ware valued at $329,250, and 80,000 demijohns valued at $32,000. In 1875 the same class of works produced goods amounting to $3,750,000. As an evidence of the vastly superior quality of the window-glass factories under the régime of natural-gas fuel over that made by using coal, it is stated, as a recent experiment, "thrice the quantity of sheets of gas-fuel glass was placed together and the ordinary printed matter of a newspaper could be easily read through them. As to polish, the 'coal glass' had a dull surface, while that made and flattened by gas presented the brilliancy of French plate."

At the present time there are 15 firms making window-glass in Pittsburgh, the earliest being established in 1797, and the latest in 1880. These employ 1,675 hands, at annual wages of $1,350,000, producing 900,000 boxes of 50 feet each, valued at $1,800,000, and requiring an investment of over $2,000,000 in plants.

In flint-glass, or, as it is termed by the trade, "tableware," the first factory, established in 1807, has been multiplied into 14 firms; the last one being organized in 1880. These require 3,000 hands, at average annual wages of $1,275,000, have $1,580,000 invested in plants, and turn out 23,000 tons of tableware, valued at $3,000,000. Much of this product rivals the finest Venitian and Bohemian and Japanese wares, now so much in vogue.

In the manufacture of lamp chimneys, glass and enameled lamp shades, druggists' glassware, green glass, lamps, stained glass, glass molds, etc., there are 29 establishments, with an invested capital of $1,905,000, employing 3,385 hands, at annual wages of $1,530,000, and producing goods annually valued at $2,925,000.

MECHANICAL AND INDUSTRIAL ENTERPRISES.

In that considerable group of miscellaneous manufactures to be found in Pittsburgh, the report of the Chamber of Commerce for 1884, the last published, gives the authority for the figures furnished in the table of general comparative statistics to be found below:

Statement of the mechanical and in ustrial enterprises of Pittsburgh, with their capital, labor, and products, for the years named.

Class of industries	*1880.				†1881-'82.				‡1883-'84.

*The statistics for 1880 are those of the Tenth Census, and the items marked *a*, *b*, *c*, *d*, *e*, and *f*, respectively, could not be separated to meet the classification of the local work for 1881–'82 and 1883–'84.

† Taken from the report of the Pittsburgh Chamber of Commerce for the year 1881–'82, the latest issued, except the report for the following year, containing commercial statistics in tabular form.

‡ Taken from "The Mercantile, Manufacturing, and Mining Interests of Pittsburgh," issued by the Chamber of Commerce of that city.

THE COAL TRADE.

A writer upon the subject estimates that the bituminous coal field by which Pittsburgh is closely surrounded and from which her gigantic coal traffic is derived is equal to 15,000 square miles, and its money value at 5 cents per bushel is nearly $75,000,000,000, and that $75,000,000 worth could be realized from sales of this coal annually for a thousand years, and then only exhaust the upper seam of the measures.

In 1817 the transportation of coal in flat-boats down the Ohio River from Pittsburgh was begun from French Creek, where the mines were then located. These boats were loaded with from 4,000 to 6,000 bushels, lashed in pairs with ropes, and floated as far down as Cincinnati under charge of a crew of five men.

With the increase of trade and the development of the coal lands along the Monongahela River this method of floating the product to an equally growing market became too slow and inadequate, and the application of steam for towing purposes was made. The history of this enterprise has been admirably told by Colonel Thurston, one of the best informed citizens of Pittsburgh on all important commercial events in which the city has been concerned during her wonderful career. He says:

"The writer recollects well how the proposition to tow the unwieldy 'French Creeks' was received by the coal boatmen and was ridiculed. The term 'crank' had not then been coined, but those who talked of towing coal as a feasible thing were at that day spoken of as such under a more common name, and conservative business men shook their heads wisely and smiled dubiously. As the coal boats had to be floated to market on flood waters, it did, to those acquainted with the rapid currents of the Ohio in the spring and fall rises and the June freshets, seem a dangerous business to attempt to tow those huge unwieldy bulks of coal in flat-bottomed, box-shaped boats through the crooked channel and sharp bends of the river. But in 1845 Daniel Bushnell began towing coal down the Ohio with a small stern-wheel boat called the *Walter Forward*, making a trip to Cincinnati as an experiment with three coal-flats loaded with 2,000 bushels each. In the same year Judge Thomas H. Baird began towing coal to Hanging Rock, Ohio, with a side-wheel boat called the *Harlem* and two 'Model' barges, bringing back pig metal. In the fall of 1849 Hugh Smith began to tow coal to the lower markets with the steam tow-boat *Lake Erie*. During 1849 Daniel Bushnell built the *Black Diamond* tow-boat to tow coal to Cincinnati and to New Orleans in 1850, from which date towing coal, as it was called, superseded altogether the floating system.

"The term 'towing' is a misnomer, as the boats and barges containing the coal are propelled instead of towed. Although this is an old song to Pittsburghers and many along the river, yet to others it may not be uninteresting to be told that a tow, as it is called, is made up of one tow-boat and from ten to fourteen barges, coal boats, and flats, and from one to four fuel boats filled with slack coal for boiler fuel during the trip. These boats are all placed in front of the tow-boat, except one on each side of the steamer, all securely lashed together, forming a compact mass about 350 feet long and 150 feet wide, and holding from 500,000 to 700,000 bushels, or about an average of 24,000 tons, being the yield of from 5 to 7 acres of coal land, according to the size of the tow, so called. Of such tows from eight to ten in a day in the coal-boating stages of the Ohio leave the harbor of Pittsburgh for all points below as far as New Orleans, and there are now from ninety to one hundred towboats, varying in cost from $8,000 to $30,000, employed in thus propelling coal, being the outgrowth in forty years from the little *Walter Forward* with her three flat-boats, holding 6,000 bushels, or about 240 tons, of coal.

"As explanatory to those who are not familiar with the terms of 'barge,' 'coal boat,' and 'flat,' being the 'packages,' as the trade term is, in which the coal is carried, a word or two of description of these 'packages' may be of interest. Coal boats are built 170 feet long by 26 feet wide, of 1½-inch plank, with about 18 inches rake at each end. They carry 24,000 bushels and draw 7 feet when loaded. They are only used to convey the coal to its point of destination, and go with the coal in the sale. They cost about $600 each. A barge is 130 feet long by 25 feet wide, constructed somewhat similar to the hull of a steam-boat, but with stern and prow alike, having bottom planking of 3-inch thickness and gunwales 6 inches. The loading capacity of barges is about 13,000 bushels, and they draw 6 feet water when loaded. They cost from $1,000 to $1,100, and last from nine to ten years, being *towed* back from the point where the coal is sold, going by the technical term of 'empties' on the return trip. Fuel boats are similar to barges, only smaller, being 95 by 20 feet, and draw 4 feet water loaded. They cost $600, and will last ten years in service, and carry 7,000 bushels. Flats are 90 by 16 feet, built same as barges, carry 4,000 bushels, and draw loaded 4¼ feet water, costing about $400.

"A tow of coal made up of these various descriptions of boats to the number, as before stated, of eighteen barges, coal boats, and flats, with the tow boat, and loaded with the average of 600,000 bushels, or 24,000 tons coal, represents a value of $80,000 as it leaves the harbor at Pittsburgh. As before stated, eight or ten of such massive islands, as it were, of coal, equal in surface to 1¼ acres, and floating the coal product of from 6 to 7 acres

of coal land, depart in the boating stages of the Ohio from Pittsburgh. The 'driving,' for such it almost seems to be, in its handling by the deft pilot, who with sinewy arms whirls and rewhirls the wheel that guides the boat and this mass of coal, is a task to which only those brought up to the trade are competent. Skill, judgment, nerve are all called into play as this ponderous bulk, borne along on a river at flood height, running at a current of 8 to 10 miles an hour, sweeps onward. Through narrow channels, round sharp bends, between the stone piers of bridges, where a miss turn of the wheel, a failure of judgment, a miscalculation of distance means disaster and wreck, the pilot guides the tow, now backing, now flanking, now pushing, now floating, watchful and cool the pilot does his work. There is probably no such boatsmanship shown anywhere else in the world as is displayed by the Pittsburgh coal tow-boat pilot. Watching one of these ponderous tows surging down the river with the little tow-boat of perhaps 90 to 100 feet in length and 20 to 25 feet in width at its rear, turning it round bends, flanking it past points, backing and checking it in narrow channels, one can not but think of the old joke of the tail wagging the dog, and here it does it, and does it well. It is a wonderful exhibit of skillful navigation, the thus handling by the nervy grip of one man on a wheel a bulk of 30,000 tons, moving at a speed of from 12 to 15 miles an hour down such a tortuous stream as the Ohio, and with perhaps not 5 feet to spare of channel width or 2 feet of water depth."

The coal thus transported down the river from Pittsburgh is almost wholly drawn from the four "pools" of the Monongahela River that are stocked by fifty-nine firms of operators, employing the services of 8,860 hands, at annual wages averaging $3,177,000, and producing an output averaging 98,580,000 bushels per year.

These figures are not precise, of course, being subject to the very important disturbing elements of "strikes," unremunerative markets, and difficulties in running coal caused by low stages of water in the river; but the amounts stated form a fair average for the operations of a good season when the mines are productive up to their ordinary capacity.

The amounts passing the locks of the Monongahela Navigation Company represent the totals taken out of that stream and actually consumed in Pittsburgh and shipped to markets along the Ohio River and below. The following are statistics from the records of the company named:

Statement, in bushels, of coal and slack shipped from the several pools of the Monongahela slack-water annually for the years named.

Year.	Bushels.	Year.	Bushels.	Year.	Bushels.
1844	737,150	1859	28,286,671	1874	67,821,200
1845	4,605,185	1860	37,947,732	1875	63,707,500
1846	7,778,911	1861	20,865,722	1876	68,481,000
1847	9,645,127	1862	18,583,956	1877	79,480,918
1848	9,819,361	1863	26,444,252	1878	76,825,255
1849	9,708,507	1864	35,070,917	1879	65,588,000
1850	12,297,967	1865	39,522,792	1880	84,048,350
1851	12,521,228	1866	42,615,300	1881	86,254,660
1852	14,630,841	1867	30,072,700	1882	101,434,700
1853	15,716,367	1868	45,301,000	1883	108,487,800
1854	17,331,946	1869	52,512,600	1884	79,269,100
1855	22,234,009	1870	57,596,400	1885	82,459,050
1856	8,584,095	1871	48,621,300	1886	109,895,147
1857	28,973,596	1872	54,208,800		
1858	25,696,669	1873	58,276,995	Total	1,869,960,776

In addition to the coal produced along the Monongahela and handled by water, the collieries along the railways diverging from Pittsburgh produce nearly 150,000,000 bushels in every ordinary year, of which 60 per cent. is probably consumed by Pittsburgh, and the remainder is shipped by rail directly from the mines to interior Western markets. There are no official statistics of the consumption of coal in Pittsburgh, so that it is impossible to state with precision what proportion of the total outputs of the mines goes to other markets.

Concerning the effect of introducing natural gas as a manufacturing fuel, Colonel Thurston, above quoted as an intelligent writer, while on the subject of coal in connection with Pittsburgh's industrial resources, has to say:

"At first it would seem to threaten a decadence of the coal trade. But it is not unlikely it may increase the consumption of coal and thus even enhance the value of coal lands around Pittsburgh and the returns therefrom. While natural gas has almost entirely supplanted coal as a manufacturing fuel at Pittsburgh, this is possibly only a forerunner of a greater use of coal. The advantage in thus using gas is so great that even were the supply of natural gas to fail, the commercial manufacturing world would still

require gas fuel from coal and preclude the return to crude coal heat. Ignoring the question of cheapness of gas over coal where the consumption is made at or in the near adjacencies to the well, the other advantages of gas fuel already established would enforce its use under a similarity of cost. The use of gas, whether of nature's production or from artificial supply, being primary, its obtainment from such material as will produce it most satisfactory in all respects follows. Of all substances bituminous coal, and of all coals that of the Pittsburgh seam, is pre-eminent. If artificial gas is to be had, the best quality and at the least cost is imperative. Where the gas is not in a vicinage artificial methods of conducting it there will be tried. At present the means of piping natural gas long distances are not economical, and its natural progress of flow seems limited, the appliances of artificial propulsion so far seeming to add so much to its cost as to overcome its desirability over coal fuel.

"The transportation of coal and its cost are fixed commercial facts. Where manufacturing facilities exist coal can easily be laid down in proximity to the fires to be fed. The coal of the Pittsburgh seam can therefore be made easily available at whatever point manufacturing fuel is demanded, and the great storage of the gas therein, cheaply transported, unlocked and used, while the coal fuel in form of coke, of a value quite equal to the coal, remains for other fuel uses, not to take into account other products which result from the distillation of coal for the production of gas. Of these latter there are a number; and skillful chemical handling and economical management would evolve other marketable residuums. It is, therefore, very probable that while the use of natural gas may decrease the consumption of coal at Pittsburgh, it will increase it at other localities, and the coal seams of Pittsburgh be more than ever valuable. For the carriage of coal, water highways are the cheapest, and the unsurpassed system of rivers by which the coal trade of Pittsburgh reaches the West and South is unrivaled, even enabling, when tonnage is wanted in interiors where the rivers do not reach, long distances of railway transportation to be cut off, and such carriage reduced to short hauls."

THE COKE TRADE.

The coke business of Pittsburgh depends for its supplies upon the Connellsville region, as only a small amount of this article is produced in the city itself. All the great coke companies have their principal offices here, however, and their financial transactions make no unimportant part of the daily clearing-house returns. The Connellsville coke has made Pittsburgh manufactures what they are, and the product is in demand all over the United States where metal working or smelting is engaged in.

The first market consignment of this coke to a distance was made in 1842, when two boat-loads, aggregating 1,600 bushels, were taken to Cincinnati. Since then the business has absorbed nearly $7,000,000 in plants alone, and the annual product taken by the general market will now average over 4,000,000 tons. Specifically the business engages 77 separate firms and corporations, representing 10,788 ovens, consuming annually in average years 180,000,000 bushels of coal, or 7,500,000 tons, and the wages disbursed amount to over $4,000,000 annually. The value of the product varies, like any other stable commodity, with the current market price, but a safe estimate of value for each year's output would be $6,000,000.

In summing up these subjects of coal and coke, and they should be mentioned together since the cokeries mine their own coal, there are, in all the divisions of the business, 204 collieries, employing 27,680 hands, at wages amounting yearly to $11,150,000; the value of improvements, exclusive of cost of coal lands, is $12,000,000, and the sales reach about $25,000,000 on the 430,000,000 bushels, or 17,200,000 tons mined annually.

Of this enormous aggregate fully 40 per cent. finds a market through the medium of the river transportation lines far more cheaply than would otherwise be possible.

THE RIVER INTERESTS.

Upon this material subject, as related to Pittsburgh trade, Superintendent Follansbee, the chief executive officer of the Pittsburgh Chamber of Commerce, says:

"Steam towing on the rivers of the United States has been very largely the means of resuscitating the river trade, threatened with almost extinction by the construction of railroads. By it Pittsburgh has sent forth hundreds of millions of tons of coal, iron, and general merchandise throughout the entire Ohio and Mississippi Valleys. Her position in commerce has thus been maintained and an economic check imposed upon the transportation charges in this vast territory of paramount influence."

As an example of what is claimed Mr. Follansbee cites the trip made in February, 1882, by the steamer *Jos. B. Williams*, that left Louisville for New Orleans with a tow of 26 coal-boats and barges, containing 600,000 bushels of coal, or 22,800 tons, a load far greater than any ever carried by the *Great Eastern* and without a parallel in the trans-

portation annals of any country. The charges for carriage of this immense tonnage from Pittsburgh to New Orleans, a distance of 2,000 miles, were at the rate of 4 cents per bushel, or one-twentieth of 1 cent. per ton per mile, a freight rate that, as the writer remarks, "would bankrupt any railroad in the United States."

In 1881 the boating interests of Pittsburgh were represented as follows:

	Tons.
163 steam passenger and tow boats	36,845
45 model barges	16,243
1,500 coal-barges 500 coal-boats 1,000 coal-flats	1,306,884
3,208 vessels, with tonnage of	1,359,972
Capital invested	$7,447,000
Hands employed	3,260
Freight earnings during the year	$2,400,000

Since the year named, with the exception noted below, when the above statistics were gathered for a special report, no precise figures have been preserved or are now attainable, and reference is directed to the port list of boats at Pittsburgh for the year 1886 for later figures, although the Government does not include in its port registers the barges, boats, and flats used in the carrying trade. An estimate made in 1884, however, places the tonnage of Pittsburgh in this latter class at 2,000 barges, 60 model barges, 1,200 coal-boats, and 900 flats, valued at about $7,000,000. These figures will not, it is believed, vary much from the present tonnage of these transports. In this year above given (1884) the port list of Pittsburgh shows 163 steam-vessels registered, having a total tonnage of 32,914.07, making a grand total for that year of 4,323 bottoms, with a tonnage of 1,705,514.07, employing a capital of $9,740,000, 3,500 hands, and producing revenues from freights amounting to about $3,000,000.

The completion of the Davis Island Dam, at Pittsburgh, will add greatly to the harbor facilities of the city. This work has cost the United States Government nearly $1,000,000, and furnishes a pool 7 feet deep, covering an area of 1.62 square miles, sufficient for the harborage of over 12,000 steam-boats and barges. The lock length of this dam is 600 feet, with a width of 110 feet, thus making it the largest and longest lock in the world.

From the date of the construction of the *New Orleans*, in 1811 up to the present, steamboat building has been an important feature in Pittsburgh's industrial career. It is estimated that one complete steamer has been turned out from her shops and boat-yards weekly for more than a quarter of a century, beginning with the year 1842. During this period not only have a number of iron and steel steamers of light draught been built for foreign river navigation, but fully one-half of the steam fleet navigating Western waters has been constructed here. Steam-boats for general freight and passenger service are turned out at these yards requiring only a draught of 2 feet, with a tonnage capacity enabling owners to make handsome profits at half the tolls customarily charged upon railroads for like service.

For Pittsburgh alone it is estimated that the average tonnage to the account of each steamer conveying coal and coke in tows is 5,500 per half trip.

Approaching the subject of Pittsburgh's carrying trade by river and rail, any full statement of tonnage, classification, and direction of shipments for a series of years is found to be well-nigh impracticable, owing to the lack of procurable definite data. The only statement pretending to accuracy or official character is that made for the year 1881 by Superintendent Follansbee, of the Chamber of Commerce, of Pittsburgh, in a report upon the "Commerce, Industrial, and Transportation Interests of the city of Pittsburgh," published as an appendix to the Report of the Chief of the Bureau of Statistics, Treasury Department, on the internal commerce of the United States in December, 1882.

Mr. Follansbee says:

"The shipments from this city to points below, reaching as far South as New Orleans, for the year 1881, we find to be:

		Tons.
Coal and coke, 75,000,000 bushels, or		2,884,610
Shipped by Saint Louis lines:		
Steel rails	56,576	
Bar-iron, sheet-iron, splices, glassware, etc	18,827	
		75,403
By Cincinnati, Portsmouth and Louisville boats:		
Shipments composed principally of iron, steel, nails, window-glass, glassware, plows, etc		33,750

By Wheeling, Parkersburgh and Ironton boats:		
Shipments composed as above		4,700
To Tennessee River		200
Total tons		2,998,663

The receipts of freight at Pittsburgh from these points were—

By Saint Louis boats:		
Iron ore	39,740	
Pig ore	5,020	
Flour shipstuff, oil, flaxseed, etc	1,700	
		46,460
By Cincinnati and Louisville boats:		
Composed of products of the soil, pig-iron, lumber, provisions, fire-brick, etc		28,000
By Wheeling, Parkersburgh, and Ironton boats		4,500
By boat from New Orleans		500
Total tons		79,460

This does not include tonnage of tow-boats returning with empty barges, coal-boats, and flats.

For the commercial year of 1885–'86, ended June 30, the following was ascertained to be, approximately, the transactions of Pittsburgh by river, using the same classification as that of Superintendent Follansbee.

Shipments to points below, extending to New Orleans:

		Tons.
Coal and coke, 95,000,000 bushels, or		3,800,000
Shipped by Saint Louis lines:		
Steel rails	65,500	
Bar-iron, sheet-iron, splices, glassware, etc	22,000	
		87,500
By Cincinnati, Portsmouth, and Louisville boats:		
Shipments composed principally of iron, steel, nails, window-glass glassware, plows, etc		45,000
By Wheeling, Parkersburgh, and Ironton boats:		
Shipments composed as above		6,000
To Tennessee River		500
To Cumberland River		375
Total tons		3,939,375

The receipts of freight at Pittsburgh from these points, approximated—

By Saint Louis boats:		
Iron ore	47,000	
Pig-iron	9,500	
Flour, shipstuff, oil, flaxseed, etc	3,000	
		59,500
By Cincinnati and Louisville boats:		
Composed of products of the soil, pig-iron, lumber, provisions, fire-brick, etc		47,000
By Wheeling, Parkersburgh, and Ironton boats		6,225
By boat from New Orleans		1,200
Total tons		113,925

Exclusive of tonnage of empty tows returned by coal fleet.

The foregoing figures were obtained from the owners and agents of vessels, and, as stated, are to be taken as approximations of the volume of river trade at Pittsburgh for the commercial year.

As tending to show the comparative volume of steam-boating on the Upper Ohio, the following statistics of arrivals and departures of Pittsburgh boats at Cincinnati is presented from the reports of the Cincinnati Chamber of Commerce for the years named.

Years.	Number.	Years.	Number.
1877–'78	334	1882–'83	290
1878–'79	325	1883–'84	225
1879–'80	359	1884–'85	170
1880–'81	328	1885–'86	206
1881–'82	333		

The large differences apparent between these annual statistics must not be attributed to a corresponding decline of the trade by river, but consideration should be lent to the fact that river transportation is not only subject to stages of water, but also to the fact that, of late years, steam-boating has been successfully engaged on the problem of largely increasing the trip tonnage without materially enlarging expenses.

PITTSBURGH'S RAILWAY SYSTEM.

The city's main outlet by rail to Eastern markets and the Atlantic sea-board is the Pennsylvania Railroad to Philadelphia and the Northern Central Railroad to Baltimore. Northeasterly, by means of the Allegheny Valley Railroad, the great trunk lines of the lake routes are reached, and an additional route to New York secured. Southwesterly, the Pittsburgh division of the Baltimore and Ohio system gives a second route to Baltimore, and the latter city is brought 31 miles nearer to the Ohio River than by her direct lint to Wheeling with easier gradients for hauling heavy freights.

Westwardly, the Pittsburgh, Fort Wayne and Chicago Railroad to Chicago, embraces the entire net work of Ohio, Indiana, and Illinois Railways, and also reaches the trans-Mississippi lines.

By the Pittsburgh, Cincinnati and Saint Louis Railroad not only a fine additional route to Chicago and the Northwest is opened, but a route to Saint Louis, 140 miles shorter from the Atlantic cities than by way of Buffalo and Cleveland.

The same line likewise provides a second avenue of connection with the railway systems of the Middle Western States.

Northwardly, the Cleveland and Pittsburgh Railroad affords an outlet on the lakes at Cleveland, and adds a vast territory for the marketing of Pittsburgh coal and manufactured products, and facilities for the return of copper and iron ores from the Lake Superior and Canadian mines.

By the Erie and Pittsburgh line, another direct northern route, connecting with the Lake railway systems is established.

The Pittsburgh and Lake Erie road is still another line of equal value in this direction.

There are other shorter lines, more local in operation, but each contributing important parts in making Pittsburgh the great central city of American manufactures; but the scope of this report will not admit of further special treatment under this head.

EAST LIVERPOOL, OHIO.

The city of East Liverpool, Ohio, is the first river town located on the banks of the Ohio below Pittsburgh.

Its first white settler came from Pennsylvania about the year 1799, and in a few months was joined by others from the same State, giving their settlement the name of Saint Clair, after the township in which it was situated. The place was usually termed Fawcettown, out of compliment to its first inhabitant, until 1816 when streets were laid out and the village was named "Liverpool." In 1830 the place was added to the growing list of post-offices of the new West, and was finally named East Liverpool, to distinguish it from Liverpool, in Medina County, Ohio. In 1834 the town was incorporated, although in 1850, sixteen years subsequent, the population consisted of less than a thousand souls. The town's greatest progress has been accomplished during the past twenty years. In 1850 the population was 987; in 1860 it numbered 1,308; in 1870 it had increased to 2,105; in 1880 to 5,568, and now (1887) it has upon a low estimate 8,000 inhabitants.

From a work giving a historical review of the industrial enterprises of the upper Ohio Valley, issued by the International Publishing Company, the following facts are gleaned concerning this important town:

"East Liverpool is distinguished for its varied manufactures, notably of pottery. It is in the heart of a country rich in minerals and chemical deposits, since in its vicinity are valuable beds of coal, and from wells in various parts of the city natural gas is derived for illumination and fuel for hotels, public buildings, stores, residences, and manufactories.

"The transportation facilities are fully adequate. The Cleveland and Pittsburgh Railroad here furnishes connections with all the main trunk lines intersecting the country from east to west. During navigable stages of water the Ohio River furnishes means for large commercial receipts and shipments to profitable markets.

"East Liverpool is especially notable for its potteries, and is to-day the leading center of ceramic manufacture in the Union. The town started its first yellow-ware factory in 1839, clay adapted to the requirements of that class of ware having been then discovered in the vicinity. Since that date additional small potteries were started, and a fair demand was created for their comparatively rude wares. It was not until after 1862, however, that anything like solid or artistic progress was made in this direction. The year

named was made a memorable one in the history of American pottery manufactures by the passage by Congress of an import duty of 40 per cent. ad valorem upon foreign wares of this class. This policy gave an immediate impetus to the domestic trade, and manufacturers multiplied accordingly. Under this favorable condition East Liverpool soon became the principal seat in the country for pottery goods. For the thirty years prior to 1873 only yellow and Rockingham wares were produced here, but in 1873 an enterprising firm began the production of white granite goods, and the business was profitable enough to induce others to enter the same field. Since the latter date considerable attention has been given to the manufacture of cream-colored ware and to decorative pottery, until now there are eight firms busily turning out stone china from thirty-nine kilns; four firms, with a dozen kilns, making a specialty of cream-colored ware; ten firms, owning thirty-six kilns, confining their operations to the manufacture of yellow ware, and two establishments, with five kilns, turning out porcelain door-knobs. Each white-ware kiln has an annual capacity for producing goods valued at $30,000; a 'C. C.' or cream-colored ware kiln, about $25,000, and a yellow-ware kiln, $15,000 to $18,000."

The annual product of all these potteries will average $2,000,000, and has ranged half a million dollars above those figures. The capital invested is about $2,000,000, and the value of the pottery product in 1886 was nearly, if not quite, equal to the capital invested. Almost all the capital invested is owned by residents of the city. The pottery products are distributed for sale and consumption all over the United States, the principal markets being through the West, Northwest, and South.

Messrs. Knowles, Taylor & Knowles, the largest single manufacturers of granite ware in this country, at this point, are authority for the statement that during the period when water navigation is practicable these products are shipped to Michigan, Wisconsin, and Northwestern points by rail and lake, via Cleveland, and to all Ohio River points by that river. Other markets are reached by all rail. Perhaps 20 per cent. covers the amount of products transported by water exclusively.

About 2,000 hands are employed in the potteries, whose annual wages average $750,000.

For the common grades of manufacture the raw materials are procured in the immediate vicinity of East Liverpool. For finer grades clays are brought from Wilmington, Del., feldspar and flint from Eastern Pennsylvania, Maryland, Connecticut, etc.

When river navigation is closed by ice or low water the trade along the Ohio River and its tributaries is diverted to rail routes and materially increases freight expenses. Owing to the uncertainty of navigation on the river during 1886, no shipments or receipts of pottery or materials were effected by that channel, although if the navigation should be improved as it might be large transactions would be carried on in both directions, to the advantage of every manufacturer along the channel.

The tonnage of general merchandise shipments north or south from East Liverpool by river during 1886 could not be ascertained, as no records are kept that could be summarized upon this point. A rough estimate, however, places this tonnage at 40,000 toward Pittsburgh and about 25,000 down river.

The difference between rail and water rates from this point to other points on the river is estimated at 25 per cent. in favor of the water route.

During the summer of 1887 the comparative rates by river and rail to leading market points from East Liverpool were as follows:

From East Liverpool to—	Rail.	River.
	Cents.	*Cents.*
East Saint Louis	23½	27½
Cincinnati	16	10
Louisville	19	13½
Memphis	22	15
Vicksburg	47	30
New Orleans	47	30

In addition to the pottery interests, East Liverpool has 2 foundries and machine-shops, 2 planing-mills, 2 banks, 30 flourishing retail stores, and a newly completed sewer-pipe manufactory. No details of these were procurable in the short time permitted to procure information at this point.

Mercantile supplies are largely received by rail from New York, Philadelphia, Pittsburgh, Cleveland, and Cincinnati.

So far as the record of steam-boat arrivals at this point is concerned, as is usual with the smaller cities along the river, none has been kept, and the only basis for inferring the number is derivable from the regular annual records of arrivals of Pittsburgh boats kept by the Chamber of Commerce at Cincinnati, each of these boats touching at the

East Liverpool landing upon their up and down trips. Much the same thing must be said for every other down-river port or landing between Pittsburgh and Cairo, where there is no regularly organized commercial body, and the lack of a system of reports of this character for all points is again forcibly recalled at a time when their existence would contribute so much toward making river statistics as full and valuable as they ought to be for the special information of the country at times when the public interest requires accuracy and promptness.

STEUBENVILLE, OHIO.

Steubenville, the county seat of Jefferson County, Ohio, is situated on the Ohio River, 68 miles below Pittsburgh, and at a point below the obstructions that prevent the river from being navigable to its head the year round. It is 30 miles above Wheeling and 400 miles above Cincinnati. At this point the river is about 1,000 feet in width.

The city proper extends along the right bank about 3 miles, with an average width of nearly a mile, including in its boundaries 1,676 acres. The settlement here had its origin in a block-house built to protect the surveyors of the Northwest Territory in 1798. For a long time the infant settlement languished, until a United States land office was located there and the great mineral resources of the country adjacent came to be more generally recognized. These adjuncts brought Steubenville in 1851 to incorporate as a city, and since that date it has made rapid and permanent strides in population and wealth.

The authority previously quoted concerning East Liverpool has the following to say concerning Steubenville:

"The river being at all times navigable southwardly from Steubenville, the city has thus secured to it water communication direct with the Southern markets, from which most of the raw materials come, the greater part of the year. The harbor is spacious and deep, and at low as well as high water it affords accommodation to a large fleet of boats. On the Ohio side of the river are fine, broad wharves, and an admirable ice harbor is formed by the protecting piers of the Pan-Handle railroad bridge, which breaks up the large cakes of ice into fragments as they come down the river. The advantages presented for making Steubenville the headquarters for commerce are being fully realized, and arrangements have recently been made for bringing coal by the Pan-Handle line from places adjacent to Pittsburgh to Steubenville and, by means of chutes erected opposite the city, dumping it into vessels for carriage by water to its destination. This will secure continuous and more economical traffic with the coal fields, etc., at points farther up the river, while hitherto traffic has been liable to interruption by the obstructions in the river at certain periods. Then, during the warm months of the year, packet-boats are run from here to Wheeling and intermediate points, also to Cincinnati, Pittsburgh, and Saint Louis, while many transient steamers are run to points on the Upper and Lower Mississippi, the Yellowstone, and to places in the far West. The great facilities offered for shipping necessarily enlist competition, and this secures cheap freights—an advantage of no small importance to the mercantile community. But in respect of transportation competition is not confined to vessels at the wharves, for a spirited contest for patronage is perpetually carried on by the several lines of railroads which run in and out of the city.

"The Pittsburgh, Cincinnati and Saint Louis Railway is the principal of these railroads. This line had its origin in the Steubenville and Indiana Railroad, incorporated February 24, 1848, and built by Steubenville capital, energy, and enterprise. This line was opened in 1853, after an expenditure of about $300,000 on the part of the township and city, through the public officials and private citizens. With it were associated financial troubles that deprived the original subscribers of the realization of a single dollar from their outlay. Subsequently the work of building the Steubenville and Pittsburgh Railroad was begun, and in connection with this the first railroad bridge over the Ohio was built in 1865. The two roads afterward amalgamated under the name of the Pittsburgh, Cincinnati and Saint Louis Railway, and thus was formed one of the great trunk lines of the country, with communications reaching to all points east and west. In 1856 the Cleveland and Pittsburgh line was extended to Steubenville, giving connections with the Baltimore and Ohio Railroad for the east and the Central Ohio for the west, and also with the Pittsburgh, Fort Wayne and Chicago, Atlantic and Great Western, and other roads. In 1877 the Pittsburgh, Wheeling and Kentucky road gained running powers to the city, and it established connections at its southern terminus with the Baltimore and Ohio line. It is under the management of the Pittsburgh, Cincinnati and Saint Louis Railroad Company. A narrow-gauge line also extends from this city to Richmond, forming important connections with the lake-coast systems of railways as well as with that important water-transportation route east and west.

"The commercial advantages possessed by Steubenville are not confined simply to excellent transportation facilities by land and water, but underlying the city and surround-

ing country veins of coal are found at almost every depth from the surface. Untold quantities of this mineral are easily accessible to market by driving banks in the hills. For heating or smelting purposes the coal here challenges comparison with any other. The price of coal delivered anywhere in the city is from 87½ cents to $1.25 per ton of 25 bushels for steam purposes, with coarser grades at from $1.50 to $1.75 per ton.

"While Steubenville is so favorably situated in respect of a continuous supply of cheap coal, it has an inexhaustible supply of building stone, limestone, fire-clay, iron ore, brick clay, and chemical matters. Limestone may be had in any quantities at $1 per ton delivered. Clays of superior color and quality for fire and red building brick, tiles, and terra-cotta and Rockingham pottery, hard building stone, sand, and minerals may be had almost for the digging. The light-colored sandstone found here becomes somewhat darker by exposure to the air, but is as durable as the hills themselves. Many of the most imposing public buildings in the city are built of stone quarried in the vicinity. Then the city is the center of the greatest wool-producing district, and offers advantages for the manufacture of woolen goods second to none.

"Petroleum has been found within 28 miles of the city on the north, east, and west, but not near the city. Natural gas is within easy reach of the city, and ere long an abundant supply of this will be secured for heating and illuminating purposes. Salt wells have been operated in the neighborhood from the time the city was first settled."

In point of manufacturing industries the city early took a leading position in the trade territory surrounding it. To-day more glass tumblers are made here than in any other city on the face of the globe, and one of the largest glass-pot works in the country is in full operation.

The manufacturing industries employ a capital of nearly $1,500,000, requiring the services of nearly 1,000 hands, and producing products valued at $2,000,000.

The jobbing trade of the city in all departments reaches $1,800,000 annually, fully 30 per cent. of which is carried on by means of the river, at about the same saving in freights over rail lines, as indicated by the figures of East Liverpool.

The fine railroad bridge crossing the river at this point and the traffic over it will be fully mentioned at another place in this report.

No commercial statistics have ever been kept at this point, although the population (8,000) and its important industrial elements would amply justify the labor, and this branch of inquiry, as well as that relating to the river traffic, must be referred for answer to the same points treated as to East Liverpool.

WHEELING, W. VA.

This flourishing river city was first settled in 1774, and was incorporated as a village in January, 1806, having in that period outgrown the insignificance of a frontier trading-post and taken position as one of the leading towns on the great national road traversing the new country west of the Allegheny Mountains and connecting with the more populous and wealthy East. From this point it has not only advanced to the first metropolitan position in the new State of West Virginia, but has had the honor of being the seat of State government for a period of several years. To-day it can boast of nearly 35,000 inhabitants, of as much more tributary population surrounding, and of being one of the great industrial centers of the Ohio Valley.

In this latter particular Wheeling is already widely known, and her principal product has won the *soubriquet* of "The Nail City." For years the excellence of her coal as furnace fuel has enabled successful competition with Pittsburgh in iron and foundry products. Steel was here first substituted for iron in nail-making, and steel, iron, bar-iron, in all their forms and classes, are manufactured here for the markets of the North American continent.

In glass likewise Wheeling possesses a manufacturing interest second only to nail-making. So, too, the queensware potteries have given new prestige to the city as a manufacturing center. Her lanterns, calico, furniture, and leather are used far and wide, and speak volumes for the industry, courage, and enterprise of her manufacturers. In fact, the diversity of Wheeling products is so great that it is no small task to undertake to make a complete list of the industries here established. Among the most important manufactories in iron and steel are Bessemer and foundry pig-iron, Bessemer-steel ingots, billets and nail-plate, steel nails and spikes, sheet-iron and sheet-steel, bar-iron, bar-steel and rails, cold rolled iron and steel, iron and steel pipes, muck-iron, galvanized iron, corrugated iron, iron roofing and car-roofing iron, iron cornices and shaped iron for builders, stoves and grates, hollow ware, engines and boilers, nail-machines, steam-boat machinery, iron vats and tanks, iron chimneys and stacks, stove-pipes, machinery and castings of all kinds, hinges, staples and hooks, iron washers, tacks, hobnails and wire-nails, garden rakes, fire shovels and pokers, iron measures, files, bed-springs, and general iron castings and forgings. In the line of pottery, glass, etc.: Flint and lead glass

table ware, crystal and colored globes and shades, glass chandeliers, ink-stands, and lamps, lanterns and lantern-globes, bottles, flasks, jars, and cruets, both crystal and colored, table queensware, porcelain china, decorated ware, pottery of all kinds, stone crocks and jars, and earthern flower-pots. In woodwork: Wagons and carriages, hubs and spokes, axles, sashes, doors, shutters, barrels, kegs, staves and bungs, hard-wood tierces and casks, wood and paper boxes and box lumber, sawed and planed lumber, furniture, founders' patterns and models, bent wood. In textile fabrics: Calico, stockings, gloves, and suspenders, printing and wrapping paper, leather, sails, awnings, and tents. In metal working: Brass and bronze foundry, tin and sheet-iron ware, copper kettles, copper steam-pipes, electro-plating. In breadstuffs, provisions, and general merchandise: Pork-packing, flour and meal, roasted coffee, baking powder, ground spices, mince-meats, canned goods, preserves and jellies, crackers, candy, butterine, soap and candles, illuminating and lubricating oils, cigars and smoking tobacco, beer, wine, and ale, books and blank-books, combs, brushes, baskets, brooms, brick and lime, chemicals, matches, glue, saddle-trees, saddles and harness, trunks and valises, monuments and headstones, coke.

In addition to this striking category of industrial pursuits and products found in the city proper, there are other industries inseparably bound to Wheeling by the ties of business, of investment, of locality, and of common interest in every direction. Wheeling capital is largely invested in the factories of Bellaire, of Martin's Ferry, of Bridgeport, of Brilliant, of Mingo, of Wellsburgh, and of Moundsville. These communities afford, in addition to those already named, manufactures of hydraulic cement, whips, window-glass, glass molds, glass-melting pots, agricultural implements, mining tools, semolino, etc.

Probably one-half of the entire population of the city are engaged in manufactures as employers, factors, or artisans. Nearly $7,000,000 are invested in her 300 mills and factories, and the annual product of manufactured goods approximates $12,000,000 in value. Of this product probably 30 per cent. is conveyed to market by way of the Ohio River, 12 per cent. being forwarded to Pittsburgh or points between, and the remainder to lower river points. Seventy per cent. is marketed by rail, of which 25 per cent. is taken by the Baltimore and Ohio lines to eastern cities, and 30 or possibly 35 per cent. to western markets by the same line and its connections; the remainder goes both north and south along the lines of the Pittsburgh, Wheeling and Kentucky division of the "Panhandle" system, the Cleveland, Lorain and Wheeling, and the Ohio River railroads. These same routes bring raw materials and general merchandise into the city from other producing points in nearly the same proportion as to routes and points of supply. The Ohio River Railroad is now being extended along the eastern bank, so that the vast coke, iron ore, and lumber products of the Kanawha and New River valleys will soon be brought to her doors by the more rapid means of rail transportation, and her manufactures will thus receive added impetus and firmer establishment.

Unfortunately no commercial or industrial statistics are kept at Wheeling by any authority, and it is impracticable to give more than the foregoing general treatment to a most important subject.

For a statement of tonnage by rail across the river, 4 miles below Wheeling, from Bellaire, Ohio, and a description of the bridge at that point, see the appropriate divisions of this report.

The ferriage business between Wheeling, on the east bank of the river, and the neighboring towns of Bellaire, Martin's Ferry, and Bridgeport, Ohio, is largely passenger traffic and transfer of finished goods for shipment west from Wheeling manufactories. No record of tonnage is kept by the ferry officials, and the tonnage can not be even averaged by any reasonable process. For boats engaged in this transfer business reference is made to the list of vessels registered at the port of Wheeling.

BELLAIRE, OHIO.

Bellaire, located upon the Ohio side of the river, about 4 miles below Wheeling, W. Va., is as fully entitled to be called "The Glass City" as Wheeling is to be known as the "Nail City."

The principal glass manufactories located at this point are classified as follows:

Articles made.	Number establishments.	Capital.	Number hands employed.	Annual value of output.
Window glass	4	$220,000	325	$350,000
Tableware, etc	4	375,000	755	590,000
Lanterns, etc	3	85,000	150	135,000
Bottles, etc	1	50,000	100	100,000

OTHER LEADING INDUSTRIES.

Stoves and castings	1	200,000	90	375,000
Tinware, stamped	1	40,000	30	150,000
Cement-mills	1	50,000	75	125,000
Flour-mills	2	125,000	40	320,000
Glass-house pots	1	20,000	25	75,000
Cooperage	2	115,000	150	350,000
Planing-mill, etc	1	75,000	25	125,000
Steel nails, billets, etc	1	500,000	700	2,000,000

In several of these establishments natural gas has heen introduced as fuel from the Wheeling Company's pipe line, and the result has been, as elsewhere, to greatly improve the cheapness and superior excellence of the manufactured product.

Of Bellaire's trade by river, tonnage, classification, and value not ascertained, fully 90 per cent. is first transported to Wheeling and loaded upon boats of regular lines which do not touch at Bellaire, for down-river freights, of which the percentage shipped in this way is nearly represented by the figures named. The down-river markets include every important city or landing on the Lower Ohio as far as Cincinnati, which serves as a final reshipping and distributing point. Occasionally direct through shipments are made to Mississippi River points, but not often.

The East and West shipments by rail are carried over the Baltimore and Ohio Railroad, and find markets at most cities and towns in the territory reached by that line and its connections. The tonnage thus carried can not be certainly approximated. The railroad keeps no local tonnage statistics for this point, and can only furnish a statement of gross tonnage carried across the bridge at Bellaire.

A considerable amount of merchandise is carried north and south by rail by the roads extending in those directions along the river; as far as Steubenville on the north and Marietta and Belpre on the south.

The development of the present railway system has not interfered materially with shipments by river at boating stages or seasons of open navigation, but in the annual aggregate the railroads have gained an advantage from the traffic diverted to land lines when the river has offered no facilities.

So far as freight and passenger rates are concerned between competitive points of trade and population the river interest has, to all appearances and by all accounts suffered little, if anything. As a general rule, the rates by river for freights and passengers for corresponding distances are about 15 per cent. less than by rail.

Bellaire draws her general supplies of raw materials and general merchandise for local trade and manufactures from nearly every point of the compass, and to discriminate between amounts of each commodity and its source of supply would be impracticable in the absence of all statistics bearing upon the subject.

BRIDGEPORT, OHIO.

This town, located opposite the city of Wheeling, has considerable importance as a manufacturing and shipping point. It is connected with Wheeling by a bridge, crossed by a line of street railroad, as well as by a ferry.

The principal industries are as follows: An iron and steel manufactory, having 32 puddling furnaces, a scrapping furnace, a three-high muck, two sheet, one plate, a guide and a break-down mills with the requisite heating and annealing furnaces. Its product consists of bars, sheets, plates, small T-rails, and street rails rolled either from iron or soft steel. This mill uses natural-gas fuel, has a capital stock of $400,000, and gives employment to about 600 workmen; a large planing mill, doing an extensive lumber business; an extensive foundry and general machine shop; a brick factory, turning out about 10,000,000 brick annually; two large roller flour mills; a stove foundry; a concern largely engaged in manufacturing glass jars and bottles, and the Wheeling Creek Coal Company, a corporation operating extensive mines of fine coal a few miles west of the town.

It is chiefly as a cross-river shipping point for Wheeling manufacturers that Bridgeport takes commercial position, as the Cleveland and Pittsburgh, and Cleveland, Lorain and Wheeling lines pass through the town, and receive and discharge large consignments of freight from and for Wheeling. As usual, however, no statistical records are kept here of this class of business; and the railroads are unwilling to undertake the labor of working out these details for the present purpose without being reimbursed for the very considerable expense which would thereby be entailed.

MARTIN'S FERRY, OHIO.

This thriving city of 8,000 inhabitants is located on the river just opposite the upper portion of Wheeling. It has the same railroad advantages possessed by Bridgeport, and, like that town, is thriving as a manufacturing point.

Besides the Laughlin mill, which is one of the largest steel-nail factories in the world, there are located here the blast furnace of the Berwood (Wheeling) Iron Works, employing 50 men and producing from 65 to 75 tons of Bessemer pigs daily; an establishment for the manufacture of self-feeding nail machines; a novelty steel mold works for making all sorts of glass-makers' shapes; a foundry and machine shops for producing roll-mill, blast-furnace, and steel-plant castings; two large stove foundries; a keg and barrel factory, turning out a million packages annually; a couple of large glass works, manufacturing lamp chimneys, lantern globes, bar goods, lamps, tableware, etc.; the Ohio Wine Company, making 100,000 gallons of fine domestic wine per annum; two large planing mills; two factories of threshing machines for grain, besides a number of other minor establishments.

The same remarks made concerning the trade of Bellaire are applicable to Martin's Ferry.

MARIETTA, OHIO.

This city was the initial settlement made in the Northwest Territory, and will celebrate the centennial of the settlement in April, 1888. The place now has about 8,000 inhabitants, not counting the 2,000 inhabitants of Harmar, located just opposite on the southern shore of the Muskingum River and practically united to the larger city.

Marietta's situation at the mouth of the Muskingum and upon the borders of the Macksburgh oil and coal fields, gives her a favorable commercial position and a large importance in the trade of the territory surrounding for a radius of more than 50 miles in every direction.

Her principal manufactories are: A large foundery and stove works, a chair and furniture factory, an extensive tannery, a hub and spoke factory, two considerable petroleum refineries, and several large saw-mills, some of which are connected with boat-building interests of a minor class.

In Harmar there are: A factory of canned goods and refrigerating depots for perishable goods, such as eggs, fruits, and vegetables, a foundery manufacturing stoves, a grindstone mill and two large oil refineries.

The two cities are reached by the Cleveland and Pittsburgh, Cincinnati, Washington and Baltimore, and Marietta Mineral Railways, and a new line extending from Zanesville, Ohio, along and down the Muskingum River to Harmar is in course of construction.

Concerning the refining of petroleum oils, which is the most important industry for each of the cities named, the following particulars were obtained from one of the leading capitalists engaged in this branch of trade:

Crude oil is refined annually at Harmar and Marietta to the extent of 100,000 barrels. This average obtains since 1880.

Of this product three-fourths is shipped by rail, going south and west; one-fourth goes down the Ohio River by boat. About 75 per cent. of the product of the refineries is coal-oil, and the estimated value of the same is: Refined product, $300,000; benzine, tar, etc., $50,000.

The river rates on these goods to Cincinnati (and the same may be said generally concerning general merchandise freights in that direction) are about two-thirds of the rates charged by rail. A like difference exists in the river and rail rates to Louisville and Memphis, although this disappears from the tariff to New Orleans. Thus it is apparent that transportation by river to these upper river points continues cheaper than by rail. To Saint Louis the competition of rival railway lines has made rates lower than by water.

The chief factor opposed to cheaper river transportation is the usual closing of the river for a period of three months each year by ice, and the uncertainty of a boating stage during a month or six weeks more during each summer. There is the desideratum of greater speed of conveyance also to be urged in favor of rail transportation, which at certain times of extraordinary demand for supplies is a most important consideration and will nearly always give the railroads the preference.

The trade coming out of the Muskingum at Marietta and Harmar consists largely of grain, live-stock, and farm products. Considerable hard-wood timber is rafted down to the Marietta mills, but no special statistics are kept here. So far as could be learned the tonnage and classification of freights to and from this point are given in the general table showing the commerce by individual boats plying the Ohio River and its tributaries.

PARKERSBURGH, W. VA.

The next point of importance on the river below Marietta is Parkersburgh, W. Va., a city of about 15,000 inhabitants, and the second in size in the State. Like Wheeling, it has been for a time the seat of State government, now removed to Charlestown, a more central position. Situated at the mouth of the Little Kanawha, it early enjoyed a large tributary trade up the Kanawha Valley, and held a considerable share of the trade passing up and down the Ohio.

The city owes much of its present commercial prosperity to the Baltimore and Ohio Railroad, whose main line terminates here, and is represented by valuable investments in shape of warehouses, machine-shops, etc. The Cincinnati, Washington and Baltimore line also has its eastern terminal here, and the magnificent bridge crossing the river between Belpre and Parkersburgh is owned by the former company. For particulars concerning this bridge and the transfluvial traffic, reference is made to the corresponding divisions of this report.

The leading industries of Parkersburgh are: First, the refining of petroleum; second, flour manufactures; and next, saw-milling and lumber products. Aside from these there are the usual mechanical industries to be found in a city of this magnitude, all of which enterprises are steadily growing, and represented to be in a most flourishing condition. The city has a large number of handsome buildings, is well laid out, paved and lighted, and enjoys a magnificent system of water-works recently constructed.

The establishments refining petroleum oils are three in number, and turn out annually about 300,000 barrels of coal-oil, valued at nearly a million dollars, and about $500,000 worth of other residuary products. These goods are shipped principally to Eastern and Western markets by rail; only about 20 per cent. going to market down the river. The same conditions mentioned concerning the trade at Marietta will also apply to the Parkersburgh refineries. Nearly all the crude petroleum of West Virginia and Southern Ohio is handled by the refineries of Marietta, Harmar, and Parkersburgh, a small portion being shipped by rail in tanks to the Cleveland refineries, operated by the Standard Oil Company.

The product of flour from the Parkersburgh mills has an extended sale, reaching nearly all points on the lines of railway centering here, and a considerable amount going to markets on the lower Ohio and Mississippi Rivers for distribution in the Southern States. The output of the lumber mills reaches a market by rail, principally. Supplies of raw material are conveyed to Parkersburgh mainly by river. From the Little Kanawha hard-wood rafts, coal, and petroleum are received, but the quantity or value could not be ascertained. From Charleston and Elizabeth, W. Va., large supplies of grain, etc., are drawn by the boats running through the country between those points and Parkersburgh, and reference is made to the table of statistics covering the details of river transportation for information upon these special points.

It is stated by local authorities that the passage of the interstate-commerce bill has had a tendency, so far, to benefit the river interest at this point, and that an appreciable increase in water transportation has been made since the law went into active operation. How long this may be maintained, in face of the readjustment of rates based upon mileage by rail between common points of competition remains to be seen, but there is unquestionably, at present, a feeling of satisfaction among river men over the outcome in view of their recent experience.

There are three packet-boats running tri-weekly trips each between Parkersburgh and the head of the regular navigation on the Little Kanawha at Elizabeth, W. Va. These boats take up on each trip conjointly 2,476 tons of freight and bring down 3,130 on a fair average during boating stages, *i. e.*, about thirty-seven weeks during each year. The down freights consist largely of native agricultural products of the region, tan-bark, etc., and the up shipments consist of general supplies for the adjacent country, which are mostly handled by jobbers at Parkersburgh. For such particulars concerning this trade as could be procured from parties connected with it, reference is made to the schedule table of bottoms and tonnage engaged in Ohio River commerce.

In former years, before the advent of the numerous light-draught boats built for trade on the tributaries of the Ohio River, there was a considerable flat-boat traffic out of the Little Kanawha in native products to down-river points, extending as far as New Orleans on some occasions; but this form of traffic is now principally confined in a comparatively small way to the rafting of logs of hard wood down this stream to the mills at Parkersburgh, and for rail transshipment to Eastern and Western markets In this way much of the ash, walnut, and cherry timber has been carried from the forests adjacent to the Little Kanawha where railroads are not located near enough to make all-rail transportation feasible. There is, unfortunately, no regularity of shipment in this class of traffic, and no statistics kept either at receiving or shipping points that could be made available for the purposes of this report.

The trade between Parkersburgh and Muskingum River ports and landings extends as far as Zanesville, the head of navigation on that tributary stream, and consists of refined oils, foundery castings, and some hard-wood lumber on the up trips, and general merchandise, and on the down trips, of glassware, agricultural implements, brick and tile, leather, canned fruits and vegetables, flour, manufactured tobaccos, woolen goods—spun and woven—and a great variety of other miscellaneous goods. Considerable poplar and white-walnut timber is rafted down the Muskingum, but it nearly all is consumed by the Marietta furniture factories and lumber mills.

The volume of this trade has not varied much for a number of years, neither will its classification or value be found to depart very far from the figures given in the special tables of river traffic.

The approaching completion of a line of railroad between Zanesville and the mouth of the Muskingum, along the southern bank, will give this trade all-rail facilities and impair the present trade by river very greatly.

POMEROY AND MIDDLEPORT, OHIO.

The next landings and towns of importance on the river below Parkersburgh are Middleport and Pomeroy, on the Ohio side. These places are about 4 miles apart, Pomeroy being the farthest down. Both towns are largely engaged in mining and the manufacture of iron, although a fine trade is drawn from the rich agricultural regions lying back from the river.

Middleport has a steamer, the *Luella*, making tri-weekly trips to Gallipolis, down river, and return, carrying 25 passengers and an average of 11 tons of freight per round trip; also a boat making trips to Louisville and way landings, weekly, carrying 30 passengers and 14 tons of freight on each average round trip. The town is also a point of call for all the boats of the Pittsburgh and Cincinnati Packet Line, and contributes a heavy tonnage of freights both ways.

Pomeroy, the larger of these towns, has a wealthy iron interest, as well as a heavy investment in coal, and enjoys a correspondingly large trade, both by river and rail. It has direct railway connection at Athens with the Cincinnati, Washington and Baltimore main line, and sends a considerable tonnage of coal and pig-iron freight both east and west by that means, and the line to Gallipolis, extending down the river, likewise carries much to and from Pomeroy that formerly went by rail.

Down-river shipments of coal and iron products, however, to Cincinnati, Louisville, and other lower-river markets, are continuous at good boating stages, are cheaper than by rail, and at the same time profitable river freightage.

The tonnage of merchandise, etc., could not be ascertained, as no statistics are kept for publication by any organized commercial body.

The general effect of railroad competition upon river traffic, so far as individual opinions of leading shippers and steam boat-men could be gathered, has been to reduce both the volume and rates of that class of freights. Since the interstate-commerce law went into effect river men are practically unanimous in saying that their interests have been considerably benefited and their traffic appreciably increased upon the basis of long hauls. There is no portion of the river better calculated to afford a nearly accurate estimate of the effect of the law just referred to than this lying between the Little Kanawha and the Big Sandy, for the reason that here a large number of supply points of original freights adjoin the main river, most of which on one side have no rail facilities and on the other side abundant rail connections, and all at the same time situate about equally remote from any great commercial center. Thus the facilities for careful comparisons upon this point with other sections of the river are most favorable. Between Louisville and Cairo, when that portion of the field comes to be considered, quite a different condition of things will be found to exist due, no doubt to the marked difference in that region in means and facilities of transportation.

The remaining points concerning the volume, classification, and value of Pomeroy's regular river trade will be found in the schedule table published on subsequent pages.

POINT PLEASANT, WEST VIRGINIA.

This place holds a similar commercial relation to Gallipolis, Ohio, that Pomeroy and Middleport sustain to one another, being but a short distance apart, having very much the same character of trade, and being on a fair equality so far as railway communications are concerned.

Point Pleasant has a present population of 2,500, and is an enterprising place, certain to rapidly enlarge in every material and social way. The county of which this is the seat of justice has a population of 27,000. The facts presented concerning Point Pleasant

are due to Col. John Smith, who is one of the very few men living along the river evincing interest enough in this special inquiry to answer categorically and intelligently the circular letter B of the Department.

There are here in active operation nine manufacturing establishments, namely: 1 furniture factory, 2 flour mills, 1 soap factory, 1 saw mill, 1 boat-building factory for skiffs, etc., 1 foundry and machine shop, one steam tannery, and 1 steam brick works. In the county there are 20 manufacturing plants exclusive of those in town, namely: 7 salt works, 4 saw mills, 2 flour mills, 4 coal mines, two bromine works, and 1 boat-building establishment. Nearly all of these are of long establishment; precise dates not accessible.

During 1886 the salt works turned out a product valued at $350,000; the saw mills, about $50,000 of hardwood lumber; the flour mills products, valued at $40,000; the coal mines yielded about $25,000 each; the bromine works, $10,000 each; and the boat factories about $10,000 each. The product by trade measurement was not ascertained for either of the establishments. The capital invested is about as follows:

Salt works	$350,000
Coal mines	100,000
Saw mills	50,000
Bromine works	10,000
Boat-building	20,000

Nearly all of the capital invested is owned by residents of the county.

Of these manufactured products the salt finds its main distributive market at Cincinnati, and the furniture and bromine at New York. Lumber and boats are shipped almost wholly down the Ohio River to Western markets. Fully nine-tenths of each kind of manufacture goes out of the State, and nearly all is shipped by the Ohio River.

The operatives employed in each of these manufactories are as follows: In the coal mines, between 50 and 100; salt works, 50; bromine works, 4 or 5; saw mills, 12 or 15; furniture factory, 100; flour mills, 6 or 8; boat-building concerns, 50. Common laborers receiv $1 per day as wages, and the pay ranges for different grades of skilled labor up to $3 per day. The amount disbursed for annual wages in these factories, etc., could not be learned. The raw material of manufactures is produced mainly in this county. When navigation by river is closed it reduces local commerce, and the factories, mines, etc., ship very little of their outputs.

Questions numbered from 16 to 21, inclusive, of the circular of inquiry Colonel Smith was unable to answer.

River freights are about $2 per ton cheaper than rail rates from Point Pleasant to other points on the river touched by rail, and there is no special departure from this figure at any season when boats are running. The competition of railroads has materially lessened the volume of passenger carriage by river, but has not affected the freight traffic. No rates are made from here by river to points below Cincinnati; everything of freights going below that point is always rebilled there, so that the following rates between Point Pleasant and Cincinnati govern the traffic at all seasons:

		Cents.
Salt	per barrel	.10
Flour	do	.10
Wheat	per bushel	.04
Corn	do	.05

Very nearly all the shipments and receipts by river at this point are carried by the Cincinnati and Pittsburgh boats and by the Pomeroy line.

The Big Kanawha unites with the Ohio at Point Pleasant and the latter river is bridged here by the Kanawha and Ohio Railway, for a description of which structure reference may be made to the portion of this report relating to the subject of Ohio River bridges. The bridge over the Kanawha here was constructed by the Ohio River Railway.

There are a couple of boats engaged in the Kanawha River trade between Point Pleasant and Charleston, the capital city of West Virginia. Statistics of freights, etc., for this line are found in the appropriate schedule made a part of this report.

The ferriage between Point Pleasant and the Ohio shore at Gallipolis is insignificant, the principal business being passenger transfers, amounting to an average of 16 daily and 5 tons daily of miscellaneous freights. Nearly all of this is from Gallipolis to the West Virginia side, and the business occupies about five months in each year, the freight being mainly brick and lumber. The principal freights out of the Kanawha are timber, lumber, salt, etc. In the autumn there is a considerable flat-boat traffic proceeding from the Kanawha to Ohio River points as far down as Louisville, the cargoes consisting principally of apples and potatoes. No statistics of the volume or value of this trade are procurable, but it is admitted that within this decade the business has very largely fallen

off from its previous proportions. This fact is attributed to the enlarged carrying capacity and active competition for freights between the numerous light-draught boats running "independent," and the regular line boats, for this class of trade. The day of the old-fashioned "broad-horn" in boating annals is nearly ended so far as Ohio River commerce is concerned. Besides the cause alluded to as special, the improved system of towing has had much to do with demolishing this steamless fashion of navigation. What is said here concerning flat-boating out of the Kanawha is equally applicable to the Big Sandy, the Kentucky, the Cumberland, the Wabash, the Tennessee, and every other navigable tributary of the Ohio.

There is but little wholesale trade done at Point Pleasant, save in the matter of domestic manufactures, and no statistics are kept of the amount of sales. Mercantile supplies are received by river from Cincinnati and by rail from Philadelphia, New York, and Baltimore. The distributive trade does not extend beyond the county, and Gallipolis is the principal competitor for trade coming out of the Kanawha region and from points above and below on the Ohio River. For many years past, during open navigation, the steam-boat arrivals at this place have averaged 20 per day. There are no statistics to show the total annual tonnage for any past year.

GALLIPOLIS, OHIO.

This town is situated on the Ohio River, about 5 miles below Point Pleasant, and has about 8,000 inhabitants and the usual manufacturing enterprises found in border communities of this size. Its river and railroad commerce about evenly balance. It has up-river rail connection with Pomeroy and connection to the northwest at McArthur with the Cincinnati, Washington and Baltimore Railroad, formerly known as the Marietta and Cincinnati Line.

No statistics of consequence or of accuracy could be gathered here, although most diligently sought, nor, so far as could be learned, have any ever been published concerning the commerce or industrial investments of the town.

All the regular packet lines plying the river between Cincinnati and Pittsburgh touch here for freight and passengers, and obtain a fair share of business in both, which is not separated in the general schedule of river commerce for obvious difficulties in the way.

A local line, comprising two boats, alternate daily trips between Huntington and Gallipolis, carrying an average of twenty passengers to the round trip and 18 tons of freight of a general character. A boat likewise makes regular daily trips between Pomeroy and Gallipolis, that averages twenty-five passengers and 10 tons of freight daily.*

Between Charleston, W. Va., and Gallipolis two boats alternate round trips tri-weekly, carrying an average of thirty passengers and 15 tons of assorted freight per round trip.

Between Gallipolis and Middleport, Ohio, a small steamer makes tri-weekly trips, carrying an average of twenty-five passengers and 11 tons of miscellaneous freight.

There is also a boat making semi-daily trips between Point Pleasant and Gallipolis in the nature of a ferry. This craft averages eight passengers and 2½ tons of freight to the round trip.

The above lines comprise about all that can be said concerning this town, and further particulars may be learned from the schedule list of Ohio River boats, their tonnage, etc. The railroads touching here and at Point Pleasant, on the opposite shore, do not keep statistics in a shape that renders it possible to show the tonnage or classification transferred between the points named by ferriage or by consignment to either up or down river lines.

HUNTINGTON, W. VA.

This town has gained prominence mainly through being at the mouth of the Guyandotte River, which in the last quarter of a century behind the present decade furnished a distributing point for interior products of the mountain region of the Virginias unsurpassed by any other along the river frontage between Pittsburgh and Cincinnati. Here the stores of supply for the trapping regions were once located, and the mountaineers brought their peltries and the products of small farms to be forwarded to the best market. The aggregated "plunder" of the Scioto, Big Kanawha, and the half-dozen minor streams permeating this vast region all contributed of their stores and products to swell the flotilla of flat-boat loads gathered for the voyage down the Ohio, when, in the words of the old boating song that has so often echoed among the cliffs and wooded shores of La Belle Riviere:

> The river is up, and the channel is deep,
> The stream flows steady and strong.

Now, however, the advent of the Chesapeake and Ohio Railroad, creating a great through route between the South and West and the Eastern seaboard markets, has nearly wiped out these primitive means of transportation, and the numerous swift, light-draught steamers now in the watery field between Pittsburgh and New Orleans have contributed to finish the old transportation régime.

The old town now has a busy population of at least 5,000, which is growing rapidly with the swift development of the rich mineral and agricultural fields lying adjacent and behind the city.

The freights handled here by river are carried principally up and down by the Cincinnati and Pomeroy Line, by the Cincinnati and Pittsburgh boats and the vessels of two local lines; one of the latter running hence to Portsmouth and the other to Pomeroy. (See schedule of boats, etc.) The estimated amount of freight conveyed to and from Huntington, by the city wharf-boat reckoning, is about 100 tons daily, consisting of a wide range of products of the field, forest, and mine. The steamer *Louise* makes daily round trips between Huntington and Portsmouth and handles about 100 tons of freight daily through the boating season. The steamer *George Strickler* runs between this point and Pomeroy, making daily trips each way, and handles about 50 tons per day of various freights. No boats, except flats or rafts, run up or out of the Guyandotte, and no estimate of tonnage for that stream could be procured. The Chesapeake and Ohio Railroad (now known as the Newport News and Mississippi Valley Railroad), has a wharf-boat here, and formerly a large amount of freight was transferred from the river to the railroad for shipment direct to Eastern markets, but since rail extension westward along the river has been made nearly all this class of freight goes direct by rail. The ferry business here does not amount to much, as there is no railroad on the Ohio side to make a regular transfer business; consequently ferrying is only carried on between Huntington and a couple of small villages on the west bank that have no other trade outlet or accommodation. The railroad brings large quantities of pig-iron and considerable crude ore to the river for water transportation to Pittsburgh. Last year the tonnage of this class of freight aggregated nearly 80,000 tons. Huntington draws a large portion of her merchandise supplies from the river and distributes them to the mines and stores in the back country.

No historical sketch of the city or of its commerce, nor statistics of manufactures, etc., could be secured.

CATLETTSBURGH, KY.

This town is located on the west bank of the Big Sandy, at its confluence with the Ohio River, and is likewise reached by the Newport News and Mississippi Valley Railroad. It occupies an important position on the river as a reshipping and distributing point for the products of the Big Sandy country, than which none is richer in minerals, fine timber, and agricultural products, although the town itself is comparatively insignificant and primitive. It is here that the "broad-horn" traffic survives more than at any other point along the entire length of the Ohio.

The Big Sandy is navigable at ordinary boating stages as far as Louisa, Ky., 75 miles up that stream, penetrating, as already intimated, through vast forests of hard woods, almost undisturbed stores of iron and coal of inexhaustible dimensions, and opening a way for the simple but necessary and valuable products of Eastern Kentucky and Western Virginia farms to reach profitable markets.

The principal river traffic is enjoyed by the regular Cincinnati, Big Sandy and Pomeroy, and the Cincinnati and Pittsburgh boats. The steamer *Louise*, on her trips between Huntington and Portsmouth, succeeds in picking up about 100 tons daily at this point, and the irregular boats sometimes cut in and steam off with large loads, despite their more legitimate rivals.

The local wharf-boat handles about 50 tons daily for up and down river ports, all the year round, as an average.

The *Ingomar*, *Spenlock*, *Frank Preston*, *W. B. Jones*, *Sonoma*, and *Independence* are the boats constituting the regular Big Sandy fleet, and bring out to the Ohio sorghum, beans, wool, feathers, dried and green fruits, and vegetables, with enormous quantities of flint hides, peltries, and lumber. They carry up groceries, dry-goods, ironware, hardware, and salt, and a general assortment of supplies for the interior region.

The tonnage going up the Big Sandy will average at least 100 tons daily for five months every year; going down into the Ohio, the daily average tonnage for an equal period is not less than 50 tons. The value of the down freights is estimated at about $5,000 daily. Of the value of up freights no estimate could be obtained.

The Newport News and Mississippi Valley Company brings a large tonnage of freights to the river at Catlettsburgh, for transfer up and down. This consists largely of clothing, dry-goods, boots and shoes, etc., but the reports of the company do not show the proportion of each nor their values.

There is an immense flat-boat traffic out of the Big Sandy into the Ohio River at this point. It is estimated that not less than 100 of these boats float down to Catlettsburgh annually, loaded to the water's edge with staves, hoop-poles, tan-bark, fruits, and vegetables, and considerable coal, iron ore, and grain. On their return trip, towed up by the steamers plying the Big Sandy, they are again loaded with general merchandise

supplies, and thus are enabled to make considerable profits. Many of them pass down the Ohio, disposing of freights, as far as Cincinnati and Louisville, and often as many as 20 will pool their interests, fasten together into single tows, and make the voyage with the aid of steam.

There being no cross-river railway connection made at this point, the ferry business is both limited and local, as it is at Huntington. The average business, the year round, for the ferry line is about 15 passengers and 5 wagon-loads of farm "truck" daily.

No information concerning comparative rates to competitive market points by rail or river could be obtained here, but it is safe to say that the difference the year round is insignificant.

The interstate-commerce law, however, has had no appreciable effect upon passenger rates to or from this point. It has, on the contrary, it is stated, operated to largely increase the through business of the Cincinnati and Pittsburgh boats, both in respect of passengers and freight tonnage.

The industrial enterprises of Catlettsburgh are yet in their infancy, and, as might well be expected in the circumstances, no accurate estimates of capital, labor, wages, or products are procurable.

IRONTON, OHIO.

This is the county seat of Lawrence County, Ohio, and an important point in the river trade. It has a present population of about 10,000, and considerable investments in iron working and minor manufactures, aggregating, as nearly as could be ascertained, $550,000, and turning out products valued at $600,000 annually, consisting mainly of agricultural implements, pig-iron, flour, and furniture. It is the terminus of the Cincinnati Eastern and a branch of the Scioto Valley Railroads, the former extending westward along the river to Portsmouth, the next point of consequence down the river, and the latter opening a commercial route to the northern lakes.

The city is a stopping-place for all the regular lines of steamers plying the river between Pittsburgh and Cincinnati, and furnishes to these boats large quantities of miscellaneous freights and receives considerable in return. No statistics have ever been kept locally of these transactions, and the tonnage and values of freights carried to and from Ironton are necessarily merged in the annual business of the boats which pass and touch here, as given in the general schedule of river commerce elsewhere in this report.

The same must be said of Ashland and Greenup, Ky., a short distance, respectively, above and below Ironton, each of which has a large trade by river, but possessing absolutely no facilities for ascertaining amounts or values for the precise purposes of this work.

There is a boat making weekly trips between Ironton and Pittsburgh, carrying an average of 25 passengers on the round trip and about 400 tons of general freight; also a boat plying tri-weekly between Ironton and Pomeroy, averaging 20 passengers and 45 tons of freight to the trip. With these exceptions the river trade is monopolized by regular lines, as above specified.

The railroads carry about two-thirds of the general freight received by the city and convey away one-third of the manufactured products. Rates by river and rail show nearly the same differences as for points above, where the two modes of transportation come into competition, the general average being rather in favor of the river from and to common market points.

PORTSMOUTH, OHIO.

This place was laid out and established in 1801. At the lower end of the town plat the Scioto River approaches within sixteen to twenty rods of the Ohio, and then, by a broad sweep, recedes and enters the latter at Alexandria, a mile below.

From 1810 to 1820 the settlement slowly but steadily improved as the rich country around became cleared and cultivated, and a considerable business intercourse grew up between Portsmouth and the Upper Scioto Valley by means of keel and flat boats navigating the Scioto. Much of the produce, corn, pork, flour, and whisky was brought down in this way and reshipped or floated directly through to Lower Ohio and Mississippi River markets, sometimes as far as New Orleans.

On the completion of the Ohio and Erie Canal, in 1830, Portsmouth took a fresh start, and her commercial prosperity from that date to the present has been almost unimpeded. The advent of railroad connections in 1850 has completed what was previously lacking to her permanent trade, and the fact that, from a place of not quite 2,000 in 1840 she has reached a population of nearly 15,000 is sufficient evidence of industry and enterprise properly rewarded.

The manufacturing interests of the city are now taking on large proportions. The principal products of these establishments are iron, machinery and boilers, stoves, road-scrapers, steel springs, wagon materials, wagons, buggies, wheelbarrows, railroad cars, fire-brick, sawed stone, furniture, boots and shoes, paper, soap and candles, brooms, saddles and harness, hosiery, knit and woolen goods, cooperage, distilled and malt liquors, tobacco, etc. The value of these products is estimated at nearly $5,000,000 annually, while the sales of general merchandise will aggregate fully as much additional. No special statistics are kept here and precise figures are unprocurable.

The city has ample competitive facilities for transportation. On the north the Scioto Valley Railway connects it by air line with Chillicothe, Columbus, and all Central Ohio points. On the east 40 miles of water transfer brings its products to the Newport News and Mississippi Valley line. A branch of the Cincinnati, Washington and Baltimore lines provides connections with the Baltimore and Ohio system to Eastern cities and with Cincinnati and the West, and the Cincinnati and Eastern Railroad, running west, connects the city by a direct line with Cincinnati.

The down-river traffic from Portsmouth is carried on by the Cincinnati, Portsmouth, Big Sandy, and Pomeroy line, and by the steamer *Handy No.* 2, with unimportant exceptions. Up-river shipments are made by the steamer *Louise*, and the Cincinnati and Pittsburgh line, or by Wheeling boats.

The *Handy No.* 2 runs between Portsmouth and Maysville, Ky., making daily trips, six times per week, and carries about 50 tons of freight per round trip. This freight consists principally of general merchandise and lumber, and averages about $5,000 in value per trip.

The steamer *Reliance* makes six daily trips per week between Portsmouth and Vanceburgh, Ky., carrying about 20 tons of freight daily, made up of general merchandise and wagon materials, averaging a trip value of $2,000.

The steamer *Boone* runs from Cincinnati to Charleston, W. Va., touching here and receiving and discharging a considerable cargo at each weekly visit.

The city wharf-boat handles a daily average of 150 tons of miscellaneous freights.

There is but one ferry-boat at this point, the *Susie Brown*, whose operations are between Portsmouth and adjacent river landings. She will average twenty-five passengers and twenty-five loaded teams per trip the year round. Her freights are mainly agricultural products.

The Scioto is no longer navigable for any class of large boats, and even the flat-boat traffic has ceased upon this stream.

The interstate-commerce law has had no effect upon the average rates by river and rail to competitive points. By water the rates are 24 cents per 100 pounds on wheat and corn from this point to Cairo, and all-rail rates are about the same. Passenger rates are likewise materially unchanged. It is thought, however, that since the law went into effect a slight improvement in the volume of river freights is discernible, but it is not certain that this is not attributable to a general increase of traffic during the past year over all routes of transportation, due to an improved condition of trade everywhere.

MAYSVILLE, KY.

The only landing of importance between Portsmouth and this point is Vanceburgh, Ky., which possesses a good trade in lumber, tan-bark, and agricultural products, nearly all of which finds a market at Cincinnati, Covington, and Newport.

Maysville, the chief town of Mason County, Kentucky, has a population of fully 10,000, and is a thriving river and railroad town. The Maysville and Lexington line, extending between the places named, is a portion of the Kentucky Central Railroad, and is now operated as a part of the Cincinnati Division of the Chesapeake and Ohio system (latterly known as the Newport News and Mississippi Valley line).

Here a great quantity of freights, drawn from the rich "Blue Grass" country lying behind the city, is taken both up and down the Ohio to the larger markets, and a large amount of manufactured products are also transported to interior points. The principal industries are leaf and manufactured tobacco, whisky, lumber, cotton, hemp, agricultural implements, flour, and pork. In these interests nearly $2,000,000 of local capital is employed. The value of merchandise received from points outside of the State and the value of surplus products shipped out of the State is approximated by the following table in the matter of river transportation, no records of shipments, receipts, or values being attainable in summarized shape as to rail transportation:

Principal industries.	Establishments.	Capital.	Merchandise received from markets outside of State.		Surplus products shipped out of State.	
			By river.		By river.	
			Northeast (up).	Southwest (down).	Northeast (up).	Southwest (down).
Agricultural implements	4	$350,000	$12,500	$50,000	$5,000	$8,000
Boots and shoes	15	40,000	.....	50,000	14,000	12,000
Carriages and wagons	6	50,000	15,000	20,000	5,000	2,500
Cotton factories	2	300,000	.....	200,000	15,000	200,000
Dry goods	9	175,000	.....	200,000	5,000	2,500
Distilleries	2	100,000	5,000	8,000	5,500	65,000
Flouring mills	4	80,000	25,000	20,000	22,000	25,000
Founderies	1	15,000	5,000	10.000	2,500	2,500
Groceries	30	75,000	.....	80,000	5,000	5,000
Hemp and grain	4	20,000	10,000	10,000	.....	.....
Lumber	4	80,000	25,000	8,500	.....	.....
Pork packing	1	25,000	.....	.....	.....	.....
Saddlery, etc	4	20,000	2,500	12,000	2,000	500
Tobacco, manufactured	11	55,000	.....	45,000	2,000	2,500
Tobacco, leaf	7	245,000	15,000	5,000	.....	130,000
Miscellaneous	49	163,500	37,500	162,000	18,300	25,900
Total	152	1,803,500	152,500	880,500	101,300	481,400

All of the lines dispatching steamers up and down the Ohio receive heavy freights here and, as will be observed, drop much general merchandise for the jobbing trade with the interior country. The principal market for sale and purchase is Cincinnati.

The *St. Lawrence* is a local boat trading between these points, and makes tri-weekly trips, carrying an average of 35 passengers and 90 tons of freight during the entire season of open navigation.

The *Katie Prather* makes daily trips to Manchester, Ohio, up-river, and carries on each trip an average of 15 passengers and 3½ tons of freight, consisting mostly of farm products and general merchandise.

The *Handy No.* 2 also plays a considerable part in the business of Maysville, running, as before described, between here and Portsmouth, Ohio. The local ferry to Ohio-shore points makes tri-daily trips and carries an average of 12 passengers with 4 tons of freights.

Another boat transacts a like business between Maysville and Augusta, Ky., several miles down the river, making two daily trips and averaging 24 passengers with 4 tons of freight each round trip.

Rates to Cincinnati by river are somewhat cheaper on the average than by rail, as the river route is more direct. The same may be said of passenger rates.

Between Maysville and Cincinnati there are no towns of special commercial importance on either side of the river. The various landings have a respectable local trade, which is centered at Cincinnati almost wholly.

NEWPORT, KY.

This city, of 27,000 population, is the seat of justice of Campbell County, Ky., and is situated on the Ohio opposite Cincinnati, at the mouth of the Licking River, and has large manufacturing and jobbing interests. The Cincinnati division of the Louisville and Nashville Railroad gives it excellent rail connections with the roads centering at Cincinnati and all the main lines traversing the State of Kentucky. Campbell County has 50,000 acres of improved lands, producing uniformly large crops of wheat and tobacco and an abundance of fruit. The Licking is the fourth in size of the navigable watercourses of the State, and a considerable quantity of timber is brought out of it at favorable stages of water, which finds a ready market at Newport, Covington, and Cincinnati. Its propinquity to Cincinnati and its intimate commercial relations to that city make Newport as well as the sister city of Covington quite suburban, although each community has its distinctive enterprises.

Newport is directly connected with Cincinnati by a fine railway bridge, owned by the Pittsburgh, Cincinnati and St. Louis Company, for a profile of which and a detailed description see another portion of this report. Over this bridge the Louisville and Nashville carried in 1884–'85 222,202 north-bound and 241,673 southbound passengers, besides 514,750 tons of northbound and 396,997 tons of southbound freights, for a classification of which tonnage see the special tables of railroad statistics published in another place.

No records are kept at Newport showing either the exact tonnage or commercial value of local freights received or shipped by rail or river, and the best approximation procurable from representatives of the leading industries of the city is presented in the following table, which of course is not complete and only given for what it is worth:

Commercial movements at Newport, Ky., for the year 1886.

Industries.	Establishments.	Capital.	Value merchandise received.				Value products shipped.			
			By rail.		By river.		By rail.		By river.	
			North.	South.	East.	West.	North.	South.	East.	West.
Agricultural implements	1	$42,000	$25,000	.....	$12,000	.....	.....	$15,000	$2,000	$12,000
Breweries	2	25,000	6,500	$2,500	.....	.....	.....	12,000	5,000	1,200

* Grain. † Pig iron.

No figures showing the amount or value of timber floated down the Licking to this place could be gathered, but it is certain that the aggregate is several million feet annually. Much of this is worked up in local mills and the remainder finds a market and manufacture along the Ohio shore at, above, and below Cincinnati. There are no regular boats navigating the Licking, and it is only at stages of high water that local vessels run up that stream to bring out what freight they can find. As a general rule, back-country freights are either wagoned to railroad lines or hauled down to the minor landings along the Ohio east of Newport. All this local trade is merged in the general aggregate of each class of transportation shown in other tables.

The volume of industrial products, less local competition, is fairly presented in the foregoing exhibit of commercial movements for Newport.

There are two ferry-boats running between Newport and Cincinnati, averaging each 120 round trips weekly, with a separate average of 6 passengers and 5 tons of miscellaneous freights per round trip. No regular line of steamers arrives at or departs from the local wharf unless charged with freights, the river business being almost wholly transacted on the Cincinnati side.

COVINGTON, KY.

This city, the seat of Kenton County, lies just below Newport, on the Ohio River, separated from it by the Licking, and has a population of about 35,000, mainly engaged in manufactures of different classes. The statistics of these leading industries, as nearly as could be gathered, are given in the table below. The county of Kenton is exceedingly fertile, and produces large crops of tobacco and cereals, which find a near-by market at Cincinnati. Three lines of railway penetrate the county and furnish Covington with ample facilities for transportation. These lines are the Kentucky Central, now operated by the Newport News and Mississippi Valley Company, the "Cincinnati Short Line," or the Cincinnati Division of the Louisville and Nashville system, and the Cincinnati, New Orleans and Texas Pacific main line, formerly known as the Cincinnati

Southern. Of the tonnage and passenger business north and south through Covington transacted by these roads exact statistics were procurable only from the Louisville and Nashville Company, figures of which are given in that part of this report relating to Newport, and also such general statistics as the Cincinnati, New Orleans and Texas Pacific could furnish of the freights and passengers carried across the Ohio over their bridge at this point. The latter figures and a description of this bridge will be found under the proper heads in a subsequent part of this report.

Commercial movements at Covington, Ky., for 1886.

* Pig iron. †Sugars.

The ferry business of this city is mostly with Cincinnati, and is limited by the street-car and vehicle traffic over the suspension bridge between the two cities. Only a single boat is required for this business, making twelve round trips daily, and averaging fifteen passengers and 10 tons of freight per round trip.

As stated concerning Newport, the regular up and down river traffic is handled almost wholly on the Cincinnati wharf-boats, and it is almost impossible to separate that portion belonging to Covington or Newport from the general aggregate of Cincinnati river tonnage.

THE CITY OF CINCINNATI.

This city, situated in latitude 39° 6′ 30″ north, and in longitude 84° 26′ west, is 458 miles below Pittsburgh and 500 miles above Cairo, or midway between the source and mouth of the Ohio River. The place was founded in 1788, and the first permanent settlers came during the following year, being New Jersey emigrants, who floated down the Ohio from Marietta, the then outpost of regularly organized settlement in the vast unexplored, and almost wholly unknown Northwest Territory. In 1800 the embryo city boasted of 750 inhabitants. In 1820 the population had grown to 9,602, and the introduction of steam transportation upon the great water-way of the Ohio gave Cincinnati an impulse that has led her up to metropolitan honors in population, commerce, literature, science, and art. In 1830 there were 24,830 people who called Cincinnati their home; in 1840 the number had nearly doubled, and the census enrolls 46,338; in 1850 the doubling process was exceeded, and her population had become 115,438; in 1860 this, too, had enlarged to 161,004 souls; in 1870 the swarm filling the old hive was 216,239, which, in 1880, grew to 255,139, and now nearly aggregates 300,000.

The city proper covers an area of 24 square miles, and occupies two riparian terraces north of the Ohio River; the lower terrace being 50 feet and the upper one 108 feet above river level. No city in the Union has finer public or private buildings, or a better sewerage system and water-supply. The network of railroads centering here, together with the fine facilities for river transportation of products and supplies for 2,000 miles through an inland market territory, combine to render the commercial advantages of Cincinnati unsurpassed in the great West. With cheap fuel and abundance of raw materials at her gates, and with the broadest sort of competition in the carriage of both these and her manufactured products, the future of the Queen City of the West will not remain a matter for idle conjecture.

In a community so large as this, where the diversity of interests is so unusually great, and the figures to be considered are so widely various by comparison from decade to decade, and even from year to year, it would be impracticable, in the compass of a report like this, to attempt anything like a minute history of the growth even of the leading enterprises of the city. Unlike Pittsburgh, whose larger industries are limited to a few departments, Cincinnati owns and promotes a thousand different industries, that are, at best, even difficult to classify properly under industrial heads, and the best satisfaction will be given by a perusal of official statistics.

It is a pleasure to be able to say, for one of the great cities along the Ohio River, at least, that a thorough and accurate system of commercial and industrial statistics is kept. Cincinnati has this, beyond the statistical records of any other city in the West or South, largely through the self-sacrificing devotion and trained intelligence of Col. Sidney D. Maxwell, superintendent of the Chamber of Commerce. These statistics, made annually under his supervision, are models of conciseness, comprehensiveness, and accuracy, and numerous obligations are owing by me in the preparation of this report to Colonel Maxwell's generosity and public spirit, and no better place offers than this connection for a suitable acknowledgment.

All the tables following that relate to the commerce of Cincinnati, except the special railroad statistics, are taken entirely from the annual reports of the Cincinnati Chamber of Commerce.

At this point on the river the statistical order will be: (1) General manufactures by periods; (2) manufactures existing in 1885; (3) lists of imports and exports, with values for a period of six years past; (4) destination and mode of shipment of principal commodities, for a series of years: (5) a series of tables showing the condition of river commerce, boat-building, etc., for a series of years as far back as accurate figures are attainable; (6) a condensed statement of the coal trade of Cincinnati for comparative purposes between river and rail routes, for a period of five years, and, finally, a description of the railroad facilities of Cincinnati coming into competition with the river.

This arrangement recommends itself as the only logical one in the premises, and needs no more extended introduction than the foregoing statement.

First, then, as to the growth of the city in point of

MANUFACTURES.

Upon this point a complete showing is made in the following table, covering decades and years between 1840 and 1886:

A classified and comparative statement of the value of products of the manufacturing industries of Cincinnati, for the years named below.

Classification.	1840.	1850.	1860.	1870.	1879.	1880.

It will be observed by this table that there has been a shrinkage of capital employed in manufactures as well as in the value of products for the year 1885, from the figures attained in either 1883 or 1884. This is due not, as might be inferred, to any diminution of the spirit that has built up these gigantic interests, but rather to the course of such business everywhere in this country during the past two years in its gravitation toward a plane of decidedly lower values for all classes of manufactured products. That this must be so is apparent in the present instance from the fact that while values have decreased, the number of individual establishments and the number of hands employed have been increased during 1885 beyond any previous figures.

The table next following exhibits the wonderful diversity of these manufacturing interests as they existed during 1885, and speaks volumes in favor of the progressive spirit of the business men of the Queen City.

Table showing the cash capital invested, the value of manufactured products, the number of hands employed, and the number of manufacturing establishments of the city of Cincinnati, for the year ending January 1, 1886.

Class of manufacture.	Number establishments.	Cash capital invested.	Number hands employed.	Value production.
Agricultural implements	5	$233,000	370	$392,500
Artificial limbs and trusses	10	41,000	61	81,314
Awnings and tents	11	26,350	103	98,200
Baking powder and yeast	11	93,000	95	264,000

[1] 8,849,928 gallons.
[2] 24 breweries, 7 bottling establishments. Malt liquors manufactured, 26,941,810 gallons.
[3] 9,666,184 gallons.
[4] Estimated.
[5] Last year's report.
[6] Book paper, 14,795,864 pounds; manilla, 20,157,663 pounds; news, 19,879,944 pounds; roofing, 5,280,000 pounds; wrapping, 18,468,793 pounds; writing, 2,441,300 pounds.
[7] Cigars, 84,317,000; cigarettes, 76,000.
[8] Number of establishments manufacturing plug-tobacco, 7; fine-cut, 4; smoking, 13; snuff, 6; quantity produced: plug-tobacco, 464,312½ pounds; fine-cut and smoking, 1,229,865¾ pounds; snuff, 18,605 pounds.

Table showing the cash capital invested, the value of manufactured products, the number of hands employed, and the number of manufacturing establishments of the city of Cincinnati, etc.—Continued.

Class of manufacture.	Number establishments.	Cash capital invested.	Number hands employed.	Value production.
Window shades, venetian shades, etc	7	$25,000	40	$35,160
Woolen and worsted goods	3	165,000	212	295,600
Wooden ware	16	155,000	300	375,000
Wood turning and carving	17	50,000	75	125,000
Miscellaneous industries	78	670,000	720	1,561,900
Miscellaneous industries of Hamilton County, outside of the city limits, not included in above[1]	.....	1,600,000	1,600	2,800,000
Total	5,946	76,248,200	93,103	190,722,153

[1] Estimated.

In contrast with this splendid showing, the figures of twenty-five years ago become insignificant.

It is estimated that, notwithstanding the depreciation of values still continues, the aggregate of manufactured products for Cincinnati during the current year ending January 1, 1888, will overtop even the high-water mark of products in 1884, when they exceeded a value of $200,250,000.

The specialties for which Cincinnati has made herself noted throughout the South and West, and in which lines she has no successful rival in any of the cities west of the Alleghanies, are boots and shoes, candles, soaps and oils, carriages and buggies, clothing and furnishing goods, fine furniture, distilled and rectified liquors, paper in all its forms of manufacture, safes and bank locks, stoves and hollow ware. In pork-packing the city for years held the front rank, and is now second only to Chicago in this industry.

COMMERCE OF CINCINNATI.

The best exposition of the comparative growth and magnitude of the city in a commercial way will be found in the following tables, showing the imports and exports with values of the same for a period of five commercial years commencing September 1 and ending August 31 of each year as specified:

Imports into Cincinnati for five years, commencing September 1 and ending August 31 of each year, with quantities of same.

[1] Supplemental reports embraced.

[2] Reported under the head of "Number."

[3] Prior to 1874–'75 the hog product was reported in packages, without regard to the kinds of meat. Since that time it has been reported in pounds, with a view of having each kind of product under its appropriate head (the bulk meats, loose, also embracing green meats), though, on account of the indefiniteness in this respect of the bills and books of transportation companies, it is difficult in many instances to arrive at exact facts as to the kinds of meat.

[4] Estimated. Embracing all ice sold for the Cincinnati market.

[5] Reported wholly in tons.

[6] Embracing also sales when the article was shipped directly from the place of manufacture or storage without stopping at Cincinnati.

[7] Reported under the head of "Tierces."

[8] Reported under the head of "Barrels."

Imports into Cincinnati for five years, commencing September 1 and ending August 31 of each year, with quantities of same—Continued.

[1] Supplemental reports embraced.

[2] Prior to 1874-'75 the hog product was reported in packages, without regard to the kinds of meat. Since that period it has been reported in pounds, with a view of having each kind of product appear under its appropriate head (the bulk meats embracing also green meats), though on account of the indefiniteness in this particular of the bills and books of transportation companies, it is difficult, in many instances, to arrive at exact facts as to the kinds of meat. The value of these articles prior to 1874-'75 remains under the old classification.

[3] Estimated. Embracing all ice sold for the Cincinnati market.

[4] Comprising also sales made at Cincinnati, when goods were shipped directly from the place of manufacture or storage, without the same stopping at this city.

[5] Including shingles.

[6] Not including receipts from Lockland and St. Bernard, which were embraced prior to 1877-'78.

Imports into Cincinnati for five years, commencing September 1 and ending August 31 of each year, with values of same—Continued.

* Embracing the total approximate shipment of goods manufactured in Cincinnati.

Besides these special evidences of the commercial wealth of Cincinnati, a table showing the valuation of real and personal property owned by her citizens, with a statement of the annual rate of taxation and revenues derived thereby, will serve to round up the statistical history of the city, and is in itself an epitome of municipal growth in a most important aspect. Such a table is given below, as furnished by J. W. Brewster, esq., auditor of Hamilton County, covering the years it has taken Cincinnati to attain to her present metropolitan proportions.

Valuation of real and personal property, rate of taxation, and amount of tax revenues of Cincinnati for the past fifty-six years, as specified.

Years.	Real estate.	Personalty.	Amount of levy.	Amount of revenue.
1831	$3,356,523	$1,363,057	1.20	$57,917
1832	3,717,785	1,620,924	1.31	72,666
1833	3,912,075	1,391,731	1.41	74,307
1834	3,972,000	1,355,990	1.42	79,131

With the foregoing facts, the subject of Cincinnati's position as a commercial city may be dismissed for a particular inquiry into the relations sustained by all this splendid business to the Ohio River, during these years, or as many of them as recorded statistics have covered upon this special point.

RIVER COMMERCE OF CINCINNATI.

The volume of imports and exports at Cincinnati, so far as the aggregate goes, has no statistical separation into such part as is transported by rail and such as is carried upon the river, and the only practical method to ascertain these proportions is indirect, and such as will be found in a table giving the destination and mode of shipment of the principal commodities exported from the city for several recent years. It is believed that the proportion of imports received by river, for nearly all this list of commodities mentioned in the table, will be more in favor of water transportation, but the percentage of difference would require long and laborious calculations to establish with any degree of certainty. As to one leading article of import—coal—the quantities received by the

two methods of transportation have been kept separate, and the figures will be furnished in a subsequent table. So far as the destination of exports or the sources from which imports were drawn, the railroads keep no record that can be appropriated to the uses of this report, beyond the mere direction in which their aggregate tonnage of freights is carried, and only a few of these roads are able, even if disposed, to make even such a partial showing. A cursory examination of the table following, however, will show an improvement in the volume of a majority of the commodities exported by river and a falling off in a majority of those transported from Cincinnati by rail. It must not be inferred from this recent fact, and it is only recent, that river commerce is recovering lost ground from the railroads. There are too many uncertain factors in the river traffic to enable this to be said with justice, and too many certain disadvantages, aside from industrial depressions and other incidents to which the railroads are subject equally with water routes, to permit such a statement to be made reliably. Take, for example, the present year's commerce by river, when the obstinate low stage of water in the Ohio has reduced river business to an almost unparalleled minimum. Consequently, in a very general way only can the table here given be regarded as furnishing a fair average basis for comparisons between river and rail transit.

Destination and mode of shipment of the principal commodities shipped from Cincinnati during five commercial years, with values of same.

[1] Supplemental reports included.

[2] Including chairs.

[3] Prior to 1874–'75 the hog product was reported in packages, without regard to the kinds of meat. Since that period it has been reported in pounds, with a view to having each kind of product under its appropriate head. On account, however, of the indefiniteness of the bills and records of transportation companies, it is difficult in many instances to reach precise statistics as to kinds of meat. The value of these articles prior to 1874–'75 remains under the old classification.

[4] Embracing also sales made at Cincinnati where goods were shipped directly from the place of manufacture or storage, without the same stopping in this city.

[5] Not including petroleum, which was embraced prior to 1881–'82.

Destination, etc., of the principal commodities shipped from Cincinnati, etc.—Continued.

TOTAL VALUE BY YEARS, IN DOLLARS--Continued.

[1] Included in "oil," prior to 1881-'82.
[2] Embracing also sales made at Cincinnati where goods were shipped directly from the place of manufacture or storage, without the stopping in this city.
[3] Supplemental reports included.

This table shows that of the commodities named 43 have their principal distribution at up-river ports, 39 at down-river ports, and that 16 are about evenly divided as to destination. What is rather an anomaly, so far as the current opinion runs, is the fact that the greater proportion of hog products shipped from Cincinnati by water finds an up-river market; but this class of supplies goes to feed the great army of laborers in the mines, salt works, and oil and lumber regions of West Virginia, instead of being drawn southward, as was formerly the case. The railroads, however, continue to carry immense stores of this kind to the leading cities south and west of the Mississippi, and this enables Cincinnati to remain a good second on the list of pork-packing centers of the country.

To supplement the figures just given, the following table, showing the monthly receipts by river of the leading commodities at Cincinnati for five commercial years, will serve to close the only gap in this subject that can be filled by recorded facts:

Monthly receipts, by river, at Cincinnati, of various leading commodities, in five commercial years.

Months.	Apples.	Cattle.	Corn.	Cotton.	Flour.	Hogs.	Iron, manufactured.	Iron, pig.	Molasses.	Nails.	Oil.

The exhibits here made of Cincinnati's river trade naturally introduce the specific means of transportation. Upon this point there is fortunately an abundance of statistics ready prepared to show the condition of steam-boating at this port for a considerable period.

In the first place, it is best to notice the fact that the boat-building industry has been waning for several years past, doubtless keeping pace with a general reduction in that business all along the river. The table here given will show the ups and downs of this branch of manufacture for thirty-nine years past, and point a moral for all river business, languishing for want of the Government's fostering aid:

Whole number, with the tonnage, of steam-boats and barges built at the port of Cincinnati for each of the last thirty-nine years.

Years.	Number.	Tonnage.	Years.	Number.	Tonnage.	Years.	Number.	Tonnage.
1847–'48	29	10,233	1860–'61	11	3,327	1873–'74	15	3,789
1848–'49	23	7,281	1861–'62	4	1,745	1874–'75	6	2,741
1849–'50	16	4,500	1862–'63	43	12,590	1875–'76	9	2,961
1850–'51	31	8,206	1863–'64	62	20,117	1876–'77	14	4,434
1851–'52	33	8,896	1864–'65	44	10,878	1877–'78	22	6,704
1852–'53	29	10,252	1865–'66	33	9,405	1878–'79	15	7,642
1853–'54	31	9,858	1866–'67	18	6,734	1879–'80	16	5,970
1854–'55	27	8,698	1867–'68	11	5,136	1880–'81	15	11,236
1855–'56	33	11,356	1868–'69	11	4,224	1881–'82	13	5,499
1856–'57	34	10,600	1869–'70	34	13,570	1882–'83	12	4,957
1857–'58	14	5,334	1870–'71	25	12,758	1883–'84	4	1,288
1858–'59	11	3,735	1871–'72	20	7,761	1884–'85	3	1,037
1859–'60	28	6,113	1872–'73	25	8,124	1885–'86	.....	.....

The past commercial year (1885–'86) does not record a single boat or barge as constructed in this city.

The port record shows the following total number of arrivals and departures of steamboats at Cincinnati for each of thirty years past:

Total number of arrivals and departures of steam-boats at the port of Cincinnati for thirty years.

Years.	Arrivals.	Departures.	Years.	Arrivals.	Departures.	Years.	Arrivals.	Departures.
1856–'57	2,702	2,648	1866–'67	2,853	2,838	1876–'77	2,646	2,653

The year 1886–'87 will fall below the lowest previous record by reason of the continuous low water that prevailed.

In this connection, the table showing the whole number of steam-boats (including tow-boats) which ran between Cincinnati and other ports during each of the last thirty-six years, with their aggregate annual tonnage, will contribute to throw light upon the subject under discussion. The following is the table referred to:

Whole number of steam-boats (including tow-boats) which ran between Cincinnati and other ports, during each of the years mentioned below, with the tonnage of the same.

Years.	Number.	Tonnage, underwriters' measurement.*	Tonnage, Government measurement.*	Years.	Number.	Tonnage, underwriters' measurement.*	Tonnage, Government measurement.*

1863–'64	359	81,609	.....	1881–'82	214	.....	78,793
1864–'65	359	78,416	.....	1882–'83	217	.....	75,344
1865–'66	318	68,181	.....	1883–'84	198	.....	68,312
1866–'67	278	64,555	.....	1884–'85	205	.....	65,261
1867–'68	257	60,618	.....	1885–'86	196	.....	63,998

*In order to have the figures conform to those of the Government, the figures were revised in 1881–'82, so as to embrace the Government measurement, instead of the underwriters', from the year 1868–'69, which was as far back as the revision could go with the means then at hand. (Report Cincinnati Chamber of Commerce.)

Thus the fact of the decline of steam-boating on the Ohio is emphasized anew by the figures of this table. In the commercial year of 1885–'86 the number of boats plying between this and other ports had fallen to the lowest place but one on the record of thirty-six years and to the seventh from the lowest place in tonnage. This has all the more significance when it is remembered that the city of Cincinnati gives and receives more general merchandise freights to maintain river commerce than any other city along the whole course of the Ohio, and that her middle position on the river from source to mouth is a commanding one naturally, enabling her to cultivate trade relations with the country up and down the entire river. So that what is true of the river commerce of this city, thus favorably located, must be none the less applicable to other riparian cities having fewer natural advantages and much less wealth invested in commercial business.

The table last above given represents the local trade-bottoms of the port. The distribution of the movements of the entire fleet of boats arriving at and leaving Cincinnati during seven recent commercial years is thus recorded:

Steam-boat arrivals and departures at the port of Cincinnati, classified, for seven years, ending August 31 each year.

Years.	Arrived from—				Departed for—			
	New Orleans.	Pittsburgh.	Other ports.	Total.	New Orleans.	Pittsburgh.	Other ports.	Total.
1879–'80	103	182	2,878	3,163	116	177	2,874	3,167
1880–'81	86	164	2,388	2,638	90	164	2,379	2,633
1881–'82	68	169	2,499	2,736	79	164	2,496	2,739
1882–'83	94	147	2,099	2,340	95	143	2,091	2,329
1883–'84	63	114	1,993	2,170	70	111	1,981	2,162
1884–'85	49	83	2,005	2,137	55	87	1,996	2,138
1885–'86	63	103	2,323	2,489	66	103	2,314	2,483

The last year's operations show a considerable increase of movements up and down river from this port; but, taken as a whole, the record is scarcely encouraging to river men.

Whole number of steam-boats (including tow-boats) which ran between the port of Cincinnati and other ports each of the last thirty-six years, with the tonnage of the same.

RAILWAY FACILITIES.

In respect to rail communications with all sections of the country, no city in the Union is better equipped than Cincinnati. There are in active operation and competition for business four lines running northward, tapping all the great roads in Ohio extending from east to west, and furnishing an outlet to Lake Erie. These roads are the Cincinnati, Hamilton, and Dayton; the Little Miami; the Ohio division of the Indiana, Bloomington and Western, and the Cincinnati Northern. To the south, three great systems have their northern termini at Cincinnati, namely: The Louisville and Nashville; the Cincinnati Southern, and the Kentucky Central division of the Newport News and Mississippi Valley Company. These southern lines cover the entire commercial field of the Southeastern and Southwestern States. The West is reached by the Ohio and Mississippi and the Cincinnati, Indianapolis, Saint Louis, and Chicago lines. The Eastern roads tributary to Cincinnati are the Cincinnati, Washington and Baltimore, connecting at Parkersburgh, W. Va., with the Baltimore and Ohio system; the Cincinnati and Eastern, recently changed to standard gauge, extending up the river to Petersburgh, Ohio, where connection is made by ferry with the Newport News and Mississippi Valley Railroad's main line, and the Maysville and Big Sandy extension of the latter road, running along the south bank of the river from Ashland, Ky., to Cincinnati, now about completed, and for some time in partial operation.

Statistics of the cross-river business of such of these lines as have that sort of relation to this report will be found in a subsequent section.

Upon the subject of comparative rates by rail and river to various leading and competitive points, the best elucidation attainable from records is presented in the following table:

Average monthly schedule rates of freight on flour, per barrel, by rail and river, from Cincinnati to various leading points, for five calendar years, expressed in cents.

Dates.	Atlanta (rail)	Baltimore (rail).	Boston (rail).	Charleston (rail).	Chattanooga (rail).	Louisville.		Memphis (river).	Mobile (rail).	Montgomery (rail).	New Orleans.		New York (rail).	Pittsburgh.		Savannah (rail).

*The disturbance of rates was too frequent to permit anything like a fair estimate of averages.

It is generally conceded among business men at this point that the river has served a most valuable part in keeping down rates to all points where there is rail competition, especially in the case of bulky freights. At times when navigation has been suspended by ice the railroads have advanced rates to such points, only to be compelled to make reductions when traffic by river was resumed. In every instance where rates by rail have been broken by "rate wars" among the roads the river lines have met the break with less injury than that suffered by the land lines.

THE COAL TRADE.

This business, which ranks among the chief ones of Cincinnati, may be appropriately discussed at this stage, because it affords a fine subject for comparison between the trade by river and rail upon the single item which constitutes very much the largest part of the entire tonnage carried by river between Pittsburgh and Cairo, and for the reason that only at Cincinnati are to be found anything like adequate statistics.

During the past thirty-three years the receipts of coal of all kinds at Cincinnati have been as follows:

Annual receipts of coal at Cincinnati for thirty-three years.

Years.	Bushels.	Reduced to tons.	Years.	Bushels.	Reduced to tons.
1853-'54	8,158,000	302,148	1870-'71	22,972,000	850,814
1854-'55	10,356,000	383,555	1871-'72	30,790,796	1,140,399
1855-'56	7,500,000	277,777	1872-'73	37,274,497	1,010,018
1856-'57	14,500,000	537,037	1873-'74	35,234,834	1,305,285
1857-'58	15,000,000	555,555	1874-'75	35,390,300	1,311,488
1858-'59	12,392,701	458,988	1875-'76	40,183,317	1,489,108
1859-'60	14,600,000	540,740	1876-'77	39,622,634	1,468,619
1860-'61	12,500,000	462,492	1877-'78	38,892,229	1,441,754
1861-'62	8,500,000	314,814	1878-'79	34,210,667	1,269,339
1862-'63	8,000,000	296,296	1879-'80	48,198,246	1,787,230
1863-'64	15,975,366	591,680	1880-'81	40,244,438	1,492,817
1864-'65	16,467,023	609,889	1881-'82	59,267,620	2,197,407
1865-'66	18,022,900	667,514	1882-'83	54,620,032	2,025,859
1866-'67	18,446,226	683,195	1883-'84	56,412,059	2,092,551
1867-'68	17,500,000	648,148	1884-'85	54,138,322	2,008,850
1868-'69	25,500,000	944,444	1885-'86	57,416,529	2,130,354
1869-'70	30,300,000	1,222,222			

Separation between these receipts by rail and river has not been made on the commercial records of the city until recently, and figures are given below for seven commercial years.

Receipts of coal at Cincinnati by rail and river for years named.

Years.	By rail.		By river.	
	Bushels.	*Tons.*	*Bushels.*	*Tons.*
1879-'80	3,276,460	123,460	44,921,786	1,663,769
1880-'81	3,160,414	119,335	37,084,024	1,373,482
1881-'82	4,105,672	154,573	55,161,948	2,043,034
1882-'83	3,979,515	147,389	50,640,517	1,875,574
1883-'84	4,996,145	188,258	51,415,914	1,904,293
1884-'85	4,064,830	154,277	50,073,492	1,854,573
1885-'86	4,008,175	152,267	53,408,354	1,978,087

The different sources of supply for these coal receipts, with the quantities by years from each, for the same period, are as follows:

Years.	Pittsburgh.	Kanawha.	Ohio River.	Other sources.	Anthracite region.	Total.
	Tons.	*Tons.*	*Tons.*	*Tons.*	*Tons.*	*Tons.*
1879-'80	1,175,962	337,603	158,082	87,100	28,482	1,787,229
1880-'81	859,336	399,376	116,738	86,546	30,821	1,492,817
1881-'82	1,400,295	519,560	138,749	107,606	31,197	2,197,407
1882-'83	1,255,373	500,987	122,575	107,834	39,090	2,025,859
1883-'84	1,194,054	586,535	109,507	159,041	43,414	2,092,551
1884-'85	1,195,783	542,152	111,373	109,226	50,316	2,008,850
1885-'86	1,293,835	649,447	34,805	100,750	51,517	2,130,354

By subtracting the total annual receipts of coal from the Pittsburgh region, recorded as above, from the total annual bushels shipped from the pools of the Monongahela Slackwater at Pittsburgh, as shown by the statement accompanying the pages descriptive of the commerce of that city, the remainder will show the percentage of the consumption of that class of coal at points between Cincinnati and Pittsburgh and at points below Cincinnati. For example: The total output of the pools for 1886 was 109,895,147 bushels. The receipts of Pittsburgh coal at Cincinnati for that commercial year were, by river, 34,933,542 bushels. This would leave for the supply of other river points and for consumption at Pittsburgh 74,961,605 bushels. Natural gas having almost entirely superseded the use of coal for manufacturing and domestic purposes in Pittsburgh, the above may be regarded, practically, as the surplus supply for all other points outside of Cincinnati.

But it is as furnishing a basis for percentages between rail and river tonnage that these figures here possess their main value.

Of the total receipts of coal from all points at Cincinnati during the seven commercial years selected for comparison, the following percentages exist between rail and river tonnage:

Year.	Percentage—	
	River.	Rail.
1879–'80	93.20	6.80
1880–'81	92.10	7.90
1881–'82	93.00	7.00
1882–'83	92.70	7.30
1883–'84	91.20	8.80
1884–'85	92.50	7.50
1885–'86	93.00	7.00

Superintendent Maxwell, of the Cincinnati Chamber of Commerce, speaking of the coal trade in 1884–'85, says:

"In speaking of the river interests in our time, when rapid transit largely determines the matter of travel and of a great number of articles of freight traffic, it is possible, unintentionally, to do injustice to the river in measuring the relation which it now sustains to the earlier periods of steam-boating. Thus men speak of the decadence of the traffic by steam-boats, and there can be no doubt that the multiplication of railways and the improvement of their service have in an important manner changed the character of the business of the river, and yet with all this it is demonstrable that the quantity of coal now brought to this city by river is wellnigh double the entire receipts of freight by the steam-boats which conducted the business of Cincinnati in the days when steam-boating on the Western waters was recognized as being in its prime. In verification of this it may be stated that the total number of arrivals during the thirteen years prior to the war, which embrace the period when the largest number of boats was employed, was 43,820, making an annual average of 3,370 arrivals. This would make an average annual tonnage of 849,240 tons. If 33 per cent. were added to this for increased carrying capacity over the measurement, it would exhibit an annual tonnage capacity of 1,132,320. Now, it thus appears that the receipts of coal alone at Cincinnati by river in 1884–'85 exceeded this entire carrying capacity by 722,253 tons, and yet these figures for the earlier years, it must be kept in mind, represent the total capacity of the boats, which, of course, in making comparisons with the coal actually transported, must be much in excess of the actual freights brought to this city—a statement which furnishes an argument to which our legislators should lend a listening ear whenever it is sought in any way to impair the facilities for our river commerce."

It is to be regretted that no comparative records of coal shipments by rail and river are kept at Cincinnati, since such figures would complete the discussion of this branch of the subject.

The port list shows 59 freight and passenger boats (including ferries and harbor vessels) which plied between Cincinnati and other ports during the years 1885–'86. These boats had a total tonnage of 31,112.29, and full particulars concerning their trips and business will be found in the general table of Ohio River commerce.

LIVE-STOCK MARKET.

CINCINNATI, *October* 3, 1887.

To the members of the Pork Packers' Association of Cincinnati:

GENTLEMEN: The past year, to the general business of the country, brought a fulfillment of the promises which the conditions seemed to make at the close of the previous year. In all branches of business increased activity has been witnessed. Trade, manufactures, and transportation have alike felt the stimulation of improved times. In this better condition the provision interest has found participation, and the members of this association may well be congratulated upon the enjoyment of a year's business which has brought to them reasonable returns for capital and labor employed. While hogs cost more than in the season of 1885–'86, they were still purchased at low prices, and the generally upward tendency to the cured product brought possibilities to the trade which were forbidden by the untoward events which, with little exception, crowded the four preceding years. Little change has occurred in the extent of the packing industry of this city, and in the very nature of the case little can be expected. The number of hogs packed in the West showed some increase, but what was gained in number was more than lost in diminished weight, so that with the number packed in the summer varying little from the preceding year no important change is to be noted in the aggregate physical results of the year, the shipments of the product to foreign countries having somewhat declined.

The business in live-stock at this city has, in the aggregate, been well maintained compared with 1885–'86. A larger business has been transacted in hogs. Little change has occurred in cattle and sheep. The receipts of sheep show a considerable reduction at the yards, but this is entirely traceable to a less number having been duplicated by shipment from one yard to the other, the actual receipts at this point having slightly increased. The year has been mainly satisfactory to shippers, except as to cattle, in which the business has not been so favorable as in former years. There, however, has been a good demand for stock, and in general the yards have done a fairly remunerative year's work. The quality of stock in the later months, because of the dry weather which generally prevailed and the damage done to pasturage, was more or less impaired. The general average of cattle for the year, however, was extraordinarily large, having in nine months of the period exceeded 1,000 pounds, a thing unprecedented in the history of the Union Yards, the averages for both hogs and sheep having generally throughout the year fallen below 1885–'86.

According to reports submitted by William J. Lippincott, esq., president of the Cincinnati Union Stock-Yards Company; W. A. Peter, esq., superintendent of the Covington Stock-Yards; George Slimer, esq., of Slimer's Stock-Yards, and M. T. Hoshal, esq., manager of Eggleston Avenue Stock-Yards, the receipts of live-stock (not including horses and calves) at the yards in this city, in two years, each year ending August 31, were distributed as follows:

	Hogs.		Cattle.		Sheep.	
	1886–'87.	1885–'86.	1886–'87.	1885–'86.	1886–'87.	1885–'86.
Cincinnati Union	666,444	631,695	152,607	161,479	409,972	469,629
Covington	96,921	95,322	40,780	38,493	170,701	180,123
Slimer's	55,550	50,378	6,410	6,572	19,259	22,031
Eggleston Avenue	36,797	36,174	331	388	2,573	1,380
Total	885,712	813,569	200,128	206,932	602,505	673,163

The receipts of the three kinds of stock aggregated 1,658,345 head in comparison with 1,693,664 in 1885–'86. These figures, because of duplication at the yards growing out of interchange, while showing the business of the yards, are in excess of the actual movement; the actual receipts at this city in the past year having been as follows:

	1886–'87.	1885–'86.
Hogs	835,247	779,956
Cattle	186,110	199,344
Sheep	566,921	565,262
Total	1,588,278	1,544,562

This shows an increase in the three kinds of stock of 43,716 head; the preceding year also having exhibited an increase over 1884–'85.

The shipments from the city in the past year aggregated:

	1886–'87.	1885–'86.
Hogs	279,400	215,025
Cattle	60,611	71,606
Sheep	426,052	382,983

Of these there were shipped from the Union Yards:

	1886–'87.	1885–'86.
Hogs	224,901	182,085
Cattle	35,716	50,755
Sheep	293,401	348,891

The net receipts were as follows:

	1886–'87.	1885–'86.	1884–'85.
Hogs	555,847	564,931	566,052
Cattle	135,499	127,738	111,562
Sheep	140,869	182,279	167,154

These figures indicate very little change in the local consumption of cattle compared with the previous year, but exhibit a marked increase over 1884–'85, while sheep show a large falling off.

The weight of the stock received, as shown by such as were weighed at the Union Yards, which fairly represents the whole business, exhibits an increase in cattle of 20.52 pounds and a reduction in hogs of 10.03 pounds and in sheep of 2.11 pounds per head, the average gross weight of cattle having been 1,000.56 pounds, in comparison with 980.04 in 1885–'86; of hogs, 229.14 pounds, compared with 239.17 in 1885–'86, the average of hogs having been the lowest in the fourteen years in which the averages have been preserved, excepting in 1883–'84, when it was 228.10, and of sheep, 76.07 pounds, in comparison with 78.18, this average also having been the lowest in fourteen years, with the exception of 1877–'78, when it was 75.98.

While in late years there has not appeared to be frequent use for the association, there are times when it is desirable that there should be an organized body to give expression to the opinions and the wants of a body of manufacturers and merchants sustaining a relation so important to the business interests of the city as do the members of this association. This was demonstrated only a few years ago in the matter of taxation, and finds emphasis now, when the association is called upon to consider the subject of lard adulteration, and of invoking legislation for the protection of legitimate production.

Respectfully submitted in behalf of the board of directors.

SIDNEY D. MAXWELL, *Secretary.*

LAWRENCEBURGH, IND.

The first place of importance on the river below Cincinnati is Lawrenceburgh, the seat of Dearborn County, Indiana, 22 miles from Cincinnati. In 1880 the town had 4,668 inhabitants, and now claims a population of twice that number, and probably has about 8,000. It is one of the oldest settlements on the Indiana side of the river, and for years enjoyed a lucrative pork trade in common with other cities lower down, but of late that interest has largely decayed. Its present business consists principally in the manufacture of furniture, burial cases, and cooperage. At the close of the war there was a large distillery located here, but this has been practically suspended for several years. The existing manufacturing interests are as follows:

Flouring mills, 2; capital, $75,000; value of annual product, about $125,000. Furniture factories, 3; capital, $250,000; value of annual product, $400,000. Burial-case manufactory, 1; capital, $85,000; value of product, $125,000. Cooperage works, 1, capital, $250,000; value of output, $300,000. The capital stock of the last-named establishment is mostly owned in Cincinnati.

Lawrenceburgh has no special river trade, and no local boats are run in her interest which carry general freights and passengers. The railroad connections are by the Ohio and Mississippi, and Cincinnati, Indianapolis, Saint Louis and Chicago roads to Cincinnati, and the same lines to the West and Northwest.

The principal markets for her manufactures are Cincinnati and Western cities, and her general supplies are drawn from Cincinnati, being shipped in almost entirely by rail. No commercial statistics are kept here.

AURORA, IND.

This thriving little city of 8,000 population is located on the river 4 miles below Lawrenceburgh, and has several lines of manufacture, including distilled and malt liquors, chairs, and light machinery. The principal receiving and shipping trade is carried over the Ohio and Mississippi Railroad, the former coming from Cincinnati and the latter extending over the Southern and Western States. The aggregate capital employed in manufactures is about $1,250,000, and the annual products average $2,000,000 in value. The trade by river is inconsiderable compared with that transacted by rail, and no statistics were procurable as to relative volumes.

There are no local boats plying here, and only the regular packet line between Louisville and Cincinnati makes stated landings for freights and passengers.

CARROLLTON, KY.

This place owes its chief importance to its location at the mouth of the Kentucky River, and although having only about 3,000 population, it enjoys a large trade in the products brought down that stream. It is the seat of Carroll County, one of the richest agricultural sections of the State. Corn, tobacco, hay, and potatoes are the leading local products, and these are supplemented by live-stock, timber, whisky, etc., from the up-river counties. All the regular packet lines make landings at Carrollton and receive and discharge large quantities of general freights.

The Kentucky River is the second in size in the State and the first in importance of her streams. By a small expense in slackwater improvements, with its three forks, it can be made navigable to steamers of 300 tons burden for a distance of 400 miles, 100 miles of which passes through a continuation of the great coal and iron fields along the western shed of the Cumberland Mountains.

At present there are two regular boats running between Louisville and Carrollton and up the Kentucky River to Frankfort, the capital city. These boats each make tri-weekly trips, and average 46½ tons of general freights to the round trip. For particulars see the general table showing the commerce of the Ohio River. In addition to these, the Louisville and Cincinnati packets touch here, and also a small packet making tri-weekly trips between Madison, Ind., on the Ohio, below Carrollton, to Vevay, Ind., above. No statistics of the local trade are prepared here, but the annual transactions will average about $3,000,000. The principal markets of supply and sale are Cincinnati and Louisville, with the distribution about equally divided between them. There is no railroad competition here.

MADISON, IND.

This city of 12,000 inhabitants, situated on the river 87 miles below Cincinnati and 45 miles above Louisville, is the most important commercial point between those cities. It was settled while Indiana was yet a Territory, and early became a center of trade for a large area of country adjacent on both sides of the river. For a lengthy period its leading industry was pork-packing, in which business the foundations of numerous individual fortunes were laid. When this business declined it was succeeded by the manufacture of starch, in which the factories of Madison were pioneers for the entire Western country. The city is the seat of Jefferson County, Indiana, and has the honor of being made the southern terminus of the first railroad built west of the Alleghany Mountains. This road, now known as the Jeffersonville, Madison and Indianapolis, and operated under a lease to the Pittsburgh, Cincinnati and Saint Louis Railway Company, has been continuously in operation since its construction, and has proved of incalculable benefit in promoting the early settlement of the State, as well as contributing greatly to the prosperity of Madison. This line gives an outlet to the North, East, and West by its connections at North Vernon with the Ohio and Mississippi road, and at Indianapolis with the roads diverging thence.

Madison's principal industries at the present time are as follows:

Industries.	No. establishments.	Capital invested.	Value of products.
Agricultural implements	2	$150,000	$225,000
Brewery	1	300,000	500,000
Boat-building	1	75,000	125,000
Flouring mills	2	80,000	100,000
Foundery, etc	1	25,000	75,000
Pork-packing	1	45,000	50,000
Starch works	3	250,000	425,000
Woolen mill	1	300,000	650,000
Miscellaneous	15	750,000	1,250,000
Total	27	1,975,000	3,400,000

The retail trade of the city will probably amount to as much as the value of manufactured products. Supplies for all are drawn from so many different sources that it is too difficult to specify them. The receipts are divided into two-thirds by rail and one-third by river, while the shipments average about half and half. There are no statistics here of any particular detail upon this point, and the above division depends for any value it may possess upon the estimates of leading business men of the city.

The boat-building industry, once of leading importance here, has dwindled to insignificant proportions, and the work now is generally confined to repairs and the construction of an occasional vessel under 50 tons measurement.

The local river lines comprise two boats: one running between Louisville and Madison, making daily trips, and averaging 40 passengers and 49 tons of general freight per round trip, and the other, a small boat, previously referred to, making tri-weekly trips between Madison and Vevay, carrying an average of 15 passengers and 9 tons of merchandise per round trip.

There is also a ferry-boat here, running across to the Kentucky shore, which makes four daily round trips, and averages 5 passengers and 1 ton of freight to the round trip. For further particulars see the general schedule of boats and commerce of the Ohio River.

JEFFERSONVILLE, IND.

This city of 13,000 inhabitants, the county seat of Clark County, Indiana, is located opposite to Louisville, with which it is connected by rail over the Louisville bridge, and by a prosperous ferry line, and is laid out upon a level plateau or the first alluvial bench, a few hundred yards above the head of the falls. It was first settled by people who had become dissatisfied with the official management of affairs in Louisville, about the year 1783, but the rapid influx of immigration to the fertile territory ceded by Virginia and the subjugation of the hostile red men under the vigorous campaigning of General George Rogers Clark soon gave the embryo town an impulse which threatened for a time to eclipse its older rival across the river in the race for wealth and population. The admission of Kentucky to the Union in 1792, however, gave Louisville an advantage that could not be overcome. From the latter date the growth of Jeffersonville has been unusually slow, but substantial, withal, and the access of important manufacturing enterprises, however much some of them have languished and become extinct since the disastrous commercial year of 1873, has given the community a leading position among the cities on the Indiana shore of the river.

For nearly a quarter of a century this city has been the chief boat-building point for the entire length of the river, and nearly all of the larger steamers that have plowed the Western waters were constructed here. This industry survives, although much reduced in volume by the inroads made upon river commerce by the multiplying lines of railroad, and every year there are some first-class vessels constructed here for the lower river and Mississippi trade. During a period of ten years, there was also a very considerable manufactory of polished plate-glass operated here with varying success; but, like other concerns of a similar character, it yielded at last to competition and general business depression.

The only details of the business done here in past years that can be depended on are those given below, and taken from a report made by D. M. Dryden, esq., of Jeffersonville, to Maj. Milnor B. Roberts, and published in the latter's report to the Secretary of War on the survey and improvement of the Ohio River.

Exhibit of the trade of Jeffersonville.

The present industries of the city are carefully estimated for the commercial year ended July 1, 1887, as follows:

Industries.	No.	Hands employed.	Capital.	Value of products.
Boat-building.....	1	325	$1,500,000	$2,000,000
Boots and shoes *.....	1	55	75,000	85,000
Bent-wood works.....	1	22	15,000	25,000
Breweries.....	1	10	15,000	25,000
Car works.....	1	2,500	750,000	900,000
Cement mills.....	1	30	50,000	60,000
Cigar manufactories.....	3	35	10,000	30,000
Cooperage.....	2	200	150,000	325,000
Flouring mills.....	3	30	125,000	250,000
Foundries, etc.....	2	250	375,000	600,000
Hardware *.....	1	565	400,000	800,000
Ice.....	2	15	50,000	95,000
Saddle-tree manufactories *.....	1	45	50,000	80,000
Saw mills.....	1	15	20,000	35,000
Tanneries.....	1	8	12,000	20,000
United States quartermaster's depot, United States Army †	1	169	3,500,000	600,000

* Industries carried on by convict labor in Southern Indiana prison.

† The largest depot in the United States, manufacturing all sorts of army stores except arms and ammunition. The labor is done by contract, principally in the cities of Louisville, Jeffersonville, and New Albany.

The wholesale trade here amounts to about $1,000,000 annually, while the retail trade is nearly twice that sum. No statistics were procurable as to the distribution of trade or sources of supply, nor was it practicable to ascertain the proportion of commerce carried on by river and rail separately. It may be stated that the flat-boat traffic, once very considerable, has dwindled to nearly nothing, and what is done in that line is drawn to Louisville as the leading market.

As closely as the figures could be procured, the status of the boat-building interest here for seven years past is as follows:

Years.	No. hulls built.	Tonnage.	Years.	No. hulls built.	Tonnage.
1886	13	6,500	1882	23	11,500
1885	10	5,000	1881	15	8,500
1884	7	2,800	1880	13	6,500
1883	27	7,100			

As at Cincinnati in the case of the cities of Covington and Newport, so here in the case of Jeffersonville and Louisville, the course of river trade is toward the larger city, and the regular packet lines barely touch at Jeffersonville, and transact almost all their business up and down river at the Louisville landing.

The ferry business between the two cities is and always has been quite large. This business is cared for by three handsome vessels, two of which are in constant service, averaging seventy round trips each, weekly, and carrying an average of 15 passengers and 5 tons of freight in wagons each per round trip. Further particulars of this business will be found in the general table showing Ohio River commerce. There are no local lines operated here outside of the ferry.

LOUISVILLE, KY.

The actual business life of this city began in the spring of 1780, when the infant settlement had a population of 600. The Virginia legislature at that date ordered a new survey, plat, and sale of lots under "an act for establishing the town of Louisville at the falls of the Ohio." This act further confiscated the 4,000 acres of land extending from Beargrass Creek to the foot of the falls, previously granted by Lord Dunmore, the then royal governor of Virginia, by deed to John Campbell and Dr. John Connally; the act of confiscation being prompted by the suspicion that Campbell and Connally were tories during the Revolutionary period. The plat thus ordered to be made is not now extant, and the oldest one at present in the city archives was drawn in 1812.

The navigation of the Ohio, up to 1776, had been wholly down-stream, the vessels employed consisting of bateaus, flat-boats, and similar frail craft; but, in the year named, a keel-boat passed up the falls at Louisville, from New Orleans to Fort Pitt (the original site of Pittsburgh), with a small cargo of gunpowder. This was the inauguration of up-stream navigation and the first proof that a loaded vessel could be made to ascend the falls at this point, and from that laborious voyage, long in advance of steam appliances, grew the enormous commerce of the Western rivers. It was likewise a godsend to Louisville, providing employment for much of its hardy pioneer population, and, later on, causing the Government to undertake and carry out wise plans of river improvement which have resulted in overcoming the formidable dangers to navigation at this natural barrier by means of a canal around the falls. In 1782 the garrison stationed here to protect the settlement from Indian depredations, erected Fort Nelson, on ground now lying between Sixth and Eighth streets, north of Main. For many years the guns of this stronghold commanded all approaches to the town by land or water, and it proved a formidable agent in keeping the red men quiet and in opening up the country along both banks of the river.

Up to this time, owing to the oppressive and unwise administration of affairs by the town trustees, the progress of Louisville was very slow in a material way, and some of the original settlers actually removed to the Indiana shore and established the village of Jeffersonville, which, notwithstanding its less advantageous location, for a time bade fair to outstrip its elder rival. The recent close of the Revolutionary war, however, with the discharge from military duty and British prisons of large numbers of daring and adventurous spirits, brought to the falls a new element, and a decided access of population and business. Schools, factories, and courts were soon put into brisk operation and commerce along the river received a new impetus. Urged by these foreshadowings of greatness, the people had grown weary of the domination of Virginia, and in 1785 petitioned for a separate State government. This was conceded finally in 1792, and

Kentucky became the first-born among the family of States. Now began in earnest the career of Louisville. A new board of trustees was chosen; a code of municipal law adopted, and the town began a substantial and steady growth which has continued to the present. The first check occurred in 1781–1795, occasioned by the embargo laid by Spain upon the navigation of the Mississippi, by the complications consequent therefrom, and the constant strain of menace and jeopardy to which river commerce was subjected during this period. When these difficulties were removed by treaty with Napoleon in 1795, and the Mississippi and New Orleans became a part of the United States, the watery highway was opened again, and Louisville hastened to make herself mistress of the Ohio River and its trade, and the acquisition of the Louisiana country may be regarded as the date and origin of her commercial greatness.

In 1810 the population had swelled to over 1,300, and in October of the following year the first steam-boat that ever plowed the Ohio was launched at Pittsburgh, and, after a three days' voyage, reached Louisville en route to New Orleans. In 1814 the town of Portland, west of Louisville, just below the falls, was laid out and a settlement begun. This year saw the first paper-mill erected on the Ohio at Louisville, and also the foundation of the new town of New Albany, on the Indiana side of the river, opposite to Portland. In 1815 Louisville boasted 122 factories and stores, 1 church, a theater, and 2 newspapers, and on July 3d launched her first home-built steam-boat, the *Governor Shelby*, of 122 tons burden, designed for the New Orleans and Louisville trade.

In 1820 the population was 4,000, and the value of town lots aggregated $3,500,000, and the number of stores and factories had increased to 207.

In 1825 the Louisville and Portland Canal Company was organized by legislative charter, and work began in March of the year following on this gigantic improvement as it was then considered.

In 1828 Louisville was incorporated as a city, and the aggregate of business transactions recorded for the year following footed up $15,000,000.

In 1830 the population of more than 10,000 were able to rejoice over the completion of the Louisville and Portland Canal.

In 1835. the Frankfort railroad was completed to Louisville, and the city, now having a population of about 20,000, was lighted by coal gas for the first time; 100 new business blocks were erected, and the shipments of salt meats reached 4,000,000 pounds, and of whisky 26,000 barrels.

In 1840 the city had a population of 21,210, with a capital of $713,675 invested in manufacturing. In 1851 the Louisville, New Albany and Chicago Railroad was opened for traffic and the work of constructing the Louisville and Nashville Railroad was begun. In the year 1853 the Jeffersonville and Indianapolis line was completed and became at once an important factor in building up the trade of Louisville to the northward. In 1860 her population numbered 68,000, and she was in a more flourishing condition than ever before; but her interests were so largely in and with the South that the beginning of the civil war at once tied up her commerce, closed her factories, suspended every industry, and, with occasional brief exceptions, paralyzed her energies during the four years of armed contest.

The close of the struggle in 1865 again opened to the Southern States the markets along the border, and Louisville again became the center of such trade and commerce as the impoverished Southern country afforded. Northern and Eastern capital, swift to see the advantages that must accrue from the altered condition of the South, socially and politically, came pouring in for investment in enterprises that have added vastly to the city's wealth and importance. Trade and industry took a new start, more vigorous and successful than ever, and the growth of the city in all that goes to constitute a prosperous and happy community has been wonderful. New railroads, the extension of old ones, the bridging of the Ohio, the enlargement of the canal and consequent promotion of river commerce, the introduction of modern methods in every department of business life, the erection of magnificent buildings devoted to commerce, manufactures, and domestic uses, the extension and liberalizing of the school system, and a thousand other matters prove that, whatever her immediate losses, Louisville was ultimately an immense gainer by the war and the changed conditions it brought about.

In 1867 the Knoxville branch of the Louisville and Nashville Railroad was built, and two years later a connection was effected with the Ohio and Mississippi Railroad at North Vernon. This latter year also saw work begun upon the bridge crossing the river over the falls.

The census of 1870 showed a population of 100,753, with a valuation of real and personal property of $70,715,620.

In 1871 the canal improvement was completed, and in 1872 the bridge was thrown open to traffic.

On January 1, 1886, by a careful estimate, the population of Louisville was 161,022, and is now probably 175,000.

TRANSPORTATION LINES.

The railroad facilities of Louisville are very complete, comprising: The Louisville and Nashville, running through Kentucky, Tennessee, Alabama, and Mississippi, to New Orleans, with branches to Cincinnati, Lexington, Knoxville, Owensborough, Evansville, Saint Louis, Shawneetown, and Memphis; the Newport News and Mississippi Valley Company, affording an outlet to Eastern and Western tide-water; the Louisville, New Albany and Chicago; the Louisville, Evansville and Saint Louis Railway; the Ohio and Mississippi Line; the Jeffersonville, Madison and Indianapolis Railroad; branches connecting the city with the Cincinnati, New Orleans and Texas Pacific system and the East Tennessee, Virginia and Georgia lines, and an up-river narrow-gauge road to Westport, Ky. Besides these there are the Louisville Southern and the Louisville, Saint Louis and Texas roads, now in course of construction, which will afford competition with established lines to the Southwest. The completion of the second railway bridge over the river at this point will enable rapid transfers of north and south bound freights and passengers to be made, for particulars of which facilities see the section on Ohio River bridges in another part of this report.

The regular steam-boat lines maintained here are: The Cincinnati and Louisville; the Louisville, Evansville and Henderson, and the Memphis and Ohio River Packet Companies, the first two named sending out a boat daily from this port and the latter a boat semi-weekly.

In addition to these more important lines there are: Two tri-weekly boats in the Kentucky River trade; a daily boat in the Madison trade; a tri-weekly boat running to Leavenworth, Ind., 60 miles down river; a boat making weekly trips between Louisville and Catlettsburgh, in the Big Sandy trade; a boat making semi-weekly trips in the Salt River trade, and a boat plying weekly between this port and Middleport, Ohio, and another making weekly trips to Mount Vernon, Ind., in the Wabash River trade. Particulars as to each of these boats will be found in the general table exhibiting the commerce of the Ohio River. The aggregate tonnage of freights carried weekly by these lines is estimated at 2,054 tons.

LEADING INDUSTRIES.

But little more remains to be said under the head of Louisville's industrial and commercial growth other than to present the figures showing her actual progress in detail. Concerning her principal products and commodities, it is only fair to state that as a leaf-tobacco market Louisville leads the world in facilities for handling and selling this chief of the staples of Kentucky. In the manufacture of oak-tanned sole-leather and harness and saddle leather she has fifteen immense establishments, employing a capital of over a million and a half of dollars; four extensive mills manufacturing Kentucky jeans, that find a market all over the country, employing nearly $1,000,000 capital and 1,000 hands and producing annually about 4,500,000 yards. In the manufacture of hydraulic cement there are eight mills in operation in and around Louisville, producing about 4,500 barrels daily all the year round, their product finding a market in every city west of the Alleghanies and south of the Ohio and Mississippi Rivers. Next to cement, whisky is the most important article of west-bound freight from Louisville, and during 1886 the total shipments by rail were 100,648 barrels, and by river 1,295 barrels. Besides these, vast quantities of agricultural implements, vehicles of all kinds, boots and shoes, furniture, sash, doors, and blinds, cooperage, steam-engines and boilers, machinery, iron pipe, architectural iron-work, farm and stock bells, stoves, tin and sheet-iron ware, lead and oil, paper, manufactured tobaccos, etc., are produced annually and reach markets distributed all over this country and Mexico.

The tables following will show for each product and article the amounts and values of shipments for a series of years, as well as the comparative growth of each industry and its means of transportation from and to Louisville:

Mechanical and manufacturing industries

[From the United States census, except for 1885 and

Industries.	1886.				1885.

*The data refer to Jefferson County inclusive of Louisville.

The apparent diminution in value of manufactured products for 1886, when contrasted with the figures for the previous year, is not by any means actual. An attempt is here made for the first time to separate the manufacturing business from the jobbing and retail trades, and to present the real values created during the commercial year, estimating the effects of strikes, special trade depressions, and the like. The aggregates are close upon the true figures, as nearly as could be learned from a thorough individual canvass of the industries specified, and may well furnish data for a new departure in statistics as kept at Louisville.

The following tables will show from the records of the Board of Trade the commercial movements of leadings articles by rail and river for a period of seven years. To quote from the report of Superintendent James F. Buckner, jr.:

"The figures in the tables for the year 1886 show, so far as such tables can show, the actual business of the city. On August 1, 1885, the collection of data relative to through freight (that is, goods passing by or through Louisville, but in no wise entering into her trade and commerce) was discontinued, and this change in the plan of collecting and tabulating data will account for what seems to be a falling off in the operations of 1886 for certain lines when compared with some previous years. These tables, excluding through shipments for 1886, however, are ample proof that the volume of business for the year was considerably in advance of 1885."

Movements of leading articles at Louisville, Ky., by routes, for seven years.

THE FUEL TRADE OF LOUISVILLE.

An important part of the city's commerce, in which the river has always had and will probably continue to hold the principal share of transportation, is the trade in coal and coke. Up to this time Pittsburgh coal and Connellsville coke have led in the trade, but the development of mines along the Kanawha River and in Eastern Kentucky is, year by year, creating a rivalry with the Pennsylvania product that is destined to become most formidable. Besides, the mines of southern Indiana, in the block-coal region, are sending each year a larger quantity of this fine grate and furnace fuel to Louisville. The Kanawha and Kentucky coals have coking qualities equal to the coal of the Connellsville mines, and the supplies drawn from the former sources for local consumption are now nearly equal to those derived from the more famous Pennsylvania mines. The following table will show the volume of the local trade in these fuels, not estimating the amounts passed by here for the down-river trade:

Receipts and shipments of coal and coke at Louisville, Ky., by river and rail, expressed in tons, for the years named below.

REMARKS.—In general tables of shipments of freights by river and rail the entries are by rail only for years included by this table, as the board of trade reports do not cover transactions of barges and flat-boats. Thus the total shipments recorded by river will not be found corresponding to the figures given by the annual reports of that organization. The figures presented in this table are those of Col. E. W. MacDonald, coal inspector of the city of Louisville during the years named and are consequently perfectly reliable.

The statement of Louisville coal consumption shows that coal transported by river enters largely into local consumption, about two-thirds of the whole, partly owing to the good quality and superior heat-producing properties; but low-priced transportation has much to do with the fact that Louisville (because of its location at the Falls of the Ohio and affording a good harbor for coal craft at all seasons) is made the distributing point for Pittsburgh coal to Southern ports. A large portion of the annual product of the Monongahela Valley, exceeding 80,000,000 bushels, is transported to market by river, quite one-half of which (40,000,000 bushels) come to Louisville; two-thirds is forwarded to Southern ports, and one-third, or about 14,000,000 bushels, remaining for Louisville consumption. This coal is brought to Louisville, a distance of 600 miles, at a cost of 1½ to 2 cents per bushel transportation (40 to 53 cents per ton), which price includes the return of empty craft, and coal is transported from Louisville to New Orleans (1,400 miles) at a cost of 2 cents per bushel (53 cents per ton), which does not include return of empty craft. Steamers returning with empty craft reduce the cost of transportation more than one-half. Towing steamers in the upper trade have a towing capacity of from 4,000 to 10,000 tons, while towing steamers in the lower trade have a towing capacity of 15,000 to 25,000 tons; as much as 28,000 tons have been towed by a single steamer.

This product is distributed to the cities of the Mississippi Valley (Saint Louis and other cities of the upper Mississippi for gas and blacksmithing purposes), the several depots for steamers' consumption. Five million bushels is delivered to plantations from the mouth of Red River to New Orleans, including Bayous La Fourche and Atchafalaya, and exceeding 10,000,000 bushels to the city of New Orleans and the Lower Coast. Coaling eastward-bound steamers is a business of some importance at New Orleans, and steamers are coaled as cheaply as at the cities and coal depots on the Atlantic coast, and with coal transported by river 2,000 miles. The railroad coal brought to Louisville a distance of 115 to 200 miles is charged a rate of 2 to 3½ cents per bushel freight (53 to 93 cents per ton); as compared with railroad coal transportation elsewhere, such rates are low. Louisville is fortunate in having coal of good quality accessible by rail, and hence not subject to the casualties of the river, and that will forever prevent famine prices, and most fortunate in having a low-priced river transportation, insuring an abundant supply of coal of superior quality at low rates.

LOUISVILLE'S LEAF-TOBACCO TRADE.

The growing of tobacco is easily the foremost agricultural industry of Kentucky, and Louisville, as the chief market of distribution, has always been in the lead in receipts, sales, and shipments of this valuable staple. With growing facilities for transportation, she has grown in importance in this branch of trade, until to-day she stands recognized as the first tobacco mart of the world, in whose enormous warehouses the agents of foreign régies compete as purchasers with representatives of the largest American manufacturers. In the report of the Bureau of Statistics upon Internal Commerce of the

United States for 1886, pages 652, 653, this subject has had thorough handling, and it will only be necessary here to present the following exhibit of receipts, sales, shipments, and stocks on hand for a period of seven years at this market to prove the justice of Louisville's claim to lead all other distributive markets. Particulars of the transportation routes by which these vast annual stocks of leaf tobacco were received and shipped will be found in a preceding table.

Receipts, sales, stocks, and shipments of leaf-tobacco (in hogsheads) at Louisville for seven years.

Years.	Receipts.	Sales.	Stocks (on hand at end of year).	Shipments.

1882	72,586	61,441	4,912	64,544
1883	100,230	88,904	3,353	96,035
1884	99,564	80,581	5,778	85,182
1885	131,448	127,123	9,730	119,589
1886	96,489	125,556	15,515	80,911

The apparent differences between sales and shipments are due to transfer of stocks to other markets, and the figures given under each head are official records of the Louisville Tobacco Board of Trade, and may be relied on as being correct.

THE LOUISVILLE AND PORTLAND CANAL.

One of the largest works, and certainly the most valuable in its results to river commerce, ever undertaken by the United States Government is the Louisville and Portland Canal, by means of which the perils and difficulties of navigation past the falls of the Ohio have been reduced to a minimum. A detailed history of this enterprise will appear in another part of this report. It is reasonable to claim that but for this great public improvement the trade of the Ohio River never would have attained one-tenth of its recorded volume, and that the cities of Cincinnati, Louisville, and Evansville would have been stunted in growth for years, until the advent of railroads. The Government is now, with a most commendable liberality, enlarging the upper portion of this canal into a basin sufficiently ample to accommodate the periodical fleets of coal barges towed here from Pittsburgh, and secure enough to protect them from the destructive ice-floes of the winter season, which have been a costly trouble on the falls since the towing system came in vogue.

NEW ALBANY, IND.

New Albany is the county seat of Floyd County, Ind., and is located 2 miles below the falls of the Ohio, opposite the western portion of the city of Louisville, and at present numbers a population of about 25,000. It was laid out in 1813, and in the following year a large number of families from New York and New Jersey established the first permanent settlement. The new town enjoyed a prosperous growth, and, being distinguished for its healthful location, attracted more settlers than either Louisville or Jeffersonville. In 1839 it was incorporated as a city, having a population of 4,200 and taxables aggregating $1,760,000 in value. In 1850 the population had grown to 8,181; in 1860 it was 12,000; in 1870 it numbered 15,396, and in 1880, the decade of its slowest growth, the city had 16,423.

New Albany boasts of 161 retail stores, 5 banks with a capital of $1,300,000 and total resources of $2,984,397, and 129 industrial establishments with an invested capital of nearly nine and a half million dollars, employing 5,370 hands. and paying out annually in wages $1,800,000, and turning out an annual product valued at $12,000,000.

The principal manufactories are the DePauw American Plate-Glass Works, covering 16 acres, and turning out the finest quality of polished plate-glass, window, skylight and flooring glass, and fruit jars; the New Albany Woolen Mills; the New Albany Cotton Mills; the New Albany Hosiery Mills, a cotton-batting factory; the Ohio Falls Iron Works (merchant and bridge iron); New Albany Rail Mills (railroad rails, fish-bars, and cable-road outfits); a steam forge works; 3 extensive bent-wood and spoke works; 4 large flouring mills; the largest stove foundery in Indiana; 2 extensive furniture factories; 7 tanneries; 4 breweries; a large boot and shoe factory; glue and fertilizer factory;

4 founderies and machine-shops; 10 cigar factories and 3 carriage and wagon factories, and a number of others. These establishments afford the following statistics for the past year:

Industries.	Number.	Hands employed.	Capital.	Value of products.
Bent-wood and spokes	3	400	$425,000	$650,000
Boots and shoes	1	45	75,000	125,000
Boilers and sheet iron	1	40	50,000	175,000
Breweries	4	60	120,000	200,000
Cotton mills	1	225	250,000	500,000
Cotton-batting mills	1	25	20,000	125,000
Cigar factories	10	325	75,000	250,000
Carriages and wagons	3	45	165,000	225,000
Drugs	1	20	80,000	125,000
Flour mills	4	55	259,500	400,000
Foundries, etc	4	320	500,000	750,000
Furniture	2	125	150,000	400,000
Forging, steam	1	100	125,000	250,000
Glass	1	1,300	2,000,000	1,000,000
Glue and fertilizers	1	25	40,000	75,000
Hosiery	1	150	75,000	150,000
Ice	3	45	70,000	117,500
Lumber	4	60	140,000	250,000
Rolling-mills	2	525	500,000	1,750,000
Saw-mills	1	55	50,000	70,000
Stove works	1	225	350,000	750,000
Stone, oil, works	2	20	40,000	75,000
Tanneries	7	225	200,000	350,000
Woolen mills	1	350	600,000	1,000,000
Total	60	4,665	6,359,500	9,762,500

The minor industries not listed above will bring the figures up to the amount previously mentioned.

Like Jeffersonville, this city has no local river lines, and much the larger part of her commerce is carried by rail, the city having outlets in all directions for such transportation of both raw materials and surplus products, and her trade extends to every point of the compass. All the down-river lines touch at New Albany and receive and discharge a considerable aggregate freight, but there are no means for ascertaining either particular amounts or values.

New Albany's rail facilities are afforded by the Louisville, New Albany and Chicago, the Louisville, Evansville and Saint Louis, and the Jeffersonville, New Albany and Louisville local line, making connections with all roads centering in that city. The completion of the Kentucky and Indiana bridge, between Portland and New Albany, noticed elsewhere as the "Sand Island" bridge, makes transfers of freight an easy and expeditious matter, and in a few months the roads just named, and also the Ohio and Mississippi road, will be using this bridge for their freight and passenger business.

There is a ferry between Portland, on the Kentucky side, and New Albany, but since the completion of the bridge its business is very much reduced, and the two small boats which compose the line average about eight passengers and a single ton of freight each per round trip, and the two boats will average one hundred and twenty trips weekly.

CANNELTON, IND.

Next after New Albany, 115 miles down the river from that city, the town of Cannelton, Ind., deserves attention as a prominent manufacturing and trading point. This place has a population of 8,000, and receives from and gives to the river a large amount of freights. An extensive cotton mill, operated by Louisville capital, draws its raw material from down-river points and ships its products principally to Louisville. Its output will average $500,000 worth of finished goods annually. In the immediate vicinity are immense deposits of fine cannel coal, from which the town takes its name. These are extensively mined, and find ready markets all along the river. The annual value of this product shipped from Cannelton is about $500,000.

There is a local line of steamers running in the Evansville and Cannelton trade, consisting of three boats, each making tri-weekly trips and averaging twenty-two passengers and 13½ tons of freights per round trip; particulars are given in the general table of Ohio River commerce. Also a small transfer boat, the *Rosa Bell*, making four daily round trips to Hawesville, Ky., across the river, which averages ten passengers and 2 tons of general freights per round trip.

Besides these boats, all the regular packet lines receive and discharge large quantities of freights here, but no statistical records are kept of the same. Within a year the place

will have a branch railroad giving direct connection northward to the Louisville, Evansville and Saint Louis Railroad at Huntingburgh, Ind., and this is expected to make serious inroads on the now lucrative business controlled by river.

TELL CITY, IND.

This is the first river town of importance below Cannelton, and has a population of about 6,000. The place was founded in 1858 by a Swiss colony, and early took rank as a manufacturing community, the leading industry being cheaper grades of furniture. There are twelve large factories of this class here, turning out nearly $1,500,000 annually; a considerable woolen mill; two large plow factories; a wagon factory; three chair factories; two tanneries; four planing-mills, manufacturing sash, doors, and blinds; a broom and brush factory; several brick and lime kilns; three extensive cooperage works; a bent-wood and handle factory; a lath and shingle mill, and two flouring-mills. The combined annual product of these, besides the furniture output, averages $3,500,000. All the imports and exports are by river, as the place is yet without a railroad. The principal purchasing points are Louisville and Evansville, and the leading markets for surplus products are found in every city of consequence in the South and West. Tell City furniture is sold from Louisville to New Orleans on the lower rivers, and a large trade is enjoyed in the Green, Tennessee, and Wabash Rivers territory. There are no local steam-boat lines here, all the commerce of the place being handled by up and down river lines. A considerable flat-boat business is carried on in brick, lime, shingles, and produce between Tell City and neighboring towns along the river as far down as Owensborough, and up to Brandenburg, below the mouth of Salt River, but no statistics are kept here of either this or the regular packet trade.

ROCKPORT, IND.

Twenty miles below Tell City, the town of Rockport, Ind., a place of 7,000 inhabitants, possesses importance as a tobacco market. Here also are large flouring and saw mills, and most of the flat-boats used in the trade between Louisville and Evansville are built here. Aside from these interests, Rockport has a lucrative trade in the general produce of the rich agricultural country extending for 20 miles back from the river. However, the importance of the town as one of the factors of river commerce has been lost to a considerable degree since the advent of a branch of the Louisville, Evansville and Saint Louis Railroad five years ago, and now much of this trade is diverted from the river to interior markets.

The leading industries are as follows:

Industries.	No.	Hands employed.	Capital.	Value of products.
Tobacco, leaf	3	75	$300,000	$750,000
Flouring-mills	3	40	400,000	650,000
Saw-mills	2	55	250,000	400,000
Flat-boat building	6	45	75,000	125,000

The tobacco handled here is grown in Southern Indiana and Kentucky, about equally divided between each source. It is rehandled here and shipped to Louisville and Saint Louis, the larger proportion going to the latter city. Cereals are received almost wholly from the country, and mill products are shipped South, principally by river. The logs for saw-milling come from the heavy forests with which the border on the Indiana side of the river is covered, and are mostly rafted down to this point. The domestic supplies for the place are purchased principally in Evansville and Saint Louis, and one-third are received by river and the remainder by rail. There are no statistics of tonnage or classification of such freights.

OWENSBOROUGH, KY.

This city, the seat of justice for Daviess County, Kentucky, is one of the most flourishing and important cities in western Kentucky, and is the center of the distilling trade in this part of the State. The capital employed in handling leaf-tobacco here is likewise very large, and between 15,000,000 and 20,000,000 pounds of this valuable staple finds its first market at Owensborough. The fact that the city has facilities for reaching other markets in all directions, both by river and rail, has contributed largely to build up her home and foreign trade upon a most substantial basis. While the two

industries mentioned are chief, Owensborough has others, which aggregate large annual products and add much to the unusual wealth of a community numbering only about 15,000 people.

The following will furnish a close approximation of the commerce of Owensborough during the past year:

Industries.	Establishments.	Capital.	Merchandise received from other markets.			Surplus products shipped to other markets.		
			By rail.	By river.		By rail.	By river.	
			South.	North-east.	South-west.	South.	North-east.	South-west.
Agricultural implements	4	$47,000	$20,000	$20,000	$12,500	$12,500	$6,500	$4,000

Leaf	25	750,000	22,000	65,000	23,000	.....	600,000	125,000

The Owensborough and Nashville Railroad, having its northern terminus here, is operated by the Louisville and Nashville Company, and the only competition it meets, save from the river lines, is at Rockport, Ind., 9 miles above, where the Louisville, Evansville and Saint Louis Railroad reaches the river. The competition by rail is, virtually, only to Louisville, since the Saint Louis division of the latter road is merely leased to it by the Louisville and Nashville Company, and the last named is able under its traffic arrangements to force all rail freights around to Evansville over its own lines, or carries freights on its steamers from Owensborough to Evansville at such low rates as to disable active competition. As will be seen from the above statistics, the commerce of Owensborough is worth contending for, and here is one of the principal producing towns in the Ohio Valley that is secured favorable rates of transportation by the influence of the river. The regular packet lines compete here for this trade, and, as will be observed, manage to get the bulk of it despite the railroads.

The local river lines consist of two boats in railroad-transfer service, plying between Owensborough and Rockport, one making three trips daily and averaging 25 passengers and 52 tons of freight per round trip, and the other making daily round trips and averaging 10 passengers and 2 tons of freight to the round trip. A boat also makes daily trips to Cannelton and return, averaging 25 passengers and 65 tons of freight each trip, and another vessel runs daily between Owensborough and Evansville, averaging 35 passengers and 20 tons of freight. Besides these the regular Louisville and Evansville packet lines and all the larger boats in the Memphis trade make this a profitable landing point.

The city wharf-boat handles an average of 100 tons daily; the freight discharged here consisting chiefly of flour, feed stuffs, furniture, tobacco, and general merchandise, and the shipments being whisky, tobacco, hides, tallow, and general merchandise. Most of the shipments go up the river, and leaf-tobacco is nearly all sent to Louisville and Cincinnati. Manufactured tobacco goes down to Evansville chiefly, and is there reshipped by rail to points West.

There is a large amount of corn received from the adjacent country loaded on flat-boats and barges and towed in for consumption by the eight large distilleries here, and a con-

siderable traffic in lime is carried on in the same way with points below. No data are accessible as to amounts or value of this trade, which is not included in the foregoing table, but it is certainly quite as large in tonnage and value as that carried by the regular steamers, if not larger.

The interstate-commerce law has created no difference in river rates for passengers and has had no appreciable effect upon the general volume of business. It has, however, enabled a somewhat better freight rate to be charged since the competing railroads have not been able to cut local tariffs as they could do before the law went into effect.

EVANSVILLE, IND.

According to its population and capital, this city transacts a more diversified business upon Western river highways than any other along the whole course of the Ohio. It occupies a commanding position over the Green and Barren, the Cumberland, Tennessee, and Wabash Rivers, and holds the reins of their commerce. Evansville is the second city in Indiana, and claims to have at present 40,000 inhabitants. The commerce of the city is still and for years must continue to be chiefly conducted over the rivers named, although there are excellent railway facilities here, extending to leading markets in nearly every direction. These railways are: The Evansville, Terre Haute and Chicago; the Louisville, Evansville and Saint Louis; the Peoria, Decatur and Evansville, and the Saint Louis division of the Louisville and Nashville, commonly known as the Saint Louis and Southeastern. The city has connection likewise with the Henderson and Nashville line of the Louisville and Nashville system via the fine bridge across the Ohio River at Henderson, described elsewhere in this report. Thus it will be seen the city is able to reach both Saint Louis, Chicago, Louisville, Cincinnati, and Eastern cities, on the north, and the leading cities of the South by direct rail routes.

When it is asserted, therefore, that Evansville has a proportionately larger river trade than any other point along the course of the Ohio, the statement derives its reason from the fact that the city transacts in this way business with an immense area of country contiguous and adjacent to the navigable streams mentioned, whose only outlet is afforded by water, and the annual aggregate of trade between Evansville and these vast regions, where the whistle of locomotives is never heard, reaches into a sum far greater comparatively than is netted by rail carriage. Furthermore, the city, being an important industrial center for the production of articles in demand in the lower river country, the cheapness of water transportation to such markets likewise adds to the volume of Evansville's water commerce materially large sums annually, which railroad competition has not as yet succeeded in winning away.

In 1869–'70 the value of this river trade was placed by Capt. G. W. Rowley, United States consulting pilot of thirty-seven years' experience along the Ohio River, at twelve and a half millions annually. It is quite certain that it has not grown less since then, although it is a work of extreme difficulty to secure definite details now. An approximation of these values may be drawn from the following table of current commercial operations at Evansville by river, remembering that on account of its latitude the season of navigation on all the rivers listed averages at least ten months each year, and that the estimates of tonnage assigned to individual boats is placed very low in order to be certain the aggregate will not be overdrawn:

River trade of Evansville.

OHIO RIVER.

* Registered at Nashville, Tenn.

From these figures, allowing for interruptions caused by accidents, low water, fogs, storms, etc., it is plain that the commerce carried on by means of the regular packet lines of Evansville alone will aggregate nearly 170,000 tons annually, which at an average valuation of $62.50 will make the total value of this class of trade $10,625,000. To this remains to be added the Wabash River trade to and from Evansville, and the valuable business of the Pittsburgh and New Orleans, and Cincinnati and New Orleans, and Cincinnati and Memphis lines, and the business of the Pittsburgh coal fleet. So that it is probably fair to claim, as many of Evansville's business men do, that the average of the annual volume of river business transacted at this port will reach fully $15,000,000 in value.

In the above tables the trade of Evansville in and out of the Wabash River is not given, from the reason that no statistics of tonnage or classification could be gathered. This trade is both large and profitable, however, and the exports from that stream consist of grain, tobacco, whisky, flour, and general produce. The trade is divided between Evansville, Mount Vernon, Shawneetown, Uniontown, and smaller Ohio landings, but the main part is marketed in Evansville. The general port list of steam-boats will show the number of vessels engaged in this trade, all of which are registered at Evansville.

LOCAL AND JOBBING TRADE.

The combined local and jobbing trade of Evansville has been computed at nearly $25,000,000 annually. In this sum the value of manufactured products is included, and will appear more in detail in the following table, which is an approximation of the results of mechanical industries for the past commercial year:

Industries of Evansville, Ind., for commercial year 1886–'87.

Industries.	Establishments.	No. hands employed.	Capital.	Value of materials.	Where procured.	Value of products.	Surplus—where distributed.
Agricultural implements	4	250	$325,000	$215,000	Wood from local mills and southern Indiana; iron and steel from Pittsburgh and local founderies.	$635,000	Mostly in Southern States, southern Indiana, and Illinois.
Breweries	2	50	150,000	70,000	From western Kentucky and southern Indiana	225,000	South and West, principally by river.
Brick and tile	8	195	95,000			140,000	Illinois, and Wabash valley in southern Indiana.
Boots and shoes	2	100	120,000	50,000	Uppers and sole leather from Louisville, chiefly	90,000	South and West, in river regions and mines.
Car works	1	65	175,000	95,000	Wood and timbers from local mills; wheels from eastern cities.		
Carriages and wagons	6	350	750,000	225,000	Iron and steel from Pittsburgh; wheels from Indianapolis, etc.; trimmings from Buffalo, N. Y.	537,500	West and South, principally by river.
Canned goods	1	40	20,000	45,000	Southern Indiana products	59,500	South and in Illinois and Indiana.
Cooperage	5	425	325,000	200,000	From southern Indiana, chiefly	415,000	Kentucky and Illinois, to distilleries and flouring mills.
Cotton mills	1	600	1,500,000	425,000	From the Southern States, principally Mississippi; received by river mostly.	650,000	Leading markets of West and North.
Coal and coke	4	85	450,000	500,000	Pittsburgh, Cannelton, and southern Indiana mines		Local consumption only.
Clothing	4	60	200,000	85,000	Cincinnati and Louisville and New Albany; by rail and river.	145,000	South and North, in Indiana and Illinois.
Confectionery	2	45	40,000	20,000	From Louisville and Chicago; raw sugar from lower river.	30,500	Chiefly South, by river.
Coffins, etc	1	200	325,000	150,000	Lumber from local mills; trimmings from Chicago and eastern cities.	475,000	All through the West and South, principally by rail.
Drugs	3	35	250,000	70,000	At all principal cities in East; roots and herbs from South.	250,000	South and West, chiefly by rail.
Founderies, etc	7	1,400	2,150,000	975,000	Pig-iron from Cumberland and Tennessee Rivers and Pittsburgh; steel from Pittsburgh; copper from Chicago.	2,000,000	Large local trade; machinery chiefly in Indiana, Illinois, and Kentucky; plows, etc., to South.
Flouring-mills	4	55	650,000	350,000	Out of Southern rivers and western Kentucky, southern Indiana, and eastern Illinois.	615,000	Chiefly to Southern States, by river.
Furniture	3	750	1,250,000	475,000	Woods from local mills; veneers from Cincinnati and New York; castings from local founderies.	1,350,000	South and West, all leading markets.
Groceries	12	79	500,000	845,000	From Eastern markets; raw sugars from Louisiana, by river.	1,000,000	Southern States and lower Indiana and Illinois.
Hardware	4	250	270,000	325,000	Iron and steel from Pittsburgh; some wrought-iron from Alabama and Tennessee.	845,000	West and South, by river chiefly.
Hominy and grits	1	30	45,000	65,000	Southern Indiana and central Illinois	90,000	Southern States.
Hubs and spokes	2	95	120,000	75,000	Out of Cumberland, Green, and Tennessee Rivers; some from southern Indiana.	115,000	Eastern and Northern cities; large local demand.
Leather, tanned	3	75	75,000	47,500	From Indiana, Illinois, and western Kentucky	65,500	Aside from local demand, chiefly in South.

Leaf	7	250	950,000	2,795,000	Kentucky and southern Indiana	2,795,000	East to Louisville and Cincinnati; some to Saint Louis.
Miscellaneous	37	350	425,000			650,000	
Totals	177	8,373	15,640,000	11,927,500		18,638,000	

*Including shingles, lath, heading, and staves.

The cross-river commerce by rail at this point is summarized in the table of the Louisville and Nashville Railroad, Henderson division, in the section relating to this special subject. The amounts of freight brought into the city by various rail routes north, east, and west could not be procured, and no local records are kept by the companies from which such figures could be compiled. The Board of Trade does not undertake to separate such statistical records as are preserved here into the class of data required by this report, and only by comparisons and subtractions between the ascertained tonnage and value of river freights and the aggregate values of local products can even an approximation of the respective values of river and rail transportation agencies be calculated for this city. The fact remains clear, however, that Evansville continues to owe much the greater part of her commercial importance and accumulating wealth to the great water-ways before her gates, which penetrate rich mineral and agricultural territory for hundreds of miles where the railroads have never come and may not come for years.

HENDERSON, KY.

This is one of the oldest settlements in western Kentucky, and has long been the entrepôt for a large trade in tobacco and grain, and has the largest tobacco stemmeries in the country.

Henderson was founded by Col. Richard Henderson, president of the Transylvania Company, and laid out in 1797. It was chartered as a town in 1810 and as a city in 1867. It is situated midway between Louisville and Cairo and occupies a more elevated site than any other city on the Ohio River. It is the seat of Henderson County, Ky., and claims a present population of 12,000, with 33,000 in the entire county. There are 51 regular manufacturing establishments in the city, including the tobacco stemmeries, and 130 business establishments of all kinds. Nearly all these manufactories were established since 1880, except the stemmeries, which are of older date. In the county, outside of the city, there are 20 manufacturing concerns, among which there is a large hominy mill, located on the river a short distance below Henderson, to which subsequent allusion will be made. The total value of the manufactured products of all these for the year 1886 was $3.493,000. All the capital invested in these concerns, save about $300,000, is owned by residents of the city or county.

Of the tobacco handled here, the bulk finds its chief market in Europe; London and Liverpool take the raw cotton, and woolen goods are disposed of in the West and South and neighboring cities.

About one-eighth of the total annual products of manufacture is consumed in the State and the remainder outside. The routes and directions taken by these surplus goods are indicated by the table below. Nearly 2,500 hands find constant employment in producing these goods, but no separate statement was procurable from the various establishments. Raw materials are drawn as follows: Tobacco, corn, and timber, from the immediate vicinity; cotton, from the South, and wool, from the West, East, and the vicinity.

When the river is navigable rates of transportation are lower, and, in fact, there are no other means to reach a large number of trading points than by boats.

About 100,000 tons of freight were received here by river from the South, and 150,000 tons from the North by river during 1886. From the South these freights consisted of corn, wheat, tobacco, cotton, lumber, shingles, sugar, molasses, and general merchandise; from the North, of corn, wheat, tobacco, lumber, lime, shingles, furniture, and general merchandise. The shipments South by river during that year consisted of hominy, grits, meal, flour, tobacco, whisky, and general merchandise, aggregating 50,000 tons; to the North 75,000 tons were sent in the same way, consisting of tobacco, lumber, laths, whisky, cotton goods, woolen goods, and general merchandise. No statistics are kept here of the exact tonnage of each commodity.

The approximate tonnage of freights received by rail from various points during 1886 was 41,387, consisting of live-stock, grain, railroad iron, tobacco, and general merchandise. The tonnage of freight shipped by rail was 44,575, consisting of grain, live-stock, tobacco, hay, hominy, and general merchandise. Values not given specifically beyond such separation as is made by the table following.

The difference between rail and water rates from Henderson to competing points on the river is from 1½ to 20 cents per 100 pounds in favor of the river.

Henderson's mercantile supplies are drawn from New York, Boston, New Orleans, Saint Louis, Chicago, Cincinnati, and Louisville, and the routes by which they are received are shown by the table to follow.

The average number of steam-boat arrivals per day at Henderson for the years between 1840 and 1886 is ten; no regular record is kept, however, and this is merely an estimate.

The above facts were procured from Stephen K. Snead, esq., of Henderson, who is one of the few to respond to circular letter B, asking for such information.

Commercial movements of leading articles at Henderson, Ky., for the commercial year 1886–'87.

RIVER TRADE OF HENDERSON.

The boats composing the regular lines terminating or touching regularly at Henderson will be found listed on the general table of Ohio River commerce, and nothing more than a brief reference will be necessary here.

The Evansville and Henderson Packet Company, consisting of one boat, makes three trips daily to Evansville. Henderson receives by this line about 75 tons of freights and ships about 30 tons per week.

The Evansville, Cairo and Memphis Packet Company has a daily boat touching here. Henderson receives about 60 tons per week, consisting of corn, wheat, tobacco, lumber, and shingles, and ships about 30 tons per week, consisting of general merchandise and lumber.

The Memphis and Cincinnati Packet Company makes two landings here weekly. Henderson receives by this line about 25 tons per week of groceries, iron, nails, etc., and ships about the same amount of cattle, rags, hides, whisky, furs, tallow, and tobacco.

The Louisville and Henderson Packet Company brings to Henderson twice per week about 20 tons of freghts, made up of general merchandise, salt, cement, tobacco, and shingles, and takes out the same quantity of corn, wheat, whisky, cattle, hogs, sheep, lumber, laths, and tobacco.

The Southern Transportation Company lands two boats weekly at Henderson, and takes away about 20 tons of tobacco, whisky, cornmeal, grits, and hominy per week, but discharges little or no freights here.

The Evansville and Tennessee River Packet Company sends a weekly boat to this port, which leaves about 25 tons at each visit, consisting of cotton and lumber. The freight taken away is insignificant.

The Cumberland River Packet Company has a weekly boat to Henderson, with a total weekly freight in and out of about 5 tons, consisting of general produce, tobacco, etc.

There is a railroad wharf-boat here that does a large receiving business, averaging about 200,000 tons per annum, for transfer to the Henderson Division of the Louisville and Nashville Railroad. A large proportion of this business is local freight, consisting of corn, and the remainder is composed of hay, wheat, apples, etc., which goes to Southern markets. Local tugs also handle large quantities of staves, shingles, corn, and wheat, but no approximation of amounts or values of this business can be made safely. There is likewise some flat-boat traffic above and below Henderson, in a small local way, and this consists of lime, stoneware, lumber, staves, coal, etc.

There is very little ferrying done here since the completion of the Henderson railway bridge, and the single boat in use suffices for all requirements. This vessel carries passengers, cattle, and vehicles, and occasionally takes a full load of cattle to Evansville. The tow-boat *Emma Cooper* is run in the interests of a large hominy mill, located just below Henderson, and handles during the year about 300,000 bushels of corn, besides a large amount of hay, wheat, potatoes, etc., in a quasi local trade.

RAILROAD FACILITIES.

Henderson has good outlets by rail to Northern and Southern markets directly, and indirectly to the West and East, over the Henderson Division of the Louisville and Nashville Railroad, but the particulars of all rail traffic are reserved to the section "Cross-river commerce," and will not be here considered. Another line of road is being constructed which will, in another year, give Henderson direct connection with all the Southwestern markets, and contribute very materially to enlarge her trade in that direction.

A description of the fine bridge spanning the Ohio at this point will be found in that section of this report referring to Ohio River bridges, and a profile of the structure appears in the appendix hereto.

PADUCAH, KY.

This city, of about 18,000 population, is the seat of McCracken County, Ky., and is located at the mouth of the Tennessee River, where that stream joins the Ohio, 48 miles above Cairo and 136 miles below Evansville. Paducah has long enjoyed the advantage of being the chief transfer point for the immense traffic coming out of the rich districts penetrated by the Tennessee, and has a large local trade with that region. Besides the two rivers, the city has railway connection with all the roads centering at Louisville, on the east, and at Memphis, to the west and southwest. The line now in operation forms part of the great Newport News and Mississippi system of roads, reaching from the Atlantic tide-waters to the Gulf, at New Orleans. For a long period the industry of ship-building was extensively carried on here, but of late years it has decreased as at all other points where it was once the leading branch of business.

The chief imports and exports of the city are given in an accompanying table, with the estimated value of each for the commercial year 1886–'87. Within the last calendar year Paducah has had a marked impetus given her industries by the investment of large amounts in the development of coal and iron in the contiguous fields of western Kentucky, and her remarkable facilities for cheap transportation of these ores and fuel are certain to build up an enormous iron interest in the immediate future. Unfortunately, no regular system of commercial reports has been in vogue here, and what meager statistics are presented were collected with unusual difficulty.

PADUCAH'S RIVER TRADE.

The following are the regular lines receiving and discharging freights at Paducah:

Evansville, Cairo and Memphis Packet Company, a daily boat; discharges about 200 tons per week at this port, consisting of groceries, produce, etc.; takes from Paducah about 100 tons of tobacco, cotton, etc., per week.

Cincinnati and Memphis Packet Company, two boats per week. Paducah receives 300 tons per week by this line, chiefly general merchandise, and ships about 400 tons of hides, tallow, tobacco, iron, rags, flour, etc., per week.

Southern Transportation Company (Cincinnati and New Orleans line), semi-weekly boat. Paducah receives weekly 10 tons of sugar, coffee, etc., on up trips, very little on down trips, and ships weekly about same amount of tobacco, furniture, flour, etc.

Cumberland River Packet Company, three boats per week, discharges about 600 tons of pig-iron, tobacco, hides, timber, etc., and receives about 250 tons of general merchandise per week.

The Tennessee River Packet Company comprises the following steamers: *Clyde*, from Evansville; *Silver Cloud*, from Paducah; *W. H. Cherry*, *City of Florence*, and *John Gilbert*, from Saint Louis. Paducah receives from this line about 300 tons weekly, consisting of cotton, pig-iron, tobacco, lime, peanuts, lumber, hides, etc., and ships about 100 tons weekly, consisting of dry goods, groceries, and general merchandise destined to up-river points.

The Paducah and Cairo Packet Company, one boat, makes daily trips, discharging here about 75 tons of freight per week, composed chiefly of tobacco and wheat, and receives about 15 tons per week, consisting of groceries and general merchandise.

The Saint Louis and Paducah Packet Company, one vessel, semi-weekly trips. Paducah receives by this line about 200 tons per week of corn, bran, flour, oats, and general merchandise, and ships about 50 tons per week, principally lumber, pig-iron, hides, etc.

Paducah and Mount Vernon Packet Company, one boat, makes tri-weekly trips between Mount Vernon, Ind., 101 miles above, and Paducah; carrying to the latter port about 200 tons weekly, consisting of hominy, grits, flour, apples, potatoes, and fluor-spar for the Tennessee River iron furnaces.

Paducah and Metropolis Packet Company, one boat, makes two trips daily, except Sundays, and brings from Metropolis, Ill., 10 miles below, about 5 tons daily of wheat and corn and takes back about the same amount of flour.

There is no flat-boat trade done from Paducah, but a considerable amount comes out of the Tennessee River consigned to Cairo and points below, which consists chiefly of staves, country produce, and peltries.

The ferriage at this point is with Owen's Landing and Brooklyn, Ill., and is composed for the most part of hay, corn, oats, apples, and market vegetables. One boat is engaged by this trade, which runs all the year round, making six trips daily. No figures of the tonnage carried could be obtained.

The table following exhibits the movements of leading Paducah commodities, approximately, for the past commercial year ended July 1, 1887:

Commercial movements of leading articles at Paducah, Ky., for the commercial year 1886–'87.

CAIRO, ILL.

This city, originally expected to become the metropolis of the West, through its location at the mouth of the Ohio and its central position on the great Mississippi, chiefly failed to reach that distinction by reason of its unhealthy site and surroundings. Built upon swampy ground, subject to overflows by both rivers, its commercial advantages were kept in abeyance until the railroads gained foothold in the Ohio and Mississippi Valleys and became such formidable competitors of water transportation. Struggling for years to realize the intentions of its founders, Cairo grew in population much more slowly than its actual volume of trade would indicate, and to-day the city has probably not more than 14,000 inhabitants, while its local and jobbing trade reaches nearly $7,000,000 annually, and its combined shipments north and south, by rail and river, aggregated, for 1886, the enormous value of $60,000,000.

The Cairo of to-day has made many improvements over the *ante-bellum* town. It has better sanitation, being now substantially protected from overflows by strong levees, and is as well drained and has as complete a sewerage system as any town can have in its peculiar situation.

It is a misfortune, from a historical standpoint, that no commercial statistics have been kept of the immense trade that has passed in and out of the Ohio at Cairo during three generations, and that the future historiographer of American river commerce must be confined to bare conjecture upon this point. Only under the impulse given by this undertaking of the Bureau of Statistics has anything like a systematic effort ever been made to ascertain the volume and direction of the trade of Cairo, and this has, perforce, been confined to the transactions of a single year. The discontinuance of Cairo as a port of inspection and registry for steam-vessels and the removal of the records to Saint Louis in December, 1883, have likewise contributed to cripple such facilities as ever existed for procuring definite statistics of the Ohio River trade at this point.

For the figures given in accompanying tables concerning Cairo's trade in 1886, Hon. J. S. Rearden, city comptroller, is entitled to credit, and his work is as complete and accurate as the circumstances allowed.

THE EXISTING RIVER TRADE.

It only remains to present, briefly, a detailed statement of the different steam-boat lines having connection with the commerce in and out of the Ohio, together with the volume and general character of their respective business, and next to speak with equal brevity of the railway facilities of the city, all reference to the details of cross-river commerce here being postponed to another section of this report.

First, then, the Ohio River lines touching or terminating at Cairo are as follows:

The Cairo and Paducah Packet Company, one boat, making daily trips. Cairo receives 200 tons weekly, composed of grain, lumber, live-stock, tobacco, fruit, vegetables, and poultry, and ships about 125 tons weekly, consisting of bacon, lard, hay, and general merchandise. This boat, the *Gus Fowler*, does not miss more than five trips during the entire year.

Evansville, Cairo and Paducah Packet Company, weekly trips between Evansville and Cairo. Cairo receives by this line about 50 tons per week, consisting principally of wheat, flour, salt, and general merchandise, and ships about 10 tons weekly, made up of all sorts of merchandise.

The Cincinnati and Memphis Packet Company makes semi-weekly trips. Cairo receives about 75 tons weekly, consisting of stoves and hollow ware, iron, nails, glassware, oil, iron pipe, etc., and ships a weekly average of 75 tons of grain, flour, salt, hay, hog products, and general merchandise.

Southern Transportation Company (Cincinnati to New Orleans), semi-weekly trips. Cairo receives 50 tons per week of cotton, lumber, shingles, cotton-seed, cotton-seed oil, etc., and ships about 500 tons weekly of flour, grain, hay, meal, meats, and general plantation supplies for Lower Mississippi points.

The Cumberland River Packet Company, weekly trips from Cairo for a season of six months. Cairo receives about 50 tons weekly by this line, consisting of pig-iron, tobacco, cotton, and live-stock, and ships an average of 75 tons per week, mostly grain, with a fair proportion of salt, flour, and general merchandise from local consignors.

Tennessee River Line makes tri-weekly trips each way. Cairo receives 150 tons per week of cotton, peanuts, wheat, live-stock, lumber, and general merchandise, and ships 100 tons weekly of flour, wheat, and general supplies. Saint Louis is the lower terminus of this line.

Saint Louis and Paducah Packet Company, one steamer; makes semi-weekly trips. Cairo receives 300 tons per week, consisting of flour, grain, and general merchandise, divided about equally between out and in trips, and ships about 25 tons weekly of general merchandise, principally consigned to Paducah.

Besides the above lines, which are more directly in the Ohio River trade, Cairo has the following Mississippi River lines, each of which contributes something to the east-bound commerce of the other lines, and likewise receives freight from Ohio River points transferred at Cairo:

The Saint Louis and New Orleans Anchor Line, five boats up and down at Cairo weekly. Cairo receives about 400 tons weekly by this line, consisting of cotton, shingles, cotton-seed, cotton-seed oil, sugar, molasses, fruits, etc., and ships about 1,000 tons weekly of grain, flour, hay, meal, and general merchandise, of which about 35 per cent. is out of the Ohio River.

The Saint Louis and Mississippi Valley Transportation Company averages 90 trips per year, and owns in service 9 tow-boats and 100 barges. Cairo receives about 60 tons per week of cotton and lumber by this line, and ships about 600 tons weekly of grain, hay, flour, meal, etc., nearly all of which is drawn from Ohio River points. In addition, Cairo is the coaling station of this line, and each tow-boat on down trips usually carries about 1,000 tons of coal in barges along with regular freights. On the up trips each steamer in similar fashion handles between 200 and 500 bales of cotton, besides bringing up the empty barges. Of this cotton, the aggregate carried up the Ohio River by other lines from Cairo in 1886 was 59,958 bales.

There are a number of local tow-boats engaged in rafting lumber to Cairo for transfer to the railroads, but no estimate of the volume or value of this trade could be secured. These boats procure their tows within a radius of 150 miles from Cairo, principally out of the smaller tributary streams of the Mississippi.

A great many flat-boats are loaded here annually, and are floated down the Mississippi, conveying grain, flour, meats, potatoes, etc., to the alongshore plantations.

No statistics of this class of trade could be collected and the matter is not properly within the scope of this report.

One steamer attends to all the ferrying trade at this point, making four trips daily between points on the Illinois, Kentucky and Missouri shores. Cairo receives by this boat about 200 tons daily, consisting of produce, tobacco, grain, etc., and ships about 50 tons daily of flour and general merchandise.

RAILROAD LINES.

Five railroads center here, which either have their actual terminus in the city or reach it from across the rivers by powerful transfer boats, capable of carrying several loaded cars at each trip. These roads are as follows:

Mobile and Ohio, extending from Columbus, Ky., a few miles below Cairo, on the Mississippi, to Mobile, through the States of Kentucky, Tennessee, Mississippi, and Alabama, and tapping the rich coal, iron, and cotton regions of those States;

Illinois Central, a direct line to Chicago, and connected in a traffic arrangement with the Chicago, Saint Louis and New Orleans road as a through route between the lakes and the Gulf of Mexico;

The Cairo, Vincennes and Chicago, providing another valuable route to the North and Northeast by way of Vincennes and Indianapolis, tapping the Indiana coal fields;

The Saint Louis, Iron Mountain and Southern, between Saint Louis and all points in Missouri, Arkansas, and Texas; and,

The Saint Louis, Alton and Terre Haute, providing a competing line to Saint Louis.

Beside these, the Wabash system connects with Cairo from Mound City by transfer steamer and gives another outlet to the Northeast and East, and the Newport News and Mississippi Valley Company affords an indirect connection and outlet for Cairo commerce with Kentucky, Virginia, and the Eastern seaboard cities by way of Fulton, Ky., and the Mississippi Central road.

In the absence of any bridge at this point, all the "through" freight and passenger business is handled by transfer steamers, of which there are four, owned respectively by the Mobile and Ohio, the Illinois Central, the Saint Louis, Iron Mountain and Southern, and the Saint Louis, Alton and Terre Haute roads.

From these data it is easier to understand how Cairo, instead of becoming a great river city, has been made more of a transfer station along the North and South railroad lines. Few places in the Mississippi Valley have more abundant facilities for railroad transportation, certainly none any more favorable position as to water carriage, and yet none has reaped so little apparent material benefit as Cairo among the towns of anything like equal natural prospects. And yet if the navigation of the great Ohio Valley shall receive due improvement by Government largess, the time may still come when Cairo shall more nearly realize the dreams of her founders and take on a new growth with the expanding energies of a revivified river commerce.

The following tables will show what the commerce of the city has been during 1886:

Manufactures of Cairo and Alexander County, Ill., for year 1886.

Industries.	Materials used.	Value of materials.	Value of products.
Flouring mills	1,189,840 bushels wheat	$951,878	$1,536,330
Corn-meal mills	539,980 bushels corn	194,796	248,870
Saw mills	18,191,754 M feet timber	1,455,340	2,138,009
Wood manufactures		582,600	854,800
Iron and steel manufactures	42,790 tons iron 9,325 tons steel	174,600	209,520
Miscellaneous		138,300	175,000
Total		3,497,514	5,207,529

Classified industries of Cairo and Alexander County, Ill., for year 1886.

Industries.	Number.	Number hands employed.	Capital invested.	Amount wages paid.
Flouring mills	7	150	$537,500	$90,000
Corn-meal mills	6	29	95,000	22,500
Saw mills	8	300	750,000	180,000
Wagon factories	7	125	250,000	100,000
Miscellaneous	12		145,000	
Total	40	604	1,777,500	392,500

Local grain and merchandise trade—wholesale and retail—of Cairo, for year 1886.

Articles.	Quantities.	Values.	Articles.	Quantities.	Values.
Wheat ... bushels	765,000	$689,500	Flour ... barrels	233,070	$900,547
Corn ... do	2,089,343	473,056	Corn meal ... do	56,500	113,000
Oats ... do	2,405,576	769,783	General merchandise		3,125,698
Hay ... tons	20,157	241,884			
Bran ... do	4,510	63,140	Total		6,520,795
Provisions ... pounds	867,000	54,187			

Classification of freights shipped south by river at Cairo during year 1886.

Articles.	Quantities.	Values.
Wheat ... bushels	1,018,930	$1,018,950
Corn ... do	805,796	282,019

Salt ..... barrels...	63,916	143,811
Total	.....	24,720,785

It should not be forgotten that the figures given in the tables of classified river freights represent the aggregated trade at Cairo by both the Ohio and Mississippi Rivers, and that no separation is attempted between them by reason of insuperable difficulties growing out of the method in which wharfage records are kept at this point. A careful study of the up and down river freight business of boats navigating the Ohio and its tributaries will enable a summary closely approximating exactness in tonnage and values, and this sort of a summary will be included elsewhere in the present report.

SUMMARY OF OHIO RIVER TRADE.

Fortunately for the purposes of this report, Capt. Thomas P. Roberts, assistant United States civil engineer, aided by Capt. G. W. Rowley, United States consulting pilot, in 1868–'69 prepared a summary of the general character and estimated value of the Ohio River commerce by cities, towns, and principal landings between Pittsburgh and Cairo. At that time the river trade was nearly at the maximum. The enlargement of business to extraordinary dimensions caused by the war had then had time to settle down to a peace footing, and the day when the river was crowded from end to end with flotillas bearing men and munitions for the contest was sufficiently long past to allow an estimate of river commerce, pure and simple.

This summary is the only one extant, and is presented here as of special value in affording a comparison with the similar table prepared to show the volume and character

of the river traffic during 1886. The latter has been most carefully made, and, as an estimate, will cut more closely to the real figures than the former, because the statistical resources of the important cities on the Ohio have been much improved since 1868-'69, and have enabled very accurate estimates to be worked for what constitutes a greater part of the trade carried up and down this broad stream.

Instances will be observed in the summary for 1886 where, despite near-by railroad competition, the general volume of trade by river has been increased. It will, no doubt, be readily understood that this fact is attributable to the growth of population and the consequent development of national resources.

In a number of important places industries that were large and flourishing at the time the first summary was prepared are now either extinct or very greatly contracted in their operations. These industries are: Boat-building on the upper river and the central section where it formerly was most important; coal mining on the upper river, reduced in output by the abundant use of natural gas; iron smelting along the Eastern Kentucky and Ohio shores, caused by the development of similar industries in Tennessee and Alabama; pork-packing at all points below the mouth of the Big Kanawha, encroached on by competition with the packing centers at Cincinnati and Louisville, and rapid transit of live-stock to more profitable markets; cotton-milling closed at several points by cheaper manufactures in the South, or by those of larger mills in the same market territory; hemp-growing in Kentucky, Southern Indiana, and Illinois, caused by competition with foreign fibers, jute, etc.

On the other hand, where there has been no overproduction nor unusual rail competition, it will be seen that the general trade, especially at smaller landings, has been gratifyingly increased. Almost without exception such places have gained in every important branch of trade, some 50 and some 100 per cent., since 1869. This fact speaks volumes in behalf of the thrift of the inhabitants and the wonderful fertility of the Ohio Valley.

It should not be forgotten that the apparent decline of river traffic at various points is not indicative of commercial decay for such communities. The almost omnipresent rail competition is an element in the count that brings up commercial footings to several times more than the totals of water transportation for all points where the two run counter to each other.

However, the very best commentary upon these points is the summary itself, which is given below:

Summary of the character and value of the Ohio River commerce by cities, towns, and principal landings for the years 1869 *and* 1886 *from the source to the mouth of the river.*

Place.	Miles from Pittsburgh.	Exports.	Imports.	Estimated value in 1869.	Estimated value in 1886.	Remarks.
Pittsburgh, Pa		Iron, coal, lumber, oil, and general manufactures.	Iron and copper ores, steel, cotton, grain, provisions, live-stock, etc.	$150,000,000	$64,750,000	Reduced by rail competition.
Saw-mill Run, Pa	1.5	Coal and salt	Timber, general supplies	2,000,000	1,200,000	Do.
Manchester, Pa	1.5	Salt and steam-boat hulls	Lumber, copper, and iron ore	1,500,000	820,000	Do.
Glass House, Pa	2.2	Refined oil	Crude oil	100,000	65,000	Do.
Harbaugh Furnace, Pa	3.0	Pig-iron and blooms	Iron ores	200,000	90,000	Do.
Chartier's Creek, Pa	3.4	Hulls and lumber	Saw logs	10,000	20,000	
Ardesco Oil Works, Pa	3.9	Refined oil	Crude oil	150,000	95,000	Reduced by pipe lines.
Pork House, Pa	4.2	Iron rails and bars		50,000	25,000	Reduced by rail competition.
Middleton, Pa	11.5	Lumber	Saw logs	20,000	12,000	Do.
Shousetown, Pa	15.0	Hulls for barges	Lumber	25,000	15,000	General decline of ship-building.
Brick Works, Pa	16.7	Ornamental brick		10,000	15,000	
Little Sewickley, Pa	17.0	Hulls and barges	Lumber	5,000	10,000	
Economy, Pa	18.0	Garden seeds, fruits, etc		5,000	10,000	
Baker's Landing, Pa	23.3	Building and flag stone		5,000	15,000	
Freedom, Pa	24.0	Refined oil and petroleum products.	Crude oil and lumber	60,000	19,500	Reduced by pipe lines.
Rochester, Pa	25.5	Copper, iron ore, and general hardware.	Logs, iron, etc	3,400,000	45,000	Reduced by rail competition.
Phillipsburgh, Pa	25.5	General merchandise		25,000	45,000	
Beaver, Pa	26.0	do			120,000	
Fire-brick Works	27.0	Fire-brick and building stone		20,000	35,000	
Montgomery's Island	31.9	Building and curb stone		2,000	5,000	
Industry, Pa	33.5	Hulls and boats	Lumber, etc	10,000	15,000	
Shippingport, Pa	34.8	Coal	General merchandise	25,000	4,500	Do.
Smith's Ferry, Pa	40.0	Crude oil and whisky	do	500,000	120,000	Reduced by pipe lines and tank rail transportation.
Georgetown, Pa	40.0	Produce, etc	do	6,000	12,000	
East Liverpool, Ohio	44.0	See East Liverpool statistics		150,000	225,000	
Walker's Landing, Ohio	46.0	Earthenware and sewer pipe	Coal, general merchandise	100,000	125,000	
Wellsville, Ohio	47.9	Boats and machinery	Lumber, coal, etc	100,000	110,000	
Brooklyn, W. Va	50.6	Hulls and lumber	Logs, general merchandise	10,000	12,000	
New Lexington, W. Va	53.0	Baled hay and produce	General merchandise	15,000	25,000	
Port Homer, Ohio	53.5	do	do	10,000	20,000	
New Cumberland, W. Va	56.0	Fire-brick and pottery	Coal and general merchandise	250,000	140,000	Industry declined to a large extent.
Black Horse Landing	58.0	do	do	100,000	75,000	Do.
Freeman's Landing	59.0	do	do	100,000	75,000	Do.
Cable's Eddy, Ohio	65.0	Coal and coke	do	10,000	27,500	

Steubenville, Ohio	67.5	See Steubenville statistics		8,000,000	175,000	Overestimated in 1869. Reduced by railroads.
Coal Works, Ohio	73.0	Coal and coke	General merchandise	50,000	40,000	Reduced by railroads and natural gas.
Wellsburgh, W. Va	73.8	Paper, glass, cotton, and woolen goods.	do	300,000	120,000	Chief industries of 1869 now much reduced.
Rush Run, Ohio	78.7	Country produce	do	10,000	15,000	
Warren, Ohio	80.8	Grain and produce	do	15,000	35,000	
Short Creek, W. Va	80.8	do	do	5,000	12,000	
Ohio River Coal Company	83.0	Coal	do	60,000	27,000	Reduced by rail competition.
Deep Run, Ohio	84.0	Whisky	Grain	5,000	5,000	
Slacktown, W. Va	87.5	Coal	General merchandise	10,000	7,500	
Martin's Ferry, Ohio	88.0	Iron manufactures, glass, and pottery.	Iron ore, pig metal, coal, etc	200,000	120,000	Do.
Wheeling, W. Va	90.0	Coal, iron, nails, glass, and general merchandise.	General freights	30,000,000	4,950,000	Reduced by rail competition and use of natural gas.
Bridgeport, Ohio	90.0	Coal and lumber	do	100,000	75,000	Do.
West Wheeling, Ohio	91.0	Paper, coal, barges, etc	Lumber, produce, etc	15,000	35,000	
Richietown, W. Va	91.5	Glass and iron	Ore and pig metal	50,000	65,000	
Benwood, W. Va	93.8	Iron and nails	Pig metal, etc	150,000	225,000	
Bellaire, Ohio	93.8	Glassware, nails, etc	Ores and general merchandise	175,000	325,000	
Belmont Coal Works	94.5	Coal	General freights	160,000	25,000	Reduced by rail competition.
Wegee Coal Works, Ohio	98.0	do	do	50,000	15,000	Do.
Limestone Quarries, Ohio	99.1	Limestone	do	5,000	12,500	
Moundsville, W. Va	101.0	Coal and produce	Groceries and general merchandise.	50,000	120,000	
Mineral Hill	104.0	Coal	do	30,000	45,000	
Powhatan, Ohio	110.7	Flour and produce	do	15,000	25,000	
Big Run, Ohio	110.8	Whisky	Grain	5,000	3,500	Distillery not in operation.
Hornbrook's, W. Va	113.0	Produce	General merchandise	15,000	25,000	
Whisky Run, W. Va	116.0	Whisky	Grain	50,000	65,000	
Sunfish, Ohio	116.8	Tobacco, flour, and produce	Grain, coal, and general merchandise.	100,000	145,000	
Proctor's Run, W. Va	121.0	Lumber, staves, and produce	do	20,000	75,000	
Bearsville, Ohio	125.5	Flour	Grain and general merchandise	20,000	45,000	
Martinsville, Ohio	127.0	Lumber, barges, etc	Lumber and general merchandise.	20,000	30,000	
Sardis, Ohio	130.4	do	do	10,000	25,000	
Lodi and Narrows Run, Ohio	131.6	Grindstones, staves, etc	do	10,000	15,000	
Barnes' Run, Ohio	132.4	Yellow pine and cooperage	do	10,000	25,000	
Whitten's Landing, Ohio	134.7	Produce and coopers' stuff	do	10,000	12,500	
Sistersville, W. Va	136.0	Oil barrels, flour, and produce	do	50,000	45,000	Reduced by rail competition.
Terrell's Landing, Ohio	136.4	Tobacco and produce	Coal	10,000	18,000	
Centerview, Ohio	139.0	do	do	15,000	25,000	
Matamoras, Ohio	141.5	Flour, produce, tobacco, and coopers' stuff.	do	65,000	135,500	
Grandview, Ohio	142.2	Oil barrels, flour, and produce	do	20,000	27,000	
Landing, W. Va	142.6	Lumber	Logs, etc	2,000	3,500	

Summary of the character and value of the Ohio River commerce by cities, towns, and principal landings, etc.—Continued.

Place.	Miles from Pittsburgh.	Exports.	Imports.	Estimated value in 1869.	Estimated value in 1886.	Remarks.
Johnson's Landing, W. Va	144.5	Country produce	General merchandise	$5,000	$12,000	
Union Landing, Ohio	145.2	Barrels, etc	do	2,000	5,000	
Wells's Landing, W. Va	146.4	Country produce	do	2,000	5,000	
Rea's Run, Ohio	150.3	Produce and coopers' stuff	do	10,000	15,000	
Landing, W. Va	151.8	Country produce	do	5,000	7,500	
St. Mary's, W. Va	154.5	Coopers' stuff and barges	do	30,000	45,000	
Newport, Ohio	155.5	Coopers' stuff and produce	do	5,000	12,500	
Newell's Run, Ohio	158.0	do	do	5,000	10,000	
Landing, Ohio	159.5	Petroleum oil transfer		10,000	8,500	Reduced by rail competition across river.
Cow Creek, W. Va	160.7	Country produce	General merchandise	5,000	2,500	Do.
Barker's Landing, Ohio	161.2	do	do	2,000	5,000	
Calf Creek, W. Va	161.8	do	do	2,000	3,500	
Sheets's Landing, Ohio	161.8	do	do	5,000	8,500	
Bull Creek, W. Va	164.0	Crude oil, lumber, etc		15,000	6,500	Reduced by rail competition.
Little Muskingum, W. Va	167.0	Lumber, etc		5,000	2,000	Do.
Marietta, Ohio	170.0	See Marietta statistics		2,500,000	475,000	Do.
Harmar, Ohio	171.5	Flour, tobacco, and grain	General merchandise	150,000	90,000	Do.
Williamstown, W. Va	171.0	Machinery, castings, and produce.	do	5,000	2,000	Do.
Finch's Landing, Ohio	172.5	Grindstones		5,000	1,500	Do.
Cole's Landing, W. Va	176.4	Produce, building stone, etc		5,000	2,000	Do.
Cutler's Landing	178.0	Grindstones and produce		5,000	1,500	Do.
Landing, Ohio	179.5	Building stone		5,000	1,500	Do.
Spencer's Landing, W. Va	179.7	Country produce		5,000	5,000	
Parkersburgh, W. Va	183.5	See Parkersburgh statistics		2,000,000	1,125,000	Do.
Belpre, Ohio	183.5	Flour and produce	General merchandise	50,000	50,000	Kept down by rail competition.
Hill's Landing, Ohio	189.8	Lumber, stone, and country produce.	do	3,000	5,000	
Walker's Landing, W. Va	192.8	Country produce	do	2,000	5,000	
Duke's Landing, Ohio	193.0	do	do	2,000	5,000

Landing, Ky.	955.0	Tobacco, hemp, etc.	do.	10,000	12,000	
Kelsey's Landing, Ill.	956.0	Grain and produce	do.	10,000	12,000	
Mound City, Ill.	959.0	Hulls, etc.	Lumber and general merchandise.	150,000	75,000	Do.
Cairo, Ill.	967.0	See Cairo statistics		20,000,000	7,729,202	Do.
Total trade of Ohio River by landings.				591,754,000	253,481,783	

COMMERCE BY RAIL AND FERRY, CROSSING THE OHIO RIVER AT POINTS NAMED, DURING THE COMMERCIAL YEAR 1886.

No branch of the present inquiry has presented such difficulties in procuring statistics as this respecting the amount, direction, and character of transfluvial trade carried into the States lying adjacent to the Ohio River. Chief of these difficulties has been the indifference shown by several railway lines most naturally interested in the scope and design of this report. A careful explanation of the facts desired from each company, together with an urgent request to be supplied therewith, has been preferred to all the roads engaged in a cross-river carrying trade, with the rather meager results presented in the following tables. Some of the more important lines failed to make any response whatever, others excused themselves by stating that their records were not so kept as to be rendered available upon the points desired to be covered here, while others still could only give in a broad and general way what would have been far more valuable in detail.

Credit should be prominently given to those lines which have endeavored to co-operate with the work of the Bureau, especially to the Louisville and Nashville Railroad Company, whose admirably kept tonnage statistics are models of their class, and probably are without a rival anywhere in this country.

The statistics collected are given in the order, as nearly as possible, in which the river is crossed by rail, beginning with Beaver, Pa., and following the river to its mouth.

Tonnage forwarded and received by the Pittsburgh and Lake Erie Railroad, passing over the Ohio River at Beaver, Pa., and average value of the same, from September 1, 1886, *to September* 1, 1887:

Classification.	Tons North.	Tons South.	Total.	Average value.
Miscellaneous	13,984	37,048	51,032	$10,206,400.00
Coal	1,039,467	53	1,039,520	1,039,520.00
Coke	338,366	.....	338,366	609,058.80
Iron and other ore	1,248	290,604	291,852	2,188,890.00
Pig-iron	199	64,512	64,711	1,423,642.00
Steel rails	27,449	3,398	30,847	1,064,221.50
Scrap iron	1,183	40,175	41,358	765,123.00
Other iron and castings	161,905	18,219	180,124	10,807,440.00
Cinder	32,084	2,353	34,437	98,145.45
Limestone	21	39,665	39,686	43,654.60
Other stone and sand	819	14,225	15,044	180,528.00
Fire brick and clay	1,967	5,077	7,044	56,352.00
Glass	14,877	929	15,806	1,580,600.00
Petroleum	6,710	1,379	8,089	161,780.00
Grain	207	12,140	12,347	246,940.00

* Estimated.

In addition to the foregoing there are, for the year 1886, 829,367 tons of south-bound freights and 77,203 north-bound freights received and dispatched at Cairo by other railroads. Besides this addition the total carriage of cross-river freights by registered ferry-boats must not be omitted from the general footing of this class of commerce, since, in most instances, the ferries are run in the interest of some more or less closely competing and connecting line of railroad where no bridge spans the river.

The final summary of cross-river freights may then be expressed as follows:

Total cross-river tonnage by rail (1886):	
North	3,267,723
South	3,622,292
East	1,732,380
West	5,324,245
Total cross-river tonnage by ferry-boat (1886)	156,685
Total tonnage (1886) by rail and ferry	14,103,328

At the very low valuation of $15 per ton, these freights would amount to $211,549,875.

These figures, however, by no means adequately represent the volume or value of this branch of commerce. In point of fact, at Louisville alone the railroads declining or failing to report their transportation business, which is carried across the river into or out of that city, would be amply able to raise the tonnage to nearly 20,000,000, and the estimated value to more than $300,000,000.

The figures presented show approximately the present volume of cross-river commerce under the most recent development of rail transportation, and represent quite clearly the tremendous competition with which the river interest has been struggling for its existence. When the littoral lines of railroad, notably those running between Wheeling and Parkersburgh, and now being extended rapidly to Huntington, and the line from Cincinnati to Huntington, on the Ohio shore, and the line along the Kentucky shore from Ashland to Newport, with the line from Madison to Evansville, Ind., and others now in active construction are considered, it will be seen that the river trade is on the eve of encountering still more formidable competition than it has previously had to meet on both sides between Wheeling and Pittsburgh. The problem to be solved in the near future is not so much what belongs legitimately to the river under favorable conditions, as what and how much it can economically hold against the encroachments of rail transportation.

These conditions have developed with river men a new system, practically, of doing business, which is most intelligently referred to by Superintendent Maxwell in a recent report to the Cincinnati Chamber of Commerce. He says:

"In late years there has been a general tendency to the solidification of interests, by which equally valuable results to shippers have brought to the owners of steamboat property wiser and more uniform management and better net returns. Moreover, the business has been transacted by a less number of vessels, which, being more promptly handled, has secured the performance of a given amount of work at a less expense, thus bringing a larger return to the owners of steamboat property. * * * With all the other great departments of production and trade seeking facilities for reducing the cost of doing business, and removing every useless expense in the hope of enlarging profits or saving from loss, it was natural that the steamboat interest, in the tremendous competition which was going on between it and the railroads, the latter having been for years devising every legitimate means for producing net revenue, should also turn its attention to the study of economy in its better sense."

As an example of the means adopted to bring about this new economy, the same reliable authority states that: "The Cincinnati, Portsmouth, Big Sandy, and Pomeroy Packet Company, the United States Mail Line Company, and the Memphis and Cincinnati Packet Company are now practically under one management, although maintaining separate organizations, the ruling interest virtually embracing 1,000 miles of Ohio River trade, and having an interest in 200 miles additional."

It is this compulsory pooling of interests that has contributed more than aught else to keep river traffic alive and prevented the same from being practically absorbed by the railroads. In other words, the system adopted by the coal companies of the Pittsburgh basins, has been extended so far as practicable to cover the ordinary merchandise transactions of the river, and the outcome promises for the latter what has been already realized by the coal interests. Left to itself, river commerce has shown a capacity for withstanding an almost unlimited amount of competition; but when the antagonism of rapid transit by rail is encountered the conditions are radically changed, and consolidation between rivalries otherwise safe becomes a matter of essential prudence.

CONCLUSION.

In concluding this report it will be proper to array the various portions by summaries in order to enable rapid comparison of the leading points sought to be presented. The following will be found to include everything essential to this end:

Number of boats and tonnage registered at Ohio River ports for the year 1886.

Class of vessel.	Number.	Tonnage.
Passenger steamers	158	47,924.13
Tow-boats	188	34,946.56
Saw-mill boats	9	509.78
Excursion and ferry boats	50	6,230.52
Total	405	89,610.99

Total weekly number of round trips, tonnage of freights, and passengers of boats registered at Ohio River ports for the year 1886.

Round trips	2,275⅞
Tons freight carried	45,551½
Number of passengers	36,538½

These figures do not include trips or tonnage of tow-boats in the coal and iron trade.

Amount of, and classification of freight, expressed in tons, carried up and down the Ohio River during the year 1886 *by boats registered at Ohio River ports, exclusive of coal and iron.*

	Up river freights.	Down river freights.	Total.
Live-stock	32,450	34,637	67,087
Grain	88,155	79,728	167,883
General merchandise	356,920	571,895	928,815
Total of freights			1,163,785

Value of freights under the foregoing classification, estimating live-stock at $75 per ton, grain $12 per ton, and general merchandise at $100 per ton, $99,926,621.

Summary of tons and values of coal, coke, and iron carried up and down the Ohio River in year 1886 *by vessels registered at Ohio River ports.*

Articles.	Tonnage.	Value.
Up river.		
Kanawha coal	1,275	$25,000
Iron ores and scrap	30,000	200,000
Down river.		
Coal:		
Pittsburgh	4,995,233	$6,000,000
Kanawha	1,500,000	2,000,000
Coke	318,800	700,000
Iron, rails	41,171	1,358,610
Total	6,886,479	10,283,610

General summary of tonnage and values of freights carried on the Ohio River during 1886 *by boats registered at Ohio River ports.*

Class of vessel.	Tonnage.	Value.
Passenger packets	38,244½	$99,473,587
Tow-boats	6,886,479	10,283,610
Ferries	7,307	453,034
Total	6,932,030½	110,210,231

It will be observed that there is a wide variance, amounting to $143,271,552, between the total estimated commerce of the river by cities, towns, and landings and the aggregate ascertained to be carried by boats registered at Ohio River ports. This is accounted for when the Ohio River carrying-trade of vessels registered at Nashville, Saint Louis, and other extra Ohio ports is considered. The trade of nearly all these vessels was found to be too irregular for close approximation, and that was the most to be expected of them in a statistical way. Enough was learned, however, of this class of trade in and out of the Ohio to justify a confidence that the addition of this element would bring the totals of commerce by cities, towns, and landings, and of boats registered for the Ohio River carrying-trade very close together in the estimates presented for 1886. Then the tonnage and values of lumber and timber rafted out of tributary streams and the traffic carried on by flat-boats, could this be estimated, would unquestionably make the two sets of figures coincide.

RIVER IMPROVEMENTS.

Upon this head descriptions and statistics will be best taken from previous reports made by expert engineers of the War Department, and from the record of appropriations made by Congress for the improvement of navigation on the Ohio.

The subject, so far as the improvements themselves are concerned, is purely a technical one, which belongs to the highest branch of engineering science, and is, therefore, better discussed by that class of authority.

The following extracts, taken from a special report made in 1870 to the Chief of Engineers of the United States Army, by Col. W. Milnor Roberts, civil engineer in charge of Ohio River improvement, though voluminous, have such an intelligent and direct relation to this subject that the reader will find them perhaps the best exposition of the several modes proposed for river improvement possible in the circumstances. It will be sufficient to say before presenting these extracts that the main conclusions of this expert engineer have been generally approved by the General Government, and some of them—notably in the case of the Davis Island dam—carried into practical operation.

Colonel Roberts says:

"Former reports to the Department made some years ago by different topographical engineers, and later reports made by myself, concur in the opinion that the system heretofore adopted to improve the navigation by means of riprap stone wing-dams concentrating and guiding the water into comparatively confined channels, although beneficial and useful, especially to the low-water navigation, does not meet the requirements understood as belonging to the radical improvement of the whole river. The present low-water system, it is true, does not involve a large expenditure of money. It does good and helps the navigation to a certain extent, at a small cost, and it can be effected in a short time, much of it in one or two favorable working seasons. But when finished, although it will be productive of public benefit more than commensurate with the outlay required, it will be no more than an amelioration of the present difficulty. All that has been promised or hoped for under this system, without the aid of artificial reservoirs, has been an increase of 12 to 18 inches in the depth of the low-water channels, making about 2½ feet where there was only 12 to 18 inches in the natural river. It is important to effect even this, and the whole amount of money required for this purpose is comparatively insignificant. But the public now using and interested in the navigation of this river is a much greater and more influential and more national body than the public that was concerned in it twenty-five years ago; and such improvements as were then satisfactory are now believed to be inadequate, even for the present river business, and not at all such as ought to be established in view of its future augmentation. Hence the question of its radical improvement is much more important now than it was a quarter of a century ago. The present interests involved are manifold greater, and it is quite obvious that nothing is likely to occur to prevent or seriously retard their future further rapid development and extension. So that if there are now six hundred millions of dollars' value of river commerce, as compared with fifty millions of former times, a few years only in the national life will elapse till there may be a thousand millions in place of the six hundred millions of value of the present time. The permanent improvement of a natural channel of commerce of such vast present and future importance may well command the careful study and attention not only of the Engineer Department, but of Congress and of the whole country. Plans which years ago may have appeared gigantic or disproportioned to the extent of the trade then interested may now be regarded as no more than appropriate to the magnitude of the new commercial necessities of the river. Yet, forty years ago, in the infancy of the internal-improvement system in the great States of Pennsylvania and New York, these single States did not hesitate to invest over $60,000,000 for State public improvements, and this expenditure has been abundantly repaid in the consequent development not only of the resources of those States but of the resources of the great West. For unquestionably it was largely, indeed principally, owing to the construction of the great canal and railroad thoroughfares through Pennsylvania and New York (afterwards materially aided by the opening of the Baltimore and Ohio Railroad) that the West and Northwest became so rapidly settled and developed in such an extraordinary manner. The fact, therefore, that it will cost a large sum of money to make of the Ohio River all that ought to be made of it as a great national commercial artery is not and probably will not be generally considered to be of such vital consequence as in early times. The particular mode of improving it in order to secure the best attainable result is of more real consequence than the cost of effecting such result. It may be conceded and understood in the outset that to accomplish the complete, radical improvement of the Ohio River will require a large expenditure.

"Of the several plans proposed it is believed that only one would secure the proper depth of navigation at all times without aid from artificial supply from reservoirs. The

plan of locks and dams, if the works were properly constructed, would, in my opinion, furnish the desired depth at all seasons without any artificial aid from reservoirs. The reasons upon which this opinion is based will appear further on. It is not mentioned here in the way of an argument in favor of that particular plan, but merely as an ascertained fact. The merits and demerits of this plan will be exhibited in this report.

"The plan of reservoirs as the sole means of supplying the Ohio River at all times with an additional flow sufficient to insure in low-water periods a depth of 5 or even 6 feet originated with Charles Ellet, jr., esq., civil engineer, and was very beautifully elaborated by him in various publications, and thirteen years ago its adoption was strongly urged upon the country. His plan contemplated no work upon the river itself, the idea being to accumulate large quantities of water in reservoirs upon the headwaters, or on the main streams above the head of the Ohio, to be drawn off and allowed to flow when needed to maintain the proper depth of the main river. No special surveys were made for the purpose of determining the number and locations of the reservoirs contemplated on this plan. Daily observations had been made through a series of years of the depth of the flow in the channel at Wheeling. From these Mr. Ellet deduced by calculation the theory that enough water falls upon the territory drained above Wheeling, if it were equalized throughout the year, to make a constant depth of over 7 feet in that channel. He found by calculation the probable quantity of water required to be stored up in reservoirs sufficient to maintain a depth of 6 feet through the low-water periods. He also made some personal examinations along the upper portions of the Allegheny River and obtained considerable information from various sources respecting elevations of different parts of the region in question, all of which enabled him to present his views in very attractive forms, both to the scientific world and to the general public. The practical merits of this plan of reservoirs will be considered in another place in this report.

"A third plan for the improvement of the river was proposed by Herman Haupt, esq., civil engineer, in 1855, which consists of a system of longitudinal mounds and cross-dams so arranged as to make a canal on one side of the river about 200 feet wide, or a greater width, and reducing the flow to nearly an average of, say, about 6 inches per mile between Pittsburgh and Louisville. Thus, instead of a series of natural pools and ripples, which now constitute the general regimen of the river, this plan would change it, on a width of 200 feet or more, to an equable flow due to the general average declivity of the stream.

"Mr. Haupt's calculations showed that in extreme low-water stages there is not water enough flowing naturally to maintain the full required depth in such a channel; that some additional supply would be needed from reservoirs; very much less, however, than the quantity necessary to maintain a similar depth in the unobstructed river on Mr. Ellet's plan.

"A fourth plan has been proposed by Alonzo Livermore, esq., civil engineer, the principle of which he secured by patent in 1860. It is a combination of dams and peculiar open chutes through the dams, arranged so as to retard the flow and lessen the velocity of the water from the upper to the lower pool without interfering with the free passage of boats through the chutes; the *chutes* being substituted for *locks*. This may be regarded as another method or substitute for the open canal and dams which had been proposed by Mr. Haupt as a means of saving water on the reservoir plan. For a certain width of chute, say 100 feet, the natural low-water flow on Mr. Livermore's plan is deemed sufficient without the aid of artificial reservoirs.

"It is proposed to consider each of these four proposed methods of improving the river in the order in which they are already referred to, premising that this order or arrangement has no reference whatever to the respective merits of the different plans, but arises naturally in connection with the periods when the several plans were publicly promulgated. I should further remark here that although the writer early advocated the idea of the probable future construction of a lock-and-dam system for the Ohio, while engaged as engineer in constructing the Monongahela steam-boat navigation in 1839, he has never been so wedded to that particular mode or to any one plan as to hinder him from presenting all plans in an impartial manner to the consideration of those who, with every wish to know their merits, could not be expected to take the time to examine fully for themselves, So that, in entering now upon a reinvestigation of this subject, I am by no means sure which plan, as a whole, may ultimately be deemed most advantageous. It is due to myself, in connection with so grave a question, to state further that at no time during former examinations into the merits of the different plans did the writer feel warranted in recommending without more investigation the adoption of either of the modes proposed.

"Within the last ten or twelve years, since there has been any practical movement looking to the immediate radical improvement of the river, essential changes have taken place in the mode of using it, as particularly referred to in my report of December 20, 1866. I allude now especially to the tow-boat system, under which a new class of nu-

merous powerful steamers, running only during coal-boat freshets, has been introduced, in connection with *coal-barges*, which have been substituted for the old-fashioned frail coal-boxes. This is considered a great improvement upon the former rough, irregular mode of conducting the coal business, although it is still quite irregular as to the periods of running, being wholly dependent on freshets, which do not occur at regular intervals; consequently there are some eight to ten millions of dollars of permanent capital in the the shape of steamers, barges, fixtures, mines, etc., always liable to lie idle with loaded coal-barges, subject to long delays between floods. And it is not merely this permanent capital that is thus subject to the capricious flow of the stream; large quantities of coal standing loaded in the barges, involving sometimes half a million of floating, unproductive capital, under more or less risk, and the cost of taking care of five millions of dollars' worth of steamers and barges during these worse than idle intervals, entail a heavy tax upon this large and growing interest, already having attained to the shipment of over forty-five millions of bushels annually from Pittsburgh alone. These tow-boats, the empty barges, and all considerable steamers are compelled to withdraw from the river trade when the water falls below 3 feet in the channel; then a smaller class of vessels may still continue to navigate till the water falls below 2 feet depth. Very light-draught steamers may run even when there are not more than 18 inches depth in the channels. But since the completion of numerous railroads in Pennsylvania, Ohio, Virginia, Kentucky, Indiana, and Illinois, so situated as to accommodate to a considerable extent the general travel and much of the lighter trade, it has not been found profitable to run the river when it falls below a 2-foot stage, and comparatively little is therefore attempted at such times.

"A constant, reliable navigation, which should never be less than 5 feet deep at extreme low-water periods, which could usually be 6 feet or more, and which should afford, in times of freshets, a navigation as good as we have now in similar freshets, is the great desideratum. This, it is believed, can be effected by the liberal expenditure of money. The necessity for some radical improvement, and its expediency, seem to be generally conceded, provided it can be effected in a satisfactory manner, on such a plan as will command general confidence. Objections will be made to the adoption of any plan, some of which objections may be well founded because it is hardly to be supposed that either plan in its construction will not injuriously affect, more or less, some private interest, private views, and present private arrangements. No great scheme designed for general public benefit ever yet escaped objections of some sort.

"In the present consideration of the several proposed plans it is important, therefore, to refer to all known objections and to take into view all such probable objections as have occurred to those who have carefully reflected upon this subject. The different plans may then be presented under these general heads: Plan; original estimated cost; time of completion; annual cost of keeping up, including attendance; duration of original works; effect on navigation during construction, etc.; risk and effect of accident; general objections; general advantages; together with such views and opinions as may naturally arise during the investigation.

"Locks and Dams.

"THE PLAN OF LOCKS AND DAMS.

"At the present day, owing to the increase in the size of steamers, especially those navigating the Lower Ohio, and at times the entire river, larger locks than were used or contemplated some years ago have been deemed necessary. The largest lock at present in use on the Monongahela steam-boat navigation has a chamber 250 feet by 56 feet, and will pass a boat 240 feet long and nearly 56 feet wide. The new locks at Louisville have chambers 370 by 80 feet; large enough to pass boats 340 by 79 feet. Even these very large dimensions are not sufficient to pass boats that are occasionally built at Pittsburgh, destined for the lower rivers. But it would be a waste of money and very bad engineering to construct locks of enormous and unwieldy size merely to say that they were as large as the largest river steamers in the world, when obviously those vessels would never use them and never have occasion to use them.

"Steamers of this immense size will not go down the river excepting when there is such a freshet as would enable them to pass any such dams as should be admitted on the river even in a "lock-and dam" system. I mean by this that in my opinion no dams ought to be constructed in the Ohio River without being provided with chutes so arranged that in a moderate flood vessels could safely pass the chute without being compelled to go through the locks; such chutes, or navigable freshet channels through the dams, being assumed to constitute on the Ohio a necessary part of any proper system of locks and dams. The locks need not be constructed of such extraordinary dimensions. For example, the coal business is done upon a freshet, giving say 8 feet or more depth

in the natural channel; let the dam be so built that the chute through it shall afford nearly or quite the same depth of channel at such stage of the river. In that case the locks need to be only of sufficient size to accommodate steamers particularly adapted to the general business of the river. If all the locks of the system were to be erected, at great extra cost, large enough to pass the largest Lower Mississippi steamers, of which only a very few, if any, would ever use them, there would be a very great loss of time always to all the numerous smaller steamers using such unwieldy locks, and an unnecessary constant additional cost or tax in loss of time upon the general river commerce. In this view a lock considerably smaller than the new locks at Louisville might be practically better under the circumstances; at least above the falls, in the event of the adoption of locks as part of the system.

"The general plan for locks and dams, according to these views, would be a medium size of lock, having dams arranged with freshet chutes, such as could be easily navigated in a coal-boat rise.

"The fall of the river between Pittsburgh and Louisville, on a distance of 598 miles, is 308 feet; and between the foot of Louisville falls and Cairo, a distance of 365 miles, is 92 feet. The "falls," 3 miles in length, have a vertical descent of 26 feet; but this may be considered as already covered or provided for by the new, partially-built canal and locks.*

"Practice of long experience seems to have established about 7 or 8 feet as a convenient working lift for large locks and dams. I would not recommend the adoption of greater lifts for locks on the Ohio River intended for general business, in view of maintaining a safe navigation in moderate freshets over or through the chutes of the dams. Locks of less lift, and consequently dams of the same reduced lift, would afford an equal depth of navigation with a somewhat smaller quantity of lockage water; but the number of locks and dams would be proportionally increased. Thus between Pittsburgh and Louisville, where there is a total fall of 308 feet, the number of locks and dams, allowing about 8 feet lift to each, would be 38, while with about 6 feet lift the number would be 51. The cost of the larger number, with lower lifts, would be considerably more than the cost of the 38 with the 8-foot lifts. It is also true that if the lifts were made still higher, and the number of locks and dams thereby diminished, the original cost would be reduced; but if the height of the dams should be established materially above 6 to 8 feet, the quantity of water required to make the chutes navigable would be much greater, and that particular plan would probably fail. I therefore assume 8 feet as the highest advisable limit, and 6 feet as the least advisable lift that ought to be considered in this connection. If 6 feet be assumed, it would require 51 locks and dams between Pittsburgh and Louisville; and for a similar improvement between Louisville and Cairo, 15 locks and dams; in all, 66 locks and dams.

"In general, in most streams, dams should be located where the stream in the vicinity is the widest, thus affording the greatest extent of river for the discharge of floods, and lessening the injurious effect of freshets; but on the Ohio, with dams of not over 6 feet lift, making the comb of the dam only about 13 to 15 feet above the bed of the river, the effect of the dams on the high floods of the Ohio River would be very slight, and practically of no account; and for moderate freshets there would be no particular advantage in lengthening the dam. But while presenting this point I do not think it necessary to regard it as very important or as a matter considered either way that would materially affect the estimated cost of the improvement. In a stream like the Ohio, where floods rise to the height of over 30 feet at Pittsburgh, over 40 feet at Wheeling, and over 60 feet at Cincinnati, and in which 30 feet floods along the river are quite common, an additional rise of a foot or two, at most, that might be caused by moderate freshets by the dams, could not possibly be of much practical consequence, and in the great floods the effect of the dams would be imperceptible.

"In making an approximate estimate of the cost, we may then assume, as above, 66 locks and dams, averaging about 6 feet lift each, for the whole of 967 miles; and the averaged length of dam on the Upper Ohio at 1,300 feet, and on the Lower Ohio at 2,200 feet, or an average of about 1,474 feet, or allow 1,500 feet each for the 66 dams, allowing 300 feet besides at each to be occupied by the lock and walls. This would be sufficiently near for all present generalizing purposes. Above the Falls of the Ohio, locks, one with chamber 370 feet long and 80 feet wide, the other 300 feet long and 60 feet wide at each dam, may be assumed as approximating nearly enough to the dimensions that may hereafter probably be deemed the most advantageous, considering all circumstances. Below Louisville the present calculations may also be based on locks of the same size as the new locks at Louisville, although I am not now prepared to recommend that size for actual adoption above Louisville. Even if locks and dams should hereafter be selected as the best thing for the Upper Ohio, it would not necessarily follow that they might be the best for the river below Louisville. But the discussion or settlement of such

*Since completed and now being further enlarged and improved.

points belongs to a more advanced part of this report, the immediate object in this place being merely to obtain, approximately, the probable cost of some reasonable system of locks and dams for comparison with the cost of other plans.

"For convenience of future reference it will probably be advisable to refer to the Upper Ohio separately. The difficulties of the navigation below Louisville are confined to comparatively few places, and the general regimen of the river is sufficiently different to warrant this separation. For present comparison, therefore, the estimates of all the plans may be confined to the 598 miles between Pittsburgh and Louisville on the Upper Ohio, where the fall in the river is 308 feet, which, on the plan of locks and dams, would require 51 dams of about 6 feet lift; the dams assumed to be 1,300 feet in length, clear of the lock walls; the lock walls to average about 8 feet above the comb of the dam at the chamber, and 10 feet at the head. So that, whenever there should be a freshet flowing 8 feet deep over the comb of the dam the pools would be nearly equalized, affording a safe navigation of 8 feet over the dams, when the locks would be submerged (even if there were no chutes in the dams). A depth of 8 feet and upward on the comb of the dam would submerge the lock and render it, for the time, useless, till the flood should recede to less than 8 feet depth on the comb; but with the chute arranged either near the lock or at some other convenient place in the dam, a safe navigation through it could be securred with even less than 5 feet depth flowing over the comb of the dam. This, however, is a secondary or a subsidiary matter, which does not necessarily appertain to the ordinary plan of locks and dams, which could of course be constructed without freshet chutes. All such works will cost much more now than they would have cost ten or more years ago, and it is not probable that lumber, iron, and stone-work which constitute the leading items, will ever be done as cheaply as formerly. At present the average price of lumber rates about three times as high as it did twenty years ago, and iron-work and stone-work nearly or quite double the old prices. Possibly before the works could be executed prices may fall materially. I present the following as an approximate estimate of the cost of the 2 locks and 1 dam, with the large dimensions assumed, namely: lock-chambers, one 370 by 80 feet; the other 300 feet by 60 feet; 7 feet depth of extreme low water; 6 feet lift, and 4 feet guard. Walls at lower gate 8 feet, at upper gates 10 feet above comb of dam. Locks, walls, and abutments of regular coursed, hammer-dressed stone, laid in cement.

"Dam 1,300 feet long, average height to be built, say 15 feet, allowing 2 feet extra over the 13 feet. Base of dam 54 feet, lower slope about four to one, upper slope about three to one. The dam to be composed of timbers averaging not less than 10 by 12 inches square, the cribs filled with rough stone, sheet-piled on the upper toe, and made water-tight on the upper slope with jointed planking, and in part graveled to tighten it and prevent undermining.

"*Estimated cost of two locks.*

38,400 cubic feet of timber in lock foundations, etc., at 20 cents per foot	$7,680.00
276,000 feet, B. M., plank, including sheet-piling, at $40 per M	11,040.00
22,400 pounds iron bolts, spikes, etc., at 15 cents per pound	3,360.00
10,200 cubic yards first-class rubble masonry, at $11 per cubic yard	112,200.00
8,410 cubic yards pit excavation, at $1 per cubic yard	8,410.00
4,400 cubic yards excavation for head walls, etc., at 40 cents per cubic yard	1,760.00
8 lock gates and fixtures, at $3,500 each	28,000.00
Fender cribs at locks	2,000.00
Lock house	1,500.00
	175,950.00
Add contingencies and engineering, 10 per cent	17,595.00
Total cost	193,545.00

"*Estimated cost of dam and chute.*

"1,300 feet long; 15 feet high; 54 feet base.

60,000 cubic feet of timber, at 25 cents	$15,000.00
385,200 feet, B. M., plank covering and sheet-piling, at $40 per M	15,400.00
72,200 pounds iron bolts and spikes, at 15 cents per pound	10,980.00
4,600 cubic yards of excavation, at $1 per cubic yard	4,600.00
3,200 cubic yards of excavation, at 50 cents per cubic yard	1,600.00
21,400 cubic yards stone filling, at $1.50 per cubic yard	32,100.00

Estimated cost of dam and chute—Continued.

11,760 cubic yards of graveling, at 50 cents per cubic yard	$5,880.00
5,400 cubic yards of embankment, at 30 cents per cubic yard	1,620.00
1,174 cubic yards of rubble abutment, at $10 per cubic yard	11,740.00
	98,920.00
Add contingencies, 10 per cent	9,892.00
	108,812.00
Add estimated cost of chute	32,000.00
Total estimated cost	140,812.00
Estimated cost of two locks	193,545.00
Estimated cost of dam and chute	140,812.00
Total estimated cost of locks, dam, and chute	334,357.00

"This sum, $334,357, multiplied by 51, the number assumed between Pittsburgh and Louisville, gives $17,052,207 as the total estimated cost of the improvement on this distance of 598 miles, or at the rate of $28,516 per mile. Applying the estimate to the whole river, inclusive of the "Falls," there would be—

Points which at $334,357 is	$22,067,562
Add for extra length of dams below the Falls	710,100
Add for completing locks and canal at Louisville	1,000,000
Total for 967 miles	23,777,662

Or at the rate of $24,589 per mile.

"There is nothing in the nature of the structures to require more than two working seasons for their completion. It may be considered that at least two years would be required for the opening of the entire navigation, after the final surveys and location of the works. Whether it would be advisable to pursue the plan of completing all within the brief space of two years, is a question by itself, which need not now be discussed; and not at all, unless this particular mode of improving the river should be adopted.

"ANNUAL COST OF KEEPING UP AND ATTENDANCE.

"Under the head of annual repairs may be included the cost of renewing the wood and iron work exposed to wear and decay, applicable chiefly to the lock-gates. Portions of the wood and iron work of the locks and dams, always under water, and not subject to wear, will of course last much longer than the upper part of gates exposed alternately to wet and dry.

"Dams on the Ohio, if faithfully constructed, need not become actually dry at any time, and ought not to be considered subject to decay, excepting so far as timber and iron constantly under water may be liable thereto. They will last longer than dams on many other streams which have a much smaller minimum flow of water, thereby causing them to be occasionally dry.

"I think it will be safe to allow an average of ten years as the life of the wood-work and iron-work of the lock-gates, which are specially subject to wear and to the action of the weather. Lock-gates constructed wholly of iron may be substituted for the wood-and-iron gates, but they would cost much more. They might be composed of thin double plates made hollow and strengthened with interior braces and stays, and built air-tight, so as to lighten them by their buoyancy when in the water; but the present calculations are based upon ordinary wood-and-iron gates. At the dams, ordinarily, no work of consequence would be required for many years, unless in cases of extraordinary injury from floods, which is of course possible, and which it is proper to consider in the estimates of repairs, extending the estimate through a period of twenty years.

"*Estimate of repairs and attendance.*

One dam and double locks for twenty years:	
Two renewals of eight gates, at $7,000 per gate	$56,000
Renewal of parts of dam equal to half of original cost, and covering superintendence and extraordinary repairs	70,000
Cost of two lock-tenders, at $2,000 per year	40,000
Cost of two assistants, at $1,000 per year	20,000
	186,000
Divided by 20, gives per annum	$9,300
Which sum of $9,300 multiplied by 51, the number of dams between Pittsburgh and Louisville, gives annually on these 598 miles	474,300
And on 66 dams between Pittsburgh and Cairo, gives annually on 957 miles	613,800

"The above amount of approximate estimated cost is deemed ample to cover all probable contingencies. Supposing it should cost three-fourths of a million dollars per annum to keep up a perfect navigation, that amount would be saved several times over, as already indicated, even on the business that could be relied upon as soon as the works could be completed. How cheerfully ought that to be paid by those having the benefit of such an improved navigation

"DURATION OF THE WORKS.

"In regard to the duration of the works, the foregoing estimated annual cost, judiciously applied, would, it is assumed, maintain them always in order, so that they might be regarded as permanent.

"EFFECT DURING PROGRESS OF CONSTRUCTION.

"In regard to the effect on the present ordinary river navigation during the construction of such works, experience elsewhere has shown about what it will be under proper arrangements. The locks can be built without any interference with the navigation during their erection. The dams will interfere with it for a short time, but with proper management, and by timing the completion of the locks so as to have them entirely ready for use before the middle opening left in the dam for the ordinary navigation is closed, very little delay need occur between the stopping of this temporary sluice-way and the opening of navigation through the lock. And in case navigable freshet chutes should be constructed in the dams; the actual delay might be somewhat less. In any case the final closing of a dam ought to be so managed as not to stop the passage of boats of light draught more than forty-eight hours. They should, of course, be closed when the river is in a comparatively low stage, and at such periods very few boats now navigate the river. It is obvious, therefore, that ordinarily the delay to be necessarily caused by the completion of a lock and dam, under skillful management, ought not to be a serious matter. At the same time, under careless or ignorant management the delay might be considerable. It is hardly presumable that the construction and care of works of such importance would be intrusted to incompetent or inexperienced hands. On the whole, it is only reasonable to assume that no serious objection to the plan of locks and dams, as compared with other plans, can be maintained on the score of interference with the navigation during their construction.

"RISK AND EFFECT OF ACCIDENTS.

"The risk of accidents and the effect of accidents are both worthy of serious consideration. Dams, although they may be well planned and faithfully constructed, are, of course, subject to injury. Those which may be founded on rock bottoms will be almost free from the risk of damage; but of those which must be founded on gravel, or gravel and sand bottoms, the majority will be more or less liable to settle from undermining that may be caused by the digging out of the bed of the stream and dropping out of the stone filling. This, while it will create extra expense of repairs, need not necessarily interfere with the navigation, especially in dams arranged with navigable chutes. An accident to a dam, if any occurred, would naturally take place in the time of a freshet, at which time the sinking of the dam could not injuriously affect the navigation, either over the dam or through the lock. After the subsidence of the flood, in the low-water period, in case the dam should settle materially, it might for a time draw down that

particular pool so as to leave an insufficient depth at the outlet lock on the upper end of the pool; but the remedy in such a case is usually neither difficult nor very expensive. Unless the injury should be much more serious than may reasonably be apprehended, and to which faithfully constructed works would not probably be liable, the navigation would be maintained, either through the chute or through the lock. In case the dam, or a considerable portion, should be completely carried away—a circumstance though possible, yet highly improbable—the river for the time might be even then better for navigation than in its natural state, before the introduction of the system, because the backwater from the next dam below would raise the water somewhat above its original low-water elevation at the injured dam. If two adjoining dams, however, should meet with the same sort of mishap, then the water below the upper of the two would stand at its old natural stage; there would be no navigation through the lock, and only such as the chute would afford through the dam above.

"It can not be said that such accidents are impossible; but the experience of over a quarter of a century on the Monongahela steam-boat navigation shows that the possibilities are against their occurrence. At some dams the water may cut out the bed of the river immediately below to a greater extent than at others. In similar cases, where deep holes have been thus excavated, it has been found that the insertion of cribs filled with stone serves to prevent all further danger from such cause. In estimating the cost of repairs and renewals, it is, of course, proper to make an allowance for contingencies of this nature, but it is not apprehended that a navigation thoroughly constructed on the system of locks and dams would be seriously interfered with from failure of the dams.

"The locks, when properly planned and substantially erected, are not liable to material injury. The only parts exposed to actual damage from high floods which would submerge the locks are the gates. Experience on the Monongahela and other steam-boat navigations, in Kentucky, etc., has demonstrated that no very material obstruction to the navigation has ever arisen from this cause. Lock-gates thus exposed have very rarely been materially injured by floods. Sometimes sediment, logs, etc., settle in the locks or above the upper gates during the submerging floods, which afterwards cause some temporary delay, but for the most part these logs, etc., pass over the dams without affecting the locks. Still, it is an objection that there should be any such liability to detention. Through active measures on the part of superintendents the locks could be put in working trim generally by the time the flood had so far subsided that steamers could no longer navigate over the dam or through the chute.

"The lock-gates are also liable to injury through the carelessness of steamboatmen or other boatmen running their craft violently against them. In thirty years on the Monongahela navigation there have been but two occurrences of this kind of accidents. Still such accidents may happen.

"The best remedy known to me in case of accidents of this nature, is to have several finished lock-gates always on hand at a few convenient points along the river, which could be immediately sent to the spot and substituted for the injured gates. All the locks having the same size and lift at each dam, the gates on hand would fit at any of them. This is also an argument for building them all of similar size at each dam on the Upper Ohio, or at least on any considerable stretch of continuous navigation. An accident of the worst kind, such as happened once on the Monongahela navigation, ought not to cause a delay greater than that one, which was four days; but, with navigable freshet chutes, such delay could only occur during periods of low water, as at other stages the steamers, etc., could pass through the chutes or over the dams.

"After all, however, the objection must stand that dams and the lock-gates are liable to accidents from the effect of floods and from injury that may be caused by careless steamboating; but, with double locks, the risk of a serious stoppage of the navigation is greatly reduced, it being improbable that both locks would be disabled by one accident, or both at the same time.

"In connection with a navigation involving locks, it may be proper to refer to a plan with single locks, with a more elaborate and more costly chute in the dam, which would afford a safe chute navigation for about eight or nine months of each year. It is possible that dams can be so arranged with chutes with gates which can be conveniently managed on a channel width of 300 feet or more; which gates should be submerged and entirely out of the way of boats, ice, logs, etc., until required to be raised on account of low water, when there would be only a lock navigation, and which could be readily and quickly let down in case of freshets. In case of the adoption of such a system of navigation it might possibly prove to be advantageous to reduce the fall at each dam to about six feet. This would increase the number of dams between Pittsburgh and Louisville (598 miles) to 51, as already shown; and between Louisville Falls and Cairo (366 miles) to 15, making 66 in all.

"The first cost of an improvement of this character would not be greater than the estimate already submitted for the double locks with dams of 6 feet lift. The cost of keeping it up might be somewhat increased. It is not deemed necessary in this place to

pursue this further in detail, as it can only be regarded as a modification of the plan of a lock-and-dam navigation, which of course would be of no practical account if locks should not form part of the system finally adopted. It may perhaps be referred to more particularly in the sequel.

"SUPPLY OF WATER ON THE LOCK-AND-DAM PLAN.

"Experience on the Monongahela steam-boat navigation having demonstrated that occasionally, in seasons of excessive drought, the water supply on that improvement has been inadequate, it has been assumed by some intelligent gentlemen that the supply might also at times fall short on the Ohio if it were made into a slack-water navigation.

"In 1838, a season of remarkably low water, the Monongahela at one time furnished only 4,500 cubic feet per minute, and the Alleghany, at the same period, 80,000 cubic feet per minute, or eighteen times more than the flow of the Monongahela at that time; making, at the head of the Ohio, 121,680,000 cubic feet per day. Mr. Ellet's calculations of the low-water flow, with only one foot depth in the channel at Wheeling, was 102,000,000 cubic feet per day. This, it may be assumed, is the minimum flow of an occasional year. In general, there is no period of the year when the flow is not more. But even taking one-fourth from this minimum of 84,500 cubic feet per minute, and allowing that there may possibly be periods of extreme drought when the flow of the Ohio River at Pittsburgh should be no more than 63,375 cubic feet per minute, or 91,260,000 cubic feet per day, it would still be ample for the slack-water navigation. Assuming, for a safe calculation, double locks of large size, both with chambers 370 feet by 80 feet, and 6 feet lift of lock, the quantity required for a single lockage is 177,600 cubic feet. Allowing one lockage every ten minutes during the whole twenty-four hours, or 144 lockages per day, the quantity consumed in lockages would be 25,574,400 cubic feet, which, deducted from 91,260,000, leaves a surplus of 65,685,600 cubic feet. This surplus is much more than enough to cover the leakage at the dam and locks, and the evaporation of the pool. And it may be safely assumed that the first pool, at Pittsburgh, being thus amply supplied, the additional evaporation on the pools below will be more than kept up by the flow of the numerous tributaries discharging into the river; and consequently that there could be no scarcity at any time for navigation purposes on any portion of the improvement. It must be a very imperfectly constructed dam that should leak even as much as the lockage water above assumed, that is, 1,065,600 cubic feet per hour, or about 8,000,000 gallons per hour. Yet, if it leaked that quantity there would still be a surplus of 40,111,200 cubic feet per day. Now, the lower dam on the Monongahela improvement is 1,100 feet long, and in low water it has 9 feet lift, and yet in ordinary low water there is a sufficient supply for navigation purposes. It is fair to assume that the leakage on the Ohio River at one of the dams would be no more than at the Monongahela dam; for, though the average length of dam may be one-fifth or one-sixth greater, the lift being but 6 feet instead of 9 feet, owing to reduced pressure, will more than compensate, in reduced leakage, for the additional length. If, therefore, a navigation in ordinary low water can be maintained at all on the Monongahela with a low-water flow of certainly not more than one-eighth of the low-water flow of the Ohio, it can scarcely be doubted that slack-water navigation on the Ohio will have an abundant supply of water always.

"While it is proper thus rigidly to investigate the extreme case of the period of greatest drought, such as occurs only at intervals of a number of years, it would not be reasonable to assume it as the regular annual low-water stage, for during six consecutive years, from 1843 to 1848, inclusive, there was but one month of the year, August, 1843, when the average flow on the Wheeling bar was (a trifle) less than 2 feet depth; and but two other months, August, 1845, and September, 1848, when the average flow was less than 3 feet. With 2 feet on the bar, the average flow was calculated to be 228,000,000 cubic feet per day, and with 3 feet on the bar, 400,000,000 cubic feet per day. During the memorable drought of 1838, there was a period of 120 consecutive days when the depth on the bar at Wheeling was less than 5 feet. The actual average daily discharge during these 120 days was about 220,000,000 cubic feet; so that, notwithstanding there may be a few days, or even a few weeks, occurring, however, at intervals of several years, when, owing to extreme drought, the flow in the upper part of the Ohio may fall as low as 80,000 cubic feet per minute, such a circumstance is very rare. It is doubtful whether there have ever been 30 consecutive days when the flow in the Ohio above Wheeling would have averaged as little as 80,000 cubic feet per minute. Yet even this minimum quantity gives 115,200,000 cubic feet per day, and it is therefore no more than reasonable to consider, in connection with a slack-water navigation, the usual natural low-water supply as equivalent, in round numbers, to 100,000,000 cubic feet per day at the head of the Ohio.

"In the preceding calculations of the number of lockages it will be observed that a lock is allowed to be filled and emptied every two minutes throughout the twenty-four hours,

and this during the extreme low-water period. Admitting as possible that an improved navigation may so equalize the business of the year as to have as many vessels passing during the low-water period as at any other seasons of the year, the amount of trade to be accommodated by the passage of 144 lockages will be truly enormous. Allowing but 500 tons to pass at each lockage, it would give 72,000 tons per day; and allowing only 300 days of navigation per annum, it would be 21,600,000 tons. This vast tonnage is probably more than five times as much as has ever yet passed any point in a year on the Ohio River. Even with the most perfect navigation possible a great many years must elapse before a trade so immense could accumulate. This fact is referred to pointedly in this connection, in order to show clearly that very liberal allowance has been made for the probable consumption of water, and even with such allowance the supply from the natural flow in the driest season appears to be abundant; for, if the very lowest assumed minimum quantity in any one day of extreme low water, namely, 63,375 cubic feet per minute, be taken as the only supply all the year round, it will be found to be far more than sufficient for slack-water navigation, even with this enormous trade. It should be considered, also, that with a business of such magnitude as to demand a lockage every ten minutes, or 144 lockages per day, the lockages alone would make a respectable stream of water sufficient to maintain the pools ever fresh. This calculated quantity of lockage water per day, 25,574,400 cubic feet, thus locked through, would make a constant flow 100 feet wide, 1 foot deep, running at the rate of 2 miles an hour; while the quantity remaining to cover leakage and evaporation would be more than double of this flow. The remaining quantity, 65,685,600 cubic feet per day, or 2,653,564 cubic feet per hour, is equivalent to a flow 125 feet wide, 2 feet deep, running 2 miles an hour. So far, therefore, as such an important matter as the supply of water for a permanent lock-and-dam navigation can be ascertained in advance, the conclusion is that there will be water enough at all times, always an ample and generally a superabundant supply. Additional details concerning the flow of the Ohio in its various stages will appear in considering the reservoir.

OBJECTIONS ON ACCOUNT OF ASSUMED INCREASED HEIGHT OF FLOODS.

The first and natural impression of persons who have not had experience in the construction and effect of dams in large streams is that after their erection the floods will be materially augmented in height in consequence of the dams. Yet abundant experience has demonstrated the contrary. The Monongahela River presents the greatest resemblance, in times of floods, to the Ohio, especially to the middle Ohio below Parkersburgh, where the fall per mile is nearly the same, namely, about 6 inches per mile. The dams on the Monongahela were built about 15 feet high, above the old natural bed of the stream, and so that when finished the vertical fall was about 8 to 9 feet from pool to pool. Dam No. 1, situated a short distance above the head of the Ohio, at Pittsburgh, is 1,100 feet long, about one-fifth or one-sixth less than the assumed average of those required on the entire Ohio. All of the four dams below Brownsville are built on gravel foundations, and consequently are as much exposed to damage from floods as any of the dams on the upper Ohio would be, as they would all have either rock or gravel foundations. The lower dams, the two longest on the Monongahela River, were built thirty years ago, so that ample time has elapsed to test in a practical manner most of the questions appertaining to structures of this sort. We have in this case thirty years of actual experience, which confirms, to the fullest extent, the views expressed in official reports by the writer prior to the erection of those dams, as to the apprehended additional rise of floods.

Sylvanus Lothrop, esq., who was afterward the chief engineer of the Monongahela slack-water navigation for some years, stated in his annual report, in 1846, as follows:

"The principle which has heretofore generally been admitted is now ascertained by actual experience and observation to be correct, that whenever the waters of the Monongahela swell to an elevation of 8 feet upon the combs of the dams, they then cease to back the water, and the flood is no higher in consequence of their erection. The fall being then distributed along the pools, and the surface nearly equalized, both above and below, they can be passed in either direction by steam-boats of the largest class employed in the trade, without hazard or delay."

From my own personal observations during the past three or four years on the same navigation, I am enabled to vouch for the truth of the foregoing statement in every particular, and it conforms precisely to my experience on many other rivers uponwhich I have constructed dams and studied their effects.

Neither observation nor complaint has shown that the great floods on the Monongahela are any greater now than they were before the construction of the dams. Any one along the river can now observe, as it occurs every year, that when the floods rise so as to make a depth of about 8 feet on the comb of the dam, the flow in the stream is nearly

equalized, the water, of course, passing more swiftly at the dam, where it is shallowest. With 10 feet depth on the dams the river flows along, both above and below, much the same as it would without them. Hence, it is reasonable to conclude from experience, as fair calculation will also show, that in the Ohio River, where floods of 30, 40, and even 60 feet occur, the additional height caused by dams only 6 feet high from pool to pool will be entirely insignificant, and practically of no account in their effect upon great freshets.

In erecting dams of 13 to 15 feet height above the average bed of the stream a few instances may occur where small areas of bottom land of little value may be permanently overflowed; but from former experience on the Monongahela, and from personal knowledge of the Ohio River and its bottom lands, we may be assured that this item will necessarily be a very small one. Any person duly considering the fact that the Ohio River is constantly subject to floods of double, triple, and even quadruple the height of the proposed dams, will see in that circumstance natural and conclusive evidence that there can be no great extent or value of ordinarily available land within 15 feet vertical of low water. Therefore nothing is hazarded in assuming that the damages that could be caused by the permanent overflow of such pools on the Ohio River would be comparatively trifling.

ICE.

Another objection has been made, that the pools will cause the river to be more frequently and longer obstructed by ice, and will render ice freshets more frequent and more dangerous.

In comparatively low-water stages the Ohio River is already nothing more than a system of natural dams and pools. It is at such low-water periods that the heavy ice is formed. When these pools shall be made from 6 to 13 feet deeper, they will, of course, be *less* liable to freeze, and the ice upon them will therefore be thinner on account of this increased depth of the water. Consequently, in low water and freezing weather the steamers in the natural river are now forced to cease running sooner than they would be in the deeper pools. With the completed slack-water there would be practically *no period of low water*, and the steamers would never cease to run till very severe freezing should set in. The effect, then, of the slack-water system would be to prolong the time of navigation before closing from freezing; and in some seasons navigation might be maintained, as it has been occasionally on the Monongahela, *nearly all winter*. This, however, depends entirely upon the character of the winter. In ten years' experience on the Monongahela slack-water, from 1845 to 1854, the greatest number of days that navigation was stopped by ice was thirty-three, and in 1868–'69 the navigation continued all winter without cessation; the average number of days per annum for the whole period of stoppages by ice being fifteen and a half days. And the Ohio River was obstructed by ice very nearly the same length of time at the same periods. Combining, for comparison, the obstructions of ice and low water during the freezing months, there can be scarcely any doubt that with a slack-water in the Ohio the detention caused by the freezing on the pools would be less than now annually experienced on the natural river from ice and low water, as a general thing.

In regard to the second branch of this objection, on a careful consideration of the facts, it would seem that ice freshets ought to be *less* frequent with the deeper pools than in the case of the natural river, or at least not more frequent; and they will certainly be less dangerous, for two reasons: On account of the ice being thinner, and therefore weaker, and because, as soon as it commences moving it will be immediately broken to pieces at the dams and go forward in less formidable masses. Mr. Lothrop, for many years chief engineer of the Monongahela slack-water, reports exactly such experience on that improvement. With an experience of thirty years, the damage caused by ice on that river has not, on the whole, been serious.

During the winter of 1866–'67 I took occasion to witness the breaking up of the heaviest ice that had been known on the Monongahela during twenty-eight years; and no very serious injury was discovered, caused by the dams or to the dams.

This was one of the most remarkable winters for many years; and the Ohio River navigation was stopped, in consequence of ice, from the 19th of December to the 24th of December, and from December 29 to January 12, making seventeen days. The navigation on the Monongahela was stopped fourteen days.

All of the Ohio River, with the exception of that portion between Pittsburgh and Steubenville (67 miles), is farther south than Pittsburgh; and below that point, on account of its latitude, it is not so liable to freeze as the Monongahela River. Theory and experience, therefore, appear to unite in favor of the general assumption that the obstruction and danger to the navigation and shore interests, from ice, will be lessened rather than increased by the completion of a slack-water navigation on the Ohio; or that, at most, it does not present any material practical objection to slack-water on this river.

Another objection is, that it will injure the *coal business* and *lumber trade* of the river.

COAL TRADE.

Since the above objection was formally advanced, about thirteen years ago, the coal business has been almost completely revolutionized, and instead of being carried on in frail boxes floating with the current and destined never to return, it is now chiefly carried on in regular barges, in fleets managed by powerful steamers, built for this special purpose, called tow-boats. These fleets of barges, drawing from 6 to 8 feet of water, are not usually started until there is a depth of about 8 to 10 feet in the channel; and consequently they are obliged to remain at Pittsburgh and other points, sometimes for many weeks together, waiting for what is termed a "coal-boat freshet" before they can leave Pittsburgh and the other coal-producing points on the Monongahela and upper Ohio.

The system of barges now in use seems well adopted to the present circumstances of the river. The large and apparently unwieldly fleets, consisting of eight, ten, twelve, and sometimes fourteen barges, on the upper Ohio, presenting a frontage of 125 to 175 feet, and a total length, including the steamer, of 400 to 500 feet, moving only when the river is in flood, can yet be controlled by the powerful steamers, and many, though not all of them, pass safely throughout the entire length of the Ohio, over its nearly 1,000 miles of navigation, notwithstanding its numerous obstructions and dangers; and some of these fleets continue their voyages over a thousand miles farther down the Mississippi, to New Orleans. Of course these immense flotillas would be wholly unmanageable without the powerful tow-boat steamers, and sometimes, at certain points, they become partially unmanageable even with their aid. This system, it will be observed, is necessarily spasmodic and very irregular, being wholly dependent on natural freshets. If the freshets were regular, and always reliable, and the navigation were entirely freed from its present numerous obstructions and dangers, a safe as well as an extensive and profitable coal business might soon be perfectly adapted to it, and little more would be needed in connection with this peculiar system; but the freshets, it is well known, are very irregular, and by no means always to be relied upon in advance. The year 1865 was, in this respect, remarkably favorable, and 1866 was still more favorable, on account of the number of fine, available coal-boat freshets; and this had the effect of stimulating the coal business of the year to an unusual extent.

The construction of a regular, always reliable steam-boat navigation, on any permanent plan, would undoubtedly work an entire change in the programme of the Ohio River coal business. The same steamers and the same barges could be employed, or possibly lighter and less powerful steamers might then be used with advantage steadily all the year round, making regular trips uninterruptedly, each steamer taking fewer boats than now, but running at all times, and therefore making many more trips during the year, with perfect regularity and dispatch; and consequently doing the same, or a larger amount of business, with less capital, at less cost, and at less risk. A steamer of moderate size could pass through the large lock with five large barges at one lockage. Such a "tow" would occupy, say, fifteen minutes in passing each lock, with its 50,000 or 60,000 bushels of coal (1,785 or 2,143 tons). If but ten such tows passed daily, occupying two and a half hours at the lock, taking the lowest number of bushels (50,000) to each fleet, and allowing only 300 days of navigation, it would give 500,000 bushels daily, (17,850 tons), and 150,000,000 bushels for the year, (5,357,000 tons). The passage of even three such fleets per twenty-four hours would amount to 45,000,000 bushels per annum, or about 5,000,000 bushels more than the whole Ohio coal trade from Pittsburgh during 1866—the largest up to that date of any year. This is presented in the particular shape merely to exhibit in a striking light the change that might probably take place in the manner of conducting this coal business. The fleets would require, on a single trip, more time than now for the descending trip but less time than now for the return trip; and generally returning nearly empty, or comparatively light, the up trip, except in floods, would take a shorter time than the down trip. Parties desiring to send still larger tows, as they do now, with the heavier steamers, to be run only in cases of freshets, would do so if they chose, by running only at such times as the floods were sufficient to make a safe navigation through the chutes of the dams, which would occur, as now, several times during the year, though at irregular periods, of course, as heretofore. The probability is, however, that with the navigation thus improved, so as to present at all seasons a reliable navigation, 6 feet deep, much of the freshet coal-boating would, from pecuniary consideration, nearly or quite cease. That is to say, not much, if any, coal would be held over for freshets, or little in comparison with the entire annual trade. There is now, every year, a heavy expense attending the coal business, which would then be entirely saved, namely, the watching and bailing of arks and barges; waiting days, weeks, and sometimes months, for a coal-boat rise; meanwhile, also, the powerful and costly towing steam fleet being at the same time idle and under unavoidable expense—altogether making a constant investment of much dead capital, in addition to other continued expenses and risks which never cease, no matter how long the intervals between the coal-boat floods.

Between Pittsburgh and Louisville, a distance of 598 miles, with the assumed number of locks 51, the probable time required to tow a loaded five-barge fleet down and an empty fleet back would be as follows:

Descending.

	Hours.
Time at 51 locks, 15 minutes each	12¾
Running time with loaded barges, 598 miles, at 5 miles an hour	119½
Equal 5 days and 12¼ hours	132¼

Ascending.

Time at 51 locks, 15 minutes each	12¾
Running time with empty barges, 598 miles, at 6 miles on hour	99¾
Equal to 4 days 16½ hours	112½

"Total time of round trip, 10 days 4¾ hours, or, say, 11 days per trip. Then 11 divided into 300 days, the assumed annual period of certain navigation, would give 27 trips foı the year; which, at 50,000 bushels per trip, would make 135,000 bushels (or 48,214 tons) per year for each tow-boat; so that, to accommodate the business done during the past year, 1869, namely, 45,000,000 bushels, would require, say, 33 light towing-steamers, each of only power sufficient to conduct 5 barges. This number of steamers is certainly less than half of the number required to do the business of 1866 on the natural river, even with much more powerful and consequently more expensive steamers, though it of course included the coal taken below Louisville for the Lower Ohio and Mississippi.

"A little error of judgment one way or the other in these approximate calculations of the time and of the capacity of steamers, etc., will not seriously affect the general comparison or the general showing here designed to be made. My object is to present merely a fair, reliable comparison, and to show the reasonable probability that upon a navigation thus improved the coal business may be conducted with a very great saving to all concerned.

"In this connection it is proper to refer to the fact that on the present system the annual losses to coal shippers are in the aggregate very great, a large portion of which, it is believed, would be saved upon the improved navigation and changed system.

"It is considered by men of experience in the present coal-shipping system, that there has been an annual actual loss of from 8 to 10 per cent. of all the coal that starts from Pittsburgh. Some place it higher. Thus, on 1,600,000 tons, valued at $4 per ton, the total value would be $6,400,000, 10 per cent. of which would be $640,000 for the annual loss in that way. Besides, at present the actual cost of transporting coal, say from Pittsburgh to Louisville, is about 7 cents per bushel, or, roundly, say $2 per ton. Now, if a saving of 25 per cent., or 50 cents a ton, can be effected in this item on 2,000,000 tons (56,000,000 bushels), the annual saving in the near future would amount to $1,000,000, making annually $1,640,000, if all could be saved. And since the quantity from Pittsburgh alone in 1866 was over 1,428,000 tons, and in 1869 over 1,600,000 tons, we may with propriety estimate 2,000,000 tons as the probable quantity within a very few years.

"In an enlarged view of this question of saving it is proper to refer to what the Ohio coal trade will probably attain within the next ten, or even twenty years, in the event of an improved, reliable navigation. It may soon be 5,000,000 tons annually, or even much more. And with no more than 5,000,000 the probable estimated yearly saving in cost of transportation alone would be $2,500,000; and this on a single article of the commerce of the Ohio River. I am, therefore, led to conclude that the establishment of the slack-water navigation, or any radical improvement of the Ohio River, would ultimately conduce greatly to the advantage of the coal business, make it more regular, more reliable, and much more free from risks, more profitable to miners and shippers, and cheaper to consumers; and thus materially aid in its further development. It is true, however, that a similar or much better improvement would arise from a constantly reliable 6-foot navigation, free from drawbacks of locks and chutes, if such can be secured. Nevertheless, slack-water navigation, in the absence or impracticability of such better navigation, seems to offer a very decided improvement over the natural river with its present precarious, irregular, and obstructed navigation, especially in connection with the coal business. There may be other points in connection with slack-water bearing upon the question of the coal trade, but those above referred to, it is believed, embrace the chief items of interest.

"INJURY TO THE LUMBER TRADE.

"In regard to the lumber trade floating on the river, in the shape of rafts, etc., it is assumed that chutes at the dams can be so arranged as to permit them to pass with safety on such freshets as the lumbermen usually descend with their rafts. It is believed also, in the event of a complete slack-water navigation below the head of the Ohio, that large quantities of the lumber would be prepared or manufactured at and above that point, and distributed to the lower river in barges; and with the rapidly advancing prices of lumber it may be found in the future advisable to carry it nearly all in barges to prevent the deterioration in value caused by its floating so long and collecting the sediment and, of late years, oil in its pores. It is not urged, however, that the descending navigation for rafts will be improved by the dams, but that such provision can be made by means of proper chutes as will do away with any necessity of using the locks for rough lumber, except as already referred to when put into the shape of prepared or manufactured lumber in barges, although locks might be used of choice occasionally by rafts.

"ASSUMED FILLING OF POOLS WITH SEDIMENT.

"It has been objected that the pools would fill with sediment. It is well known, as already remarked, that the Ohio River in its natural condition is but a series of pools and natural dams; some of the pools being 30 feet deep and many of them 15 feet or more. There are on the Ohio River 187 pools having more than 7 feet depth in extreme low water, covering an aggregate length of 632 miles. The present pools do not fill with sediment. On the contrary, the frequent floods rising to 30 and 50 feet, or higher, maintain them as a rule in their normal condition. Experience on the Monongahela, which is much more muddy in freshets than the Allegheny River, the larger confluent of the Ohio, does not show any such result. Changes may take place in some of the movable bars, but general experience with numerous rivers on which dams have been in use many years proves that in all cases when they are subject to considerable floods, as in the Ohio, they sweep out the pools, leaving the navigation unobstructed by sediment. My opinion is that this objection has no real foundation; that there are no reliable facts to sustain it.

"LIMIT TO FREIGHT BUSINESS.

"It has been mentioned as an objection to locks and dams that they would set a *limit* to the amount of freight which can be transported on the river.

"It is true that any lock navigation, however capacious, is not illimitable. In this sense a slack-water system, if unaccompanied with chutes, will of course set a limit; but it must be kept in mind that the present precarious, obstructed, and irregular natural river navigation also sets a limit to the freight that can or will be carried; a limit which is quite *absolute* occasionally *for several months consecutively*. It is true also that when the river is in flood, or in a perfect navigable state, as it is for some months every year, its capacity at such periods may be considered for the time unlimited.

"Yet the irregularity of these floods, in the nature of the case, actually limits the total trade. It must be granted that if there are any practicable means of obtaining a constant flow of 6 feet, or even at the lowest times 5 in the natural river, so as to do away entirely with low-water stages, such a navigation will be very far superior to the most perfect slack-water navigation. In that event the capability of the river as an avenue of commerce would indeed be practically without limit.

"It is not with such a river of the fancy or of the possible future that we have now to deal or to compare with the slack-water. On the contrary, we have a river so subject to fluctuation, and to obstructions interfering with the movement of loaded vessels on account of low-water periods, that it now practically limits the actual freighting that can annually be advantageously or profitably done upon it. The intervals when the navigation is good for a profitable class of freight-boats are now so irregular as greatly to cripple and retard the growth of river trade, and thus also to limit it as well as to tax it heavily in consequence of this irregularity. Admitting that the present precarious navigation might, under this heavy tax arising from stoppages, delays, and irregularities, be naturally more capacious than an ordinary slack-water system, the real practical question at last is, what sort of a limit would the slack-water present? It must be recollected that for one-sixth of the time, or during about two months of the year, there would be a free, unobstructed navigation over the dams, both for ascending and descending vessels, at which times the limitless capacity of the stream would be the same with or without the dams; and that during other considerable periods there would be a safe descending navigation through the chutes, and that then, as now, a large amount of lumber, coal, and other freight might pass without using the locks at all. Let us examine the capacity of the *locks* for freight business, independently of the foregoing additional facilities.

"It will be within bounds to allow fifteen minutes for the passage of a steamer; and it is not unreasonable to assume that the cargo might amount to 500 tons (under a regular and always reliable navigation). This would give 2,000 tons per hour, or 48,000 tons per day, and for the 300 days allowed for navigation 14,400,000 tons per annum. This would be the capacity even of a single-lock system; and with double locks double this business, or equal to 28,800,000 tons per annum. No one would perhaps be justified in asserting that such an immense trade as this is *never* hereafter to be secured on the Ohio River, but this amount is so enormous that it may be considered that the slack-water, keeping in view as we ought the amount of freight that would be passed outside of the locks, sets no limit practically to the freight business on the river, for, if ever the trade should attain to that magnitude and the business should become so crowded as really to demand it, additional locks could be built, at which time, under the circumstances, their cost would obviously be quite insignificant compared with such vast transactions. So that, although there *is* a limit, it is practically so far off and has reference to so large a trade as not to constitute in itself a serious practical objection to the system of locks and dams, although it remains as an abstract objection not applicable to a river with a constant natural channel never less than 5 feet deep, and generally 6 feet or more, as hoped for but not existing. Objections: that the pools along the river will render the country unhealthy.

"It is somewhat singular that this objection originated with a civil engineer, one who at the very same time was advocating the construction of a vast number of reservoirs and river pools all over the country, which it was proposed to draw down in summer as feeders for the Ohio River; and while contending that such reservoirs, thus used and emptied in the hot season, would not be unhealthy, asserted or claimed that the suggested pools on the Ohio River would be pestilential and create sickness, although they were never to be drawn out, as in the case of the other proposed reservoirs.

"My experience on the Lehigh, the Schuylkill, the Susquehanna, the Juniata, the Kiskiminetas, and the Beaver Rivers proves that in every case the river valleys were more healthy after the erection of the dams and slack-water than they were before. Along the Monongahela also the health of the valley has been improved and its population very largely increased in consequence of the advantages of the slack-water.

"The quantity of water that would be contained in slack-water pools on the Ohio River would be very great, much greater than now, and the healthfulness of the Ohio valley would, in my opinion, be improved rather than injured by the construction of the dams. I can not, therefore, without doing violence to years of experience and to my own judgment, regard the proposed river pools as in the least objectionable on the score of their fancied insalubrity. This objection can not, I think, be sustained, either theoretically or practically.

"DELAYS AT THE LOCKS.

"Another objection is made on account of delays to steamers, etc., at the locks. It is a legitimate objection which appertains to locks that all vessels using them must of necessity stop and be delayed some minutes at each lock. But in the case of a slack-water on the Ohio there are compensations which reduce the actual total delay in the trip of a steamer very considerably; and, compared with some stages of the natural river, as for instance in very low water, the round trip could be made quicker in the slack-water, notwithstanding the delay at the locks. On the Monongahela slack-water, between Pittsburgh and Brownsville, the distance is 55 miles, with 4 dams and locks. Capt. E. Bennett, who has long run steamers upon that improvement, stated some years ago as follows: 'The time of running the 55 miles, including the passing of the four locks, varies from 6 hours to 5¼ hours (9 to 10⅓ miles an hour, including the delays) by different boats. Generally it takes as long to go down as to go up. We count the time it takes, *including all stoppages for freight and passengers*, eight hours up and eight hours down. The average time to pass each lock is from seven to ten minutes, but it can be done much quicker if required. A boat has been passed through No. 4, in a good stage of water, in two minutes twenty seconds. We can land, put out a passenger, and get under way again in from two to three minutes. Before the completion of the slack-water I do not recollect coming up from Pittsburgh to Brownsville in less than *twelve hours*, and frequently from *twenty to twenty-four*. * * * We frequently make the trip when the river is frozen to the thickness of three inches. * * * I think the ice does not form so quick in pools in the first freeze as it did before the dams were built, owing to the greater body of water to be brought to the freezing point. * * * I can not say that the boats have been stopped by low water more than in the summers of 1854 and 1856. In 1854 our boats were laid by eighty-two days, and a good part of that time there was no navigation for any steam-boat of lighter draught (our boats draw 3 feet light.) Our locks and dams have not caused much detention by being out of repair. We are occasionally detained for a short time by something getting behind or before the gates, so as to prevent their opening or closing.'

"There can be no question that the time of navigating has been lessened on the Monongahela by the use of the slack-water.

"The average length of pools on the 598 miles between Pittsburgh and Louisville, with fifty-one dams of 6 feet lift, would be about 11¾ miles. The pools would be shorter on the upper end nearest Pittsburgh, and longer on the lower part. In a round trip between Pittsburgh and Louisville and back there would be 102 lockages, and, allowing fifteen minutes lost at each, it would give twenty-five and one-half hours thus lost at the locks. Allowing one stoppage to land passengers, etc., in each of the fifty-one pools, both going and returning, or 102 stoppages in all, and three minutes lost time at each would give 5 hours 6 minutes lost in landings. Allowing for general steamers a running average rate of 12 miles an hour going down and an average of 11 miles an hour going up would give 51¼ hours down, and 56 hours up; making a total of 138 hours, or 5 days 18 hours, including landings and lockages, on the slack-water, allowing no time at Louisville.

"On the natural river, with about 5 to 6 feet water in the channels, which is regarded as a fair stage for running, steamers on an average may run down stream about 14 miles an hour, and up stream about 8 miles an hour. This would give an average both ways of 11 miles an hour, or for the 1,196 miles round trip, say, 109 hours. Add for 51 landings down, at 5 minutes each, 4½ hours, and 51 landings up, at 3 minutes each, 2½ hours, total 116¾ hours, equal to 4 days 20¾ hours. Difference, 21¾ hours in favor of the open river in such a good stage.

"The best stage of water for the packets in the natural river is about 15 feet at Pittsburgh and 20 feet at Cincinnati. The time from Pittsburgh to Cincinnati, down, about 28 to 30 hours, has been done in 27 hours down and 45 hours up on this distance of 466½ miles. This gives an average of about 17 miles an hour down and 10 miles an hour up; but when running thus against time the down landings would not be more than two or three, and running up they would stop their engines only long enough to take a wood or coal flat in tow about three times, *not landing at all.*

"The average landings down, in a business trip on the natural river, would now be about 25 and up about 35 between Pittsburgh and Cincinnati. The higher the water, the more time lost in rounding to on the descending trip. The average time out from port to port, round trip, is about 5½ days; about 33 hours lost at Cincinnati and 11 hours landing. This would leave 88 hours for running time, on 933 miles round trip, or an average of 10 miles an hour. In ordinary low water, the time consumed in the running round trip would be from 6 to 12 hours longer than in high water. Taking the average at 9 hours longer, it would bring the average running speed, down and up, to 9 and 7 miles an hour, not allowing for any lost time by grounding. These facts were furnished by Capt. C. W. Batchelor, an experienced Ohio River steam-boat-man. My own opinion is that in moderate stages of water, on a slack-water navigation, the average rate of speed for the same vessels would be about 12 miles an hour down and 11 up, or an average of 11½ miles an hour both ways; on 933 miles this would give 84 hours, or 3 days 12 hours running time for the round trip, exclusive of the delays at the locks, which at 15 minutes per lockage would be 23 hours.

"In very low water the regular packets can not now run. In ordinary seasons they are laid up 3½ months on an average. Very light draught boats formerly ran all summer, when there were 20 inches of water in the channel. Navigation on the Ohio River may be roundly divided thus: 3½ months below 4 feet; 2½ months above 12 feet; and 6 months, *at irregular intervals*, between 4 and 12 feet. There will be 3½ months of the year when the slack water would have greatly the advantage in time, keeping in view *low-water delays;* 6 months when the advantage would be in favor of the natural river; and 2½ months when they would be about equal; that is, when steamers could run over the dams. But in all these approximate comparisons it is also to be considered that now, with the river in its present natural unimproved state, there are frequently from two to four months of the year when the larger boats, and even medium-sized steamers, *can not run at all;* and also at times extreme low-water periods when practically there is no good navigation even for very small boats, though this last case does not occur every year.

"Under such contingent conditions it is obvious that the case does not admit of mathematical demonstration; it belongs eminently to the domain of merely practical approximations. While, therefore, the use of locks and pools would involve loss of time when compared with the natural river only in its good stages, it would in the aggregate in some years be a saving of time, taking the year round. The delays at the locks ought not to be considered without also taking into account the saving of much more considerable delays now caused during the year by the precarious, uncertain stages of the natural river, induced mainly by low water, though this is not available in a comparison with a perfected river navigation. In case the slack-water plan should in other respects be deemed feasible, advantageous, and advisable for the Ohio River, the question of delays, vexations, and extra cost of steam-boating, shipping coal, etc., caused thereby should

receive the most careful consideration. It is a question whether the delays, etc., now unavoidably encountered to a great extent every year, are not in the long run much more annoying and costly to the river men than would be the delay caused by lockage, when taken in connection, as it should be, with regularity, safety, and the perennial nature of the lock-and-dam navigation. It is not, however, my purpose or wish to earnestly press this point; but I desire fairly to present it to the consideration of the Department and to all persons interested in the radical improvement of the river.

"In the sequel, after having completed the investivation of other plans, I will be prepared to present them all in comparison with each other.

"I will now refer to the reservoir plan.

"RESERVOIR PLAN.

"The originator of this proposition for the permanent improvement of the Ohio was Charles Ellet, jr., esq., civil engineer, since deceased. It was afterward strenuously advocated by Elwood Morris, esq., civil engineer. The plan itself, of storing up the rain-fall to feed navigable rivers in times of drought, is not new, the same having been discussed in a work written by Mr. Thomas Telford, the distinguished English civil engineer, about the year 1800. Mr. Telford urged the plan for the improvement of the navigation of the river Severn. His plan was 'to collect the flood-waters into reservoirs, the principal ones to be formed in the hills of Montgomeryshire, and the inferior ones in such convenient places as might be found in the dingles and along the river. By this means the impetuosity of the floods might be greatly lessened, and a sufficient quantity of water preserved to regulate the navigation in dry seasons, etc. This, it is thought, might even prove the simplest and least expensive mode of regulating navigable rivers, especially such as are immediately on the borders of hilly countries.'

"Mr. William Jessup, another English engineer of those times, said on one occasion, 'Rivers may be rendered nearly uniform throughout the year by reservoirs;' while Mr. Rennie, another distinguished English engineer, remarked, 'After what has been said respecting the excess of flood-water in the river Roch above the ordinary supply, the *idea of correcting the floods of the Severn by reservoirs must appear to be ridiculous.*' The Severn is very far inferior in size, length, extent of drainage, height of floods, etc., to the Ohio, the whole length of the Severn up to Welsh Pool being but 155 miles, while the Ohio up to Pittsburgh is 967 miles. The highest floods in the Severn were about 16 feet, the average height of floods about 7 feet; while the highest floods in the Ohio are from 40 to 60 feet, and the average height of floods is over 20 feet.

"My own careful investigations of the subject of controlling the floods of the Ohio by means of artificial reservoirs, which were made in 1857, satisfied my mind conclusively that such control by any human means attainable within the practicable limits of cost is impossible. I will not, therefore, in this report devote any space to the consideration of the reservoir plan *as a means of controlling the floods of the Ohio River.* My present attention will be turned wholly to its consideration as a means of effecting a perennial flow in the natural channel of the river sufficient to make a navigation 6 feet deep at all ordinary periods of low water, and not less than 5 feet deep at a period of extreme drought.

"The area of country drained above Pittsburgh, and which sheds its rain-fall into the two confluents, the Alleghany and Monongahela Rivers, which form the Ohio, is about 240 miles long from north to south, and about 80 miles wide from east to west, comprising about 19,200 miles. The area drained above Wheeling has been considered to be 24,337 square miles. It is sufficiently accurate for all practical purposes to consider 19,000 square miles as the area of gathering-ground for the waters concentrated at Pittsburgh.

"Observations of the flow of water passing Wheeling have shown that there was one year, 1845, when it represented only 9.83 inches depth from the area above quoted, viz, 24,337 square miles. This was the assumed available total quantity at that point for the year, according to Mr. Ellet's investigations and calculations. We may, however, safely estimate the minimum available average annual rain-fall passing Pittsburgh at 12 inches on the area of 19,000 square miles, giving a total for the year of 529,689,600,000 cubic feet. So that if the whole available rain-fall was stored in reservoirs it would afford a daily flow of 1,423,807,123 cubic feet. According to the calculations, this would have made a constant average depth of nearly 7 feet at Wheeling.

"The quantity required to keep up 6 feet depth at the same place was calculated from the flow at Wheeling to be 1,164,000,000 cubic feet per day. Supposing only the same quantity to be sufficient to maintain 6 feet depth between Pittsburgh and Wheeling, and especially between Pittsburgh and Beaver, where the fall is about 15 inches per mile, it would prove that usually enough rain falls annually, if it could be equalized, to afford 6 feet depth constantly at Wheeling, and perhaps nearly 6 feet at at all points below Pittsburgh and above Wheeling.

"If provision could be made for keeping up a steady natural flow of 6 feet between Pittsburgh and Beaver, where the most rapid descent occurs, it would be ample at all points below; bearing in mind the additional supply from the lower tributaries. To bring the water from the low stage of 1 foot to a 6-feet stage it was calculated would require a daily supply, at Wheeling, of 1,062,000,000 cubic feet. (The calculated daily flow of the low-water depth of 1 foot at the same place was 102,000,000 cubic feet, about one-tenth enough.) Assuming now that 100,000,000 cubic feet per day represents nearly enough the low-water flow of 1-foot depth at Pittsburgh, and that about 1,200,000,000 cubic feet per day represents the entire quantity required to keep up a 6-feet flow between Pittsburgh and Wheeling, it would require 1,100,000,000 cubic feet daily to be provided artificially during such low-water periods; and of course less in proportion on different stages of the river, up to a 6-feet natural flow.

"It is important to determine how many days of low water ought to be provided against, although in most years a smaller number might occur. We must anticipate that what has happened in times past may happen again.

"In 1838 the river was—

	Days.
At or below a 1-foot stage (some days as low as 10 inches)	32
Between 1 and 1½ feet stage	13
Between 1½ and 2 feet stage	17
Between 2 and 2¾ feet stage	37
Between 2¾ and 3 feet stage	5
Between 3 and 4 feet stage	29
Between 4 and 5 feet stage	28
Between 5 and 6 feet stage	3
Total below 6 feet	164

"No two successive seasons are alike. And it may be said that even in a long series of years no two of the seasons are alike in the flow of water in the river. In 1854 the extreme low water was lower on the Upper Ohio even than in 1838; so that on the upper part of the Ohio River the navigation nearly dried up, while on the lower portion of the river there was still some navigation. Local causes operate powerfully on the Ohio River, so that its whole length is not often at precisely the same stage for navigation. Of course a very heavy flood at the head of the Ohio will cause a flood of some extent to pass over its entire distance of 967 miles to Cairo; but often floods enter into the Ohio from its large tributaries below, without any equivalent rise on the main stream above them. And sometimes when the headwaters of the Upper Ohio are suffering from drought the lower portion may still be well supplied from the lower tributaries. Even as high up as Pittsburgh, at the head of the Ohio proper, sometimes the Monongahela is in flood when the Allegheny, the other confluent, is not, and *vice versa*.

"All this arises naturally from the immense area and different topographical character, climate, etc., of the territory drained by the Ohio and its numerous branches. When it is considered that this area is 214,000 square miles, or 45,000 square miles more than the territory drained by the Mississippi proper above the mouth of the Missouri (that being only 169,000 square miles), such effects can be easily understood. The northern heads of the Ohio, in New York State, are in latitude 41° 20′, while the mouth is in latitude 37° north, not far above the lower boundaries of Missouri and Kentucky. Its eastern tributary heads are in longitude 78°, and its mouth in longitude 89° 20′ west; thus comprising 5° 2′ of latitude, and 11° 20′ of longitude, western tributary heads. Its whole length, from its sources in Potter County, Pennsylvania, to Cairo, Illinois, is about 1,300 miles. No river in the United States, if we except the Missouri and Lower Mississippi, drains a region of equal extent. And according to the able and elaborate report made in 1861 by Capt. (now Maj. Gen.) A. A. Humphreys and Lieut. (now Brig. Gen.) H. L. Abbott, the downfall of rain over the Ohio drainage is greater in actual water supply than that of the Missouri; the Missouri area being therein stated at 518,000 square miles, with an average annual downfall of 20.9 inches, giving an annual river discharge of 3,780,000,000,000 cubic feet. Ratio between downfall and drainage, 0.15. Mean discharge, 0.15. Mean discharge per second, 120,000 cubic feet. While the Ohio, with an area of basin of 214,000 square miles, is stated to have an average annual downfall of 41.5 inches; annual discharge, 5,000,000,000,000 cubic feet. Ratio between downfall and drainage, 0.24. Mean discharge per second, 158,000 cubic feet. The discharge from the Ohio being 31.66 per cent. greater than from the Missouri. The area of the basin of the Upper Mississippi, 169,000 square miles. Downfall of rain, 35.2 inches. Annual discharge, 3,300,000,000,000 cubic feet. Ratio between downfall and drainage, 0.24. Mean discharge per second, 105,000 cubic feet.

"The discharge from the Ohio, as stated, is, therefore, 50.47 per cent. more than from the Mississippi above the mouth of the Missouri. In the same report, page 93, the

features of the main Mississippi (or combined Missouri and Mississippi) are stated as follows: Drainage area, 8,244,000 square miles; downfall of rain, 30.4 inches; annual discharge, including three outlet bayous, 21,300,000,000,000 cubic feet; ratio between downfall and drainage, 0.25; mean discharge per second, 675,000 cubic feet.

"The discharge from the Ohio River alone is, therefore, 23.40 per cent. of the total discharge from the entire Mississippi, Missouri, Ohio, and all their tributaries to the Gulf combined. Nearly one-fourth of all the water discharged by the mouths of the Mississippi into the Gulf of Mexico is therefore furnished from the Ohio drainage. The annual depth of rainfall in that part of the basin of the Upper Ohio above Pittsburgh is probably less than the depth of the entire Ohio rainfall given in the report quoted for the entire basin. It has been usually assumed above Pittsburgh approximately at an average of 36 inches for the upper portion of the Ohio basin; and the observed flow of the water in the river at Wheeling, embracing the flow from about 5,000 additional square miles, having one year shown but 9.83 inches depth of rainfall passing, it has been considered that about one-third of the average annual downfall flows off by the river, and that 12 inches of the 36 inches of rainfall might safely be assumed as the available supply for navigation from that region.

"In the report of General Humphreys the downfall of rain throughout the entire Ohio region area of 214,000 square miles is said to be 41.5 inches, of which 24 per cent. are discharged by the Ohio. This gives 10 inches out of the 41.5 inches as available.

"Nothing short of an extensive system of rain gauges at numerous points, with careful records through a number of years, could give more accurate or more reliable data than we now have bearing upon this question respecting the quantity of water annually passing at the head of the Ohio. Nor is strict accuracy at all necessary for the present partly theoretical investigation of the subject of the reservoir plan, since it is clear from the premises, and the data already cited, that enough water flows during the year, if equalized, to secure the desired navigation of about six feet depth all the year round.

"Mr. Ellet, the distinguished engineer who projected this plan for the Ohio River, and and Mr. Elwood Morris, who advocated it afterwards, appear to have convinced themselves of the feasibility of thus equalizing it at a very moderate cost.

"It may be proper to mention here that I made an informal examination or criticism of their views in an article which was published in the Journal of the Franklin Institute in 1857, my chief object at that time being to call the attention of our public men at Washington to the importance of *investigating* carefully before adopting finally *any* plan then proposed for the radical improvement of the Ohio River, inasmuch as Congress was then very strongly importuned to make an immediate appropriation for the construction of several reservoirs, as a commencement of Mr. Ellet's plan for adding to the natural flow of the stream.

"I believed then, as I think was proved, that while this reservoir plan may be demonstrated to be *theoretically* practicable as a means for equalizing to a certain extent the flow in the river, such partial equalization would cost very much more than its projector anticipated; and there are practicable, unavoidable, and insurmountable difficulties which probably must forever prevent the actual accomplishment of such equalization.

"These difficulties are occasioned by the immense body of water which it was proposed thus to control, and by the fact that, even supposing reservoirs in sufficient numbers and capacity to be constructed to hold the entire flow which passed Wheeling from the drainage above it during the year 1845, namely, 555,482,000,000 cubic feet, the projector of the plan showed that in 1847 the quantity was 1,142,258,000,000. The difference is 586,776,000,000, or more than the entire flow of 1845. And even in that year of abundant flow (1847), when this immense body of water passed Wheeling, that quantity, enormous as it is, constituted less than one-fifth of the discharge of the Ohio River. The average discharge assigned to the Ohio, in the table referred to, being 5,000,000,000,000 cubic feet, consequently the discharge of an abundant season is considerably more.

"It was proved, from an examination of the records of the floods on the upper part of the Ohio, that some of the highest floods occurred when such reservoirs, had they been in existence, must have been full. Such being the case, they could not have aided in restraining those floods. And this would certainly be the case almost every year, if not (to a considerable extent) every year, owing to the utter irregularity of the periods when great floods occur. Let us glance for a moment at this one fact, namely, that if by possibility there could be a gigantic dam, 400 feet high, at Wheeling, sufficient actually to stop and absolutely to control all the water of the 27,337 square miles of drainage above Wheeling, it could not restrain any portion of the flow from the remaining 189,663 square miles of the Ohio Valley, nearly seven times the area. We should even then have control of only about one-ninth of the area of the Ohio River territory. As a practical engineer I can not hesitate, therefore, in expressing the opinion that the scheme of controlling or of equalizing the floods of the Ohio River by means of artificial reser-

voirs is certainly impracticable; and that in any merely human view of the question it is practically an engineering impossibility, which it would be a waste of time further to investigate, excepting, as now, collaterally.

"The question of constructing reservoirs of sufficient capacity to supply the Ohio River in low water, so as to raise the river from a 1-foot to a 6-foot stage or to a 5-foot stage, is entitled to serious consideration. The quantity of water required to be stored for this purpose is very much less than the whole flow of the Upper Ohio in some seasons, although it is still so large as to be very difficult and expensive to command by artificial means; much more difficult and much more expensive than the projector and advocates of the reservoir plan fancied or estimated. To bring the river from a low-water stage of 1 foot to a 6-foot stage, as we have assumed, would require, as already mentioned, a daily supply of 1,100,000,000 cubic feet. If we assume, also, that continuous low-water periods may occur equivalent to one hundred days, it would require 110,000,000,000 cubic feet from artificial reservoirs. Accuracy in regard to this particular point can not be arrived at; it does not appertain to the nature of the problem; nor is it very important; but it may be said that, with this additional quantity of water at perfect command, the navigation during most seasons might be kept most of the time at or near 6 feet depth. The quantity to be stored in this case would be, as above, 110,000,000,000 cubic feet. From the records and calculations of Mr. Ellet, as applied to one year, 1841, when for one hundred and nine days the water at Wheeling was below 3 feet, it appears that the flow due to a 6-foot stage in the natural river would be—

	Cubic feet.
For 109 days	126,876,000,000
And deducting the natural flow during the same 109 days	17,147,000,000
Artificial supply needed for 109 days	109,729,000,000

"There were 109 days in 1841 when the river was at or below 5 feet, and 207 days when it was below 6 feet. Approximate calculations made the total probable artificial supply in that case needed at Wheeling to be 143,729,000,000 cubic feet. The advocates for the reservoir plan assumed the quantity to be stored in reservoirs at 150,000,000,000 cubic feet in round numbers, which may be regarded as sufficiently near for all present purposes of comparison, even when made applicable at the head of the Ohio for that portion of the river which has the greatest fall—15 inches per mile—between Pittsburgh and Beaver. If, upon future critical investigations, in case they should be made, this quantity might hereafter be placed at somewhat more, the difference is not likely to be sufficient to affect any general conclusion respecting the merits of the several plans proposed for the radical improvement of the navigation.

"Two modes were proposed for storing up this immense body of water. One by means of numerous smaller dams, making reservoirs on or near the headwaters of the tributaries; the other by fewer large dams. The projectors and advocates of these modes, in order to show to others, as they believed themselves, that it was easily practicable to obtain this quantity of water, and easy to control it, presented certain assumed data, and laid down certain axioms bearing upon the question. The chief of these may be quoted as follows: 'Can we find six reservoir sites upon as many creeks, each draining a basin equivalent to 40 miles long by 15 miles wide?' 'Can proper locations be found at the lower ends of these basins for the six dams necessary to form six lakes, commanding each a drainage of 600 square miles? Or for a greater number of lakes of equal aggregate capacity? For the present we will assume (what we do not doubt) that six suitable sites can be found, and that six dams can be erected, each ponding back or giving an annual available capacity of 25,000,000,000 of cubic feet of water.'

"My personal engineering knowledge of the region, acquired from many years' experience, has enabled me to investigate this point so as to refer to it in a practical manner, to some extent, without new surveys. In making an examination of the merits of the several plans for improving the Ohio, I endeavored to look carefully to the difficulties and objections natural to each. This examination led to the conclusion that the premises laid down for these projected lakes on the creeks *can not be found combined anywhere*—not in a single instance.

"The combination required was or is an area of country draining 600 square miles, a fall not over about 4 feet per mile for the stream, a place below this basin to be drained where a dam 100 feet high could be erected, and a shape of ground so that its pond would contain the drainage of a year from the surface of the 600 square miles.

"Mr. Ellet showed that an average of a number of years gave about 40 per cent. of the downfall of rain as available, but that in several years it was less than 33⅓ per cent. Mr. Morris earnestly advocated, for the headwaters of the Ohio, the assumption of 50

per cent. as reliable. I felt constrained to coincide with the judgment that it was not safe to rely upon more than 33⅓ per cent. Upon the quantity of water assumed above, this would demand nine lakes of the size designated.

"The proposition was that such 'sites might be found near or upon elevated grounds, with moderately steep water-sheds of ordinarily impervious material,' and so situated that a dam 100 feet high would pond back 25 miles, and hold 25,000,000,000 of cubic feet of water.

"In the first place, there is no *creek* tributary to the Allegheny or Monongahela River that drains 600 square miles, excepting French Creek, which has as little fall as 4 feet per mile, and French Creek, owing to causes that will be referred to, is entirely unavailable. On Red Bank Creek, or river, as it is often designated, a dam even at its mouth would not flow back more than a little over half of 25 miles, owing to the fall in the stream (7½ feet per mile), and a dam 100 feet high would not pond more than about one-sixth of the assumed quantity.

"The Clarion River, a principal tributary of the Allegheny, drains sufficient territory—say, 1,400 square miles—but even this stream does not possess any other of the necessary assumed characteristics for one of the proposed lakes, for it rises even on its lower part 6¼ feet per mile, and on its upper part, from Ridgway up both its forks, from 7 to 50 feet and more per mile, with no flat places either on itself or on any of its branches, while its valley is so narrow that a dam 100 feet high anywhere on the Clarion River would not pond one-fourth of the assumed quantity. Above Pittsburgh there are but five tributaries of the Allegheny that drain 600 square miles—namely, the Kiskiminetas, the Clarion, the Red Bank, French Creek, and Connewango Creek.

"The Kiskiminetas River (entering 28 miles above Pittsburgh) has a fall of nearly 4 feet per mile; a dam 100 feet high would pond back about 25 miles, but its general valley is confined. At an average of 50 feet above present low water it may be about 1,200 feet wide. A reservoir on this part of the stream might contain, including the flow back along its tributaries, about 8,000,000,000 cubic feet, or say one-third of the assumed quantity for one reservoir. This is the part of the river where the least damage would be done by the construction of a dam 100 feet high. But even here it would submerge 20 or more miles of the Northwestern Railroad, and destroy not less than 20 valuable salt wells, several considerable towns, Leechburgh, Warren, Saltsburgh, or at least two of them, and several valuable water-powers. Further details of damages, etc., are not deemed necessary in this place. The Conemaugh River, above Blairsville, falls about 10 feet per mile. The Connewango Creek drains about 960 square miles. The distance from Chautauqua Lake to Warren, following the Cassadaga and Connewango Creeks, is about 29 miles, and the fall 119 feet, or something over 4 feet to the mile. Chautauqua Lake drains but a small area of country. A dam to be 100 feet high would have to be erected within 4 or 5 miles of Warren. It is not probable that such a dam would contain more than half of the assumed quantity for one reservoir; but the railroad and oil interests through that region of the Allegheny waters, from a point below French Creek to the Connewango Valley, would forbid the construction of such a reservoir there at the present day.

"The general result of such preliminary examinations as I have been enabled to make in connection with this immediate investigation is, that on no tributary of the Allegheny can a place be found where a dam 100 feet high would be likely to pond more than half the assumed quantity of water for one reservoir.

"Taking the other confluent, the Monongahela River, considering first the Youghiogheny, its main easterly tributary, we find that its upper part is unfit for reservoir or lake purposes on a large scale, on account of its very rapid fall, which is over 10 feet per mile. In order to obtain the drainage of 600 square miles the dam would have to be as low down as its passage through Laurel Hill Ridge; but here the fall is 10 feet per mile. A dam 100 feet high would therefore back the water only 10 miles, and the pool would not probably contain more than one-fourth the entire drainage of 600 square miles. It is obvious from the fall in this river that it is not favorable for this particular plan of reservoirs, unless the dam should be located on the Lower Youghiogheny River, near its mouth, where a dam 100 feet high might flow back, say, about 40 miles, and make a pool which might contain, including the flow up its tributaries, about 15,000,000,000 cubic feet, or six-tenths of the quantity assumed for one of the lakes; but the railroad, coal, mill, farm, and town interests would cause enormous damages to be assessed, even if the people would permit its erection.

"Cheat River is still more unfavorable even than the Upper Youghiogheny, on account of its fall.

We have next the main river Monongahela, or its westerly fork, a Virginia stream, until it enters Pennsylvania, about 90 miles above Pittsburgh. The fall from Weston, Va., to the mouth of Cheat River is only about 2 feet per mile. There can not be a doubt that here will be found one of the most favorable natural locations for the construction

of a high dam which would flow over an extensive area and afford a large supply of water.

"The construction of such a dam would, however, involve the necessity of some arrangement for passing rafts and other descending craft, or compensation in some form—matters which need not be entered into more particularly in this place. If these artificial lakes are to form a part of any system for the permanent improvement of the Ohio, I have no doubt that a site somewhere along this portion of the valley of the Monongahela would be selected for one of them. There is one other place where nature seems to have shaped the ground and the strain favorably for such a purpose. It is on the upper part, but not the extreme upper end, of the Allegheny River, in the vicinity of the State line between Pennsylvania and New York. The drainage does not quite come up to the assumed area of 600 square miles; it would, however, be about 500 square miles. Here is an advantegeous site for one of the proposed high dams, as the hills approach within about half a mile of each other, and the valley immediately above widens out and continues wide, with low bottom lands, and the fall in the river and on Potato Creek is only about 2 feet per mile, forming a peculiar flat place in the Allegheny. Here, as in the case of the Monongahela, the river runs north, contrary to the general drainage of the country west of the Allegheny Mountains, which in both instances has the effect of greatly reducing the fall per mile.

"But the construction of such a dam on the Upper Allegheny would destroy all the towns, mills, houses, and farms in the valley above the dam for even 30 miles, including Smithport, the capital of McKean County, Eldred, Kingsville, Sharon, Allegheny, Millport, etc.

"Independently of damage to the improvements made by man, this location would probably be the most advantageous of any to be found on the headwaters of the Ohio. If we allow a dam 90 feet high to flow back on 30 miles, an average depth of 40 feet, on an average width of three-fourths of a mile, the quantity provided would be 25,090,560,000 cubic feet; adding one-third for the additional flow up the tributaries, 8,363,520,000 cubic feet—total, 33,454,080,000 cubic feet.

"Upon the assumed average of 12 inches available downfall of rain per annum for this part of the country, the total quantity on the 500 square miles of basin would be 13,939,200,000 cubic feet, or less than half of the probable capacity of the reservoir assumed; consequently a dam much less than 90 feet in height at the point indicated would suffice to contain the drainage. A dam 60 feet high might flow back an average of say 25 miles, seven-tenths of a mile wide, with an average depth of 20 feet, which would contain 9,757,440,000 cubic feet; add one-third for the flow up the tributaries as before, 3,252,480,000 cubic feet—total, 13,009,920,000 cubic feet.

"These rough approximations can of course only serve to aid in elucidating general features. My inference would be that a dam on the Allegheny about 60 feet high, near the State line of New York, might form a pool that would contain the drainage above it; and that its capacity would be about half of one of these six lakes assumed by the projector and advocates of the reservoir system as easily practicable. Surveys alone made specially in view of reservoirs can afford accurate data.

"In 1851 a survey was made by E. Lorraine, esq., civil engineer, for a reservoir on Anthony's Creek, in Virginia, for the James River and Kanawha Canal. The following data relating to that survey were furnished some years ago by Elwood Morris, esq., civil engineer, when advocating Mr. Ellet's plan:

"Length of pool, 9 miles; perimeter, 46 miles; average width, one-half mile; area of pond, 2,753 acres; gathering ground, 65,160 acres; mean depth (assumed), 60 feet; height of dam, 126 feet; length of dam, 395 feet. Level of outlet tunnel, 30 feet below surface of pond. Contents available in 30 feet deep, or as low as the level of the outlet tunnel, 2,948,106,510 cubic feet.

"It is possible that the assumption of 60 feet as the average depth is too great; but the other features of this locality certainly show that it is a remarkably favorable site for a reservoir. The basin drained being 102 square miles, and allowing no more than 12 inches per mile annually of available rainfall, the quantity would be 2,843,596,800 cubic feet; so that the capacity of the reservoir would be greater than the annual supply. Probably the rainfall in that part of Virginia is greater than the average on the Upper Ohio, so that it might not contain more than would fall during some years. I refer to this Anthony's Creek reservoir for a special purpose, not because it could possibly be made available in supplying the Upper Ohio River, for it could not be, but because it presents much more advantageous features than can be found combined on any of the upper tributaries of the Monongahela or Allegheny Rivers. It was adduced by the advocates of the reservoir plan for the purpose of showing how large a quantity of water might be stored up on a single tributary, and referred to as a basis for forming a general opinion of the approximate cost of securing reservoir supplies of water for the Upper Ohio River. On the other hand, the same parties presented an existing reservoir on the headwaters of the Conemaugh River in Pennsylvania, which is in the very region whence ar-

tificial supplies of water for the Upper Ohio must be derived, as showing what had already been accomplished on a small scale, compared with the much larger requirements for the Ohio River. The Conemaugh reservoir has a water-raise of 62 feet, with a capacity of 466,000,000 cubic feet. The Conemaugh reservoir is therefore only about one-sixth of the available capacity of the upper 30 feet of the Anthony's Creek reservoir, the latter having 126 feet water-raise, being double the height. Except in the two peculiar cases already described on the Upper Monongahela and the Upper Alleghany, where their courses are northwardly, diametrically opposite to the general drainage of the territory west of the Alleghany range, the headwaters of the smaller tributaries have in nearly all cases 10 feet or more fall per mile, even Anthony's Creek, at the proposed reservoir, having 14 feet per mile fall. Very few, if any, sites so advantageous as that on Anthony's Creek, except the two on the main streams just mentioned, are likely to be found on the upper tributaries above Pittsburgh. Few, if any, places occur where it would answer to erect dams 126 feet or even 100 feet high that would command drainage enough and have the capacity of the Anthony's Creek reservoir. I make this suggestion not merely on any general view of the case, but from particular personal knowledge acquired through numerous surveys made for railroads, and in connection in former times with the Pennsylvania State Canal, between Johnstown and Pittsburgh, the Erie Canal, between Erie on the lake and Beaver on the Ohio River, the French Creek Canal and Feeder, and the Monongahela slack-water navigation, between Pittsburgh and the Virginia State line. I was engaged for three years with several engineer parties in the field in surveying along the headwaters of the Alleghany for routes for the Alleghany Valley Railroad, and more recently, in 1865 and 1866, surveying routes for the Atlantic and Great Western Railroad, in the region between the western slopes of the Alleghany Mountain and the Alleghany River, and my professional duties at one time (in 1839 and 1840) required me to traverse the entire width of the State of Pennsylvania frequently, between the lake and the Virginia State line. It is due to the Deqartment as well as to myself that the grounds on which these opinions upon this important subject are based should be known. It should be understood that they have not been formed in a random manner, but have the solid foundation of practical experience in the region in question.

It is quite possible that some sites for reservoirs, with dams 50 or 60 feet in height, more favorable than the Conemaugh reservoirs, exist where the same amount of work would secure a larger supply of water, but they can not be numerous. That reservoir cost $166,000, and it was built many years ago, at a time when such works could be erected for about half their present cost. The same work would now cost probably not less than $300,000. Admit that in similar situations $300,000 might secure 500,000,000 cubic feet of water; I have seen no estimate of the cost of the proposed Anthony's Creek reservoir, but suppose it to be assumed roughly in round figures at no more than $1,000,000, and allow that it might be large enough to store up 5,000,000,000 cubic feet of water, which is probably as much as it could hold and nearly twice as much as 1 foot of rainfall on the basin drained (65,160 acres), to secure 150,000,000,000 cubic feet for the 6-feet navigation with the Conemaugh reservoir as a basis, it would require 300 reservoirs, which, at $300,000 each, would be $90,000,000. To secure the same quantity with the assumed Anthony's Creek reservoir as a basis, as above, would require 30 reservoirs, which, at $1,000,000 each, would be $30,000,000, the latter being but one-third the cost of the former. I think it is safe for all present purposes to assume that to secure a quantity of water sufficient to maintain a flow in the Ohio River at all times 6 feet depth would cost not less than $60,000,000, because, although a few sites might possibly be found more favorable than that at Anthony's Creek, it is highly improbable that on an average for thirty sites the conditions would be anything like so favorable. Indeed, without extensive surveys previously made no engineer would be justified in assuming as a certainty that the average conditions would be materially more favorable than those appertaining to the Conemaugh reservoir, in which case the cost might approximate to $90,000,000 or more, as shown.

All this is, of course, founded on the assumption that it is practicable to find the number of sites required where the construction of such reservoirs would be permissible as well as practicable.

These approximate estimates, although presenting nothing accurately, may serve to convey a general idea of the probable cost of carrying out a system of reservoirs of sufficient capacity to maintain the flow of the Ohio at or near the depth of 6 feet in the channels of the natural river. Should such a system be adopted the reservoirs or some of them would have to be found in West Virginia, in the northern part, but chiefly in Western Pennsylvania, along the head-waters of the Monongahela and Alleghany Rivers and their tributaries.

The cost and general nature of the improvements and experimental tests made upon the channel-way of the Ohio River by direction and provision of Congress are detailed

in another part of this report, prepared under the immediate supervision of the Bureau of Statistics.

The two most extensive works of this character undertaken and successfully completed by the General Government are the Louisville and Portland Canal, extending from the head to the foot of the perilous shoals at Louisville, known as the "Ohio Falls," and the great Davis Island Dam, near Pittsburgh. A full description of the canal will be found on pages 606 and 607 of the report of this Bureau upon the "Internal Commerce of the United States" for the year 1886. The enlargement of the mouth of the canal into an ice harbor or safety basin, referred to on page 607, as mentioned above, has proceeded nearly to completion, and, with a proper supply of means, can be utilized by the close of the next Gevernment fiscal year. It is estimated that this enlargement will, by preventing wreckage on the falls, enable enough salvage in ten years' time to pay its entire cost. As usual with Government work on Western rivers, this is of the most substantial character, and will endure for an almost unlimited length of time, with small charges for repairs.

Concerning the Davis Island Dam, the following extracts from the address of Hon. Daniel Agnew on the occasion of the formal opening of the dam to navigation, October 7, 1885, will provide a clear description of the work and a connected history of the enterprise itself:

"Congress by the act of March 3, 1875, appropriated to the improvement of the Ohio $300,000, of which $100,000 were to begin this work, and a board of engineers consisting of Generals Wright, Weitzel, and Poe, and Colonel Merrill, was appointed to select a site. They selected and reported this at Davis Island.

"Owing to the procrastination of Pennsylvania to pass the necessary law to confer jurisdiction over the site upon the United States, the work was not begun until August 19, 1878. Various delays occurred owing to the failure of Congress to make timely apppropriations, the law forbidding the United States officers to make contracts in advance of the appropriations.

"The delay was fortunate, as it enabled Colonel Merrill to adopt a valuable invention of Mr. Alfred Pasqueau, a French engineer. In the original chanoine system (named from its inventor, and in use on the Seine, Marne, Meuse, and other French rivers) a tripper was used to let down the wickets, which answered for short spans only. These tripper-bars were dispensed with by the use of a hurter-block, invented by Mr. Pasqueau, which can be applied to spans of great length, thus reducing the number of piers, and diminishing the danger of navigation, especially of large coal fleets. The change was made upon the report of a board of engineers, appointed at the suggestion of Colonel Merrill, to consider certain modifications in the plan of the Davis Island dam. The board consisted of Colonel Craighead, who was in charge of the Kanawha improvement, General Weitzel, Colonel Merrill, and Lieutenants Turtle and Mahan. The view of the board being concurred in, the change was formally authorized by the chief engineer, March 25, 1881, and a contract made May 24, 1881, for 141 cast iron Pasqueau hurters.

"The dam was so f r completed in the summer of 1884 that it was temporarily raised and continued up for five weeks with a satisfactory result. At the close of 1884 the total expenditures had been $828,252.85, and it was expected that the total cost would be less than $1,000,000. This includes gates, lock, and shore works. The cost of the dam proper will be about $750,000, or $437 per foot lineal.

"The following description of the dam I take from a report of Lewis M. Haupt, esq., to the Engineers' Club of Philadelphia. Says Mr. Haupt: 'The elements of a *barrage mobile* or movable dam are a wicket, a horse, a prop, and devices for manœuvering them. The wicket is merely a strong rectangular shield, or panel, of variable dimensions, hinged to an axis placed at a height of one-third the length of the wicket from the bottom of the weir and of seven-twelfths for the passes. The part of the wicket below this axis is called the breech; that above, the chase. To the same axle is hinged the head of an iron frame, called the horse, the feet of which are hinged to the floor of the pass, just behind the sill, so that when the wicket is raised, its place will be inclined down stream at an angle of 20 degrees, while the horse will be inclined up stream at an angle of 5 degrees from the vertical. The prop makes an angle with the horizon of 37 degrees. It is hinged at its upper end to the axle of oscillation of the wicket, and at the foot of it is supported by a cast iron block called a hurter, which is rigidly bolted to the dam.'

"The work upon this dam has been under the careful supervision of officers of the United States Army. In this work Captain Mahan was the chief assistant of Colonel Merrill. All the officers named deserve special mention, and a record of their skill and services in connection with a work so novel and important.

"In erecting this dam the following dimensions were adopted: Lock chamber, 600 by 110 feet clear; navigable pass (sill on river bed), 559 feet; weir No. 1 (sill 1 foot above bed), 224 feet; weir No. 2 (sill 2 feet above bed), 224 feet; weir No. 3 (sill 3 feet above bed), 216 feet.

Length of main channel, 1,223 feet, and piers included, 1,260 feet.

Number of wickets in navigable pass	139
Number in weir No. 1	56
Number in weir No. 2	56
Number in weir No. 3	54
Total	305

In navigable pass, each wicket 12 feet and 1½ inches long by 3 feet, 9 inches wide. In weir No. 1, each wicket is 11 feet 1½ inches long by 3 feet 9 inches wide. In weir No. 2, each 10 feet 1½ inches long by 3 feet 9 inches wide. In weir No. 3, each 9 feet 1½ inches long by 3 feet 9 inches wide. The wickets are spaced 4 feet apart between centers, leaving 3 inches clearance.

On the back channel is a permanent dam 456 feet long.

The dam is located about five or six miles below the "Point," or confluence of the Monongahela and Allegheny rivers, at the foot of Davis and just above the head of Long or Neville's Island. The fall of the Ohio from the foot of Market street to the dam is 6 feet. The height of the dam, from sill to crest, is 12 feet; lock length 600 feet; width 110. It will pass at once from ten to twelve barges, two flats and the tow-boat. The back water extends to dam No. 1 of the Monongahela Navigation Company, on that river, and to Garrison ripple, on the Allegheny river, nearly opposite the United States Arsenal. The depth of the pool opposite the city of Pittsburgh is 7 feet. The surface measurement of the pool, from the dam upward, is 1 square mile and 62-100, or 1 mile and 1-5. The pool touches both cities, South Pittsburgh, Birmingham and Sawmill Run, or Temperanceville. The surface capacity of the pool furnishes a haven for 12,000 boats of all classes, or 6,000, allowing for free movement.

APPENDIX.

RAILWAY BRIDGES CROSSING THE OHIO RIVER BETWEEN PITTSBURGH AND CAIRO.

The following brief descriptions of railway bridges crossing the Ohio River will be found interesting as well as instructive. Some of these are recognized masterpieces of engineering skill in overcoming immense natural difficulties, and all combined serve to illustrate the statistics of that vast commerce constantly passing over the noble stream in a reciprocal exchange of the commodities of a continent.

The bridges are arranged in this section of the report in serial order from above to below as the river runs:

THE PITTSBURGH AND LAKE ERIE BRIDGE.

The Pittsburgh and Lake Erie Railroad crosses the Ohio River at Beaver, Pa., upon a single-track iron-truss bridge. This structure is 1,341 feet in length and has an iron viaduct approach of 1,114 feet long. The channel span of the bridge is 446 feet; the bottom of the lower chord being 90 feet above low water. For a profile of the bridge see appendix. The tonnage of freights and classification of same carried over the bridge during the year 1886-'87 will be found in another part of this report devoted to that special subject.

THE STEUBENVILLE (OHIO) BRIDGE.

This bridge was erected in 1862 and 1863. It is composed of 8 spans 1,901 feet in total length. Commencing on the West Virginia shore, the spans are divided as follows, the measurements being in all cases from center to center of pier:

	Feet.
Span No. 1	233.0
2	235.7
3	235.7
4	239.7
5 (channel)	323.0
6	214.0
7	210.0
8	210.0

All these spans, except the channel span (No. 5), are deck spans. The structure was designed, built, and erected by J. H. Linville. It is a single-track structure, composed of iron, on the Linville plan, with cast-iron compression members and wrought-iron tension members. The elevation of the track is 90 feet above low-water mark, and the track is level throughout the entire length of the bridge.

Arrangements are now in progress for the renewing of this structure for double track, using wrought-iron throughout. The entire bridge is on a straight line.

Spans Nos. 1, 2, and 3 (counting from the Ohio shore) are each 210 feet from center to center of piers, and 195 feet in the clear at low-water line. Span No. 4 is over the main channel, and is 300 feet in the clear at low-water line, and 325 feet from center to center of bearing-plates on top of the piers. Spans 5, 6, 7, and 8 are each 235.7 feet from center to center of piers, and 220 feet in the clear at the water line. The channel span is an over-grade or "through" bridge, with a clear height of 90 feet above low water. The other spans are all under grade or "deck" bridges, with a clear height of 66½ feet above low water.

AT BELLAIRE.

The Ohio River bridge at Bellaire, across the river proper, consists of six spans of the Keystone pattern; four of them "deck" and two "through."

The deck spans are 209½ feet each, with a depth of truss of 24 feet 9 inches each; length of panels, 12 feet 10 inches. The channel span is 345 feet, with a depth of truss of 32 feet 10 inches, and length of panels of 15 feet 7 inches. The through spans are 237 feet 6 inches each, with a depth of truss of 25 feet 2 inches, and length of panels of 13 feet.

The approach on the Bellaire (Ohio) side is made by means of stone arcades, and on the Benwood (West Virginia) side by Bollman bridges.

This bridge has but a single track, and is owned by the Baltimore and Ohio Railroad Company.

BRIDGE AT PARKERSBURGH, W. VA.

The bridge across the river at Parkersburgh, W. Va., owned by the Baltimore and Ohio Railroad Company, carries a single track, and consists of 6 spans of the Keystone pattern.

Four of these spans are "decks," of 209 feet and 6 inches each, with a depth of truss of 24 feet, 9 inches, and length of panels of 12 feet 10 inches.

The two channel spans are 345 feet each, with the same dimensions as the channel span in the Bellaire bridge. The approaches on both sides are Ballman bridges. The Keystone bridges are all of wrought-iron. The Ballman bridges have wrought-iron beams, stringers and rods, and chord and truss posts only are of cast-iron.

THE BRIDGE AT POINT PLEASANT, W. VA.

Col. Charles K. McDermott, chief engineer of the Kanawha and Ohio Railway, is credited with the following terse description of his company's bridge across the Ohio River at Point Pleasant, W. Va.:

"The superstructure of the bridge proper is entirely of iron and steel, resting on stone-masonry piers. It has 5 spans, all of which are through or over grade. Their lengths from center to center of piers are as follows:

	Feet.
Nos. 1, 2, and 3, on the West Virginia side	250
No. 4, channel span	420
No. 5, on the Ohio side	200
Total length between end piers	1,370

"The bridge is calculated for two locomotives coupled, weighing 170,000 pounds, followed by a train of 2,240 pounds to the foot.

"Deflection 1 : 1800. The compression members are steel.

"The approaches of the bridge are iron viaducts, supported by stone-masonry pedestals.

"The West Virginia approach is 1,514 feet in length, and has a grade of $79\frac{2}{10}$ feet per mile on tangents, and 66 feet per mile on curves.

"The Ohio approach is $951\frac{9}{10}$ feet in length, and has a grade of $79\frac{2}{10}$ feet per mile. This approach joins at its northern end a substantial trestle-work of timber 1,091 feet in length, extending to the solid earth embankment.

ELEVATIONS.

	Feet.
Elevation of low water of 1881	100.00
Elevation of high water of 1881	152.06
Elevation of top of channel piers	192.6 and 192.55
Elevation of base of rail over channel piers	195.90

CONNECTIONS.

"This bridge furnishes a connection between Hampton Roads and Chicago, Toledo, and Cleveland on the lakes. The Kanawha and Ohio Railway is connected southward with the Newport News and Mississippi Valley Company's lines at Charleston, and with the Columbus, Hocking Valley and Toledo Railroad system at the northern end of the bridge, and by lease of 11 miles of that system, and the Ohio Division of the Kanawha and Ohio Railway with the Toledo and Ohio Central Railroad at Corning. By these roads and their connections the whole of Ohio, Indiana, Michigan, and other States westward are brought in rail connection with the Middle and Southeastern States of the Union and with the great harbor of Hampton Roads."

THE NEWPORT AND CINCINNATI BRIDGE.

This structure was built in 1871 by the Keystone Bridge Company. It is a combined railroad and highway bridge. On the Ohio shore there is a wooden trestle bridge of 1,130 feet in length. The remainder of the bridge is composed as follows, counting from the Ohio shore to the Kentucky shore:

	Feet.
Span A over Eggleston avenue	100
B	75
C	85
D	80
E	80
F	80
G	80
H over Front street	85
Three brick arches, total length	127
Span L	92.2
M	96
No. 1	137
No. 2 (channel)	418
No. 3	237
No. 4	260
No. 5	202.5
No. 6	202.5
N (over Front street, Newport)	43.8
O	43.8
P	43.8
Seven brick arches	182
Span Q (over Market Space)	35
Five arches and approach wall on Kentucky shore	236.6
Total length	3,022.2

The entire bridge, exclusive of the wooden trestle approach on the Ohio shore and the brick arches, is of wrought-iron. The trusses are constructed upon the old Keystone bridge plan. The grade rises from both shores to the channel span at the rate of 2 feet per 100.

The channel span is level and the track is 103 feet above low-water mark. The Ohio approach as far as span No. 1 is upon a 10 degree curve. This bridge is a single-track structure and is operated by the Pittsburgh, Cincinnati and Saint Louis Railway Com-

pany; the Cincinnati division of the Louisville and Nashville Railroad Company having a traffic privilege over it for freight and passengers.

CINCINNATI SOUTHERN RAILWAY BRIDGE ACROSS THE OHIO RIVER BETWEEN THE CITIES OF CINCINNATI, OHIO, AND LUDLOW, KY.

Mr. G. B. Nicholson, chief engineer of the Cincinnati, New Orleans and Texas Pacific Railway, sends the following description of this bridge:

"The Cincinnati Southern Railway, 336 miles long, from Cincinnati to Chattanooga, Tenn., was built and is owned by the city of Cincinnati. The road has been leased to an operating company styled the Cincinnati, New Orleans and Texas Pacific Railway Company, under a contract dated October 11, 1881, and expiring October 11, 1906.

"The bridge over the Ohio River between Cincinnati and Ludlow forms a part of the Cincinnati Southern Railway. The several spans, piers, and approaches were built under several contracts, the first of which was dated February 24, 1877. The bridge was completed December, 1877.

"On the Ohio side the bridge proper is approached by a wooden trestle 1,236 feet long, and an iron plate girder 64 feet long over Eighth street, in Cincinnati.

"The following is a list of the spans, beginning at the Cincinnati end, the dimensions being from center to center of piers:

Kind of span.	Length of span between centers of piers.	Name of contractor.	Alignment.	Grade per mile.
	Feet.			*Feet.*
Wooden trestle	614.00	Jas. Nixon	Tangent and 3 curve	79.2
Iron plate girder	64.00	Keystone Bridge Company	3 curve	79.2
Wooden trestle	621.85	M. Finnegan	do	79.2
Through Pratt	121.00	Baltimore Bridge Company	Tangent	79.2
Do	113.00	do	do	79.2
Do	117.69	do	3 curve	79.2
Through Whipple	190.00	do	do	79.2
Do	190.00	do	do	79.2
Do	191.50	do	3 curve and tangent	79.2
Do	300.00	Keystone Bridge Company	Tangent	30.0
Do	300.00	do	do	30.0
Channel span through Whipple.	519.00	do	do	Level.
Draw span through Whipple	370.00	do	do	Do.
Deck Pratt truss	110.00	do	do	Do.

	Feet.
Total length of north approach	1,299.85
Total length of bridge proper	2,522.19
Grand total	3,822.04

The clear height above low water is 102½ feet; the clear width of channel span is 500 feet; the clear width of one wing of draw span is 161½ feet; greatest depth of water in channel span at low water, 14 feet. The water-way of the Ohio River under the bridge at average stages measures 1,200 feet. The grade of the approach rises from McLean avenue, in Cincinnati, at the rate of 79.2 feet per mile along the approach and the first six spans of the bridge; thence on the next two spans it rises at the rate of 30 feet per mile until the channel span is reached. From the north end of the channel span to the south end of the bridge the grade is on a level, being the same elevation as the road-bed of the railway in Ludlow.

The piers of the bridge are of limestone masonry. All piers supporting spans over the water-way of the river have their foundations resting on the natural rock. All other piers have foundations of piles and grillage. The total cost of the bridge and approach was $802,172.04.

The bridge was originally built as a single-track railway bridge, without provision for foot or wagon travel. At the request of the citizens of Ludlow, in the year 1885 a footway 5 feet wide was constructed on the west side of the bridge outside of the truss to which it was attached. The cost of the footway was $9,295.24.

THE LOUISVILLE BRIDGE.

The most concise description of this fine structure ever published is that made by a commission of United States Engineers in a report to the Chief of Engineers, U. S. Army, and may be profitably quoted entire. The report is as follows:

"This bridge, sometimes known as the Ohio Falls bridge, is a railroad and foot bridge, and it crosses the Ohio River at the head of the falls, extending from a point just below the city of Jeffersonville, in Indiana, to the foot of Fourteenth street, in the city of Louisville. It belongs to a special bridge corporation, and serves to connect the Indiana railway system with the roads on the south of the Ohio that center at Louisville.

* * * * * * *

The bridge company was chartered by the State of Kentucky, with authority to construct a bridge that should not obstruct the navigation of the Ohio 'further than the laws of the United States, and the decisions of the Supreme Court shall hold to be legal.' Their authority from the United States is derived from the act of Congress approved February 17, 1865, which is supplementary to the act of July 14, 1862, under which the Steubenville, Bellaire, and Parkersburgh bridges are built. Under these acts the company was authorized to build any one of the three following styles of bridges, viz:

1. Continuous, 90 feet above low water.
2. With a draw, 70 feet above low water.
3. With three draws, 56 feet above low water.

The location of this bridge is peculiar, and the provisions of the act of 1862 do not apply very well. The authority to build under that act might have caused a great deal of injury to navigation had its provisions been interpreted to the letter. At the Falls of the Ohio there are really three navigable channels to be crossed—the Indiana chute, the middle chute, and the Canal, and as the act in question only contemplated one channel, an illiberal interpretation might have resulted in seriously affecting navigation through the others. Fortunately the company met the difficulties of the case in a most commendable public spirit, and they not only adopted the highest of the three bridges, but they largely increased the channel-ways that they were required to give.

* * * * * * *

The bridge, as built, belongs to the class of "high" bridges, as distinguished from bridges with draws, and an elevation of but 70 feet. It has a single railroad track and two sidewalks, each 6.2 feet wide, and its total length between abutments is 5,218⅔ feet. The spans, commencing at the abutment on the Indiana or north shore, are as follows: 99,-149.6; 180; 180; 180; 398¾ (Indiana chute); 245½; 245½; 245½; 245½; 245½; 245½; 370 (middle chute); 227; 227; 210; 210; 180; 180; 149.58; 149.58; 149.58; 149.58; 132; 132; (draw-over canal) 50.50. These dimensions are from center to center of piers, and they are greater by the half widths of two piers than the clear water-way. The trusses themselves are of the two styles patented by Mr. Albert Fink, the chief engineer of the bridge.

The two channel spaces are spanned by Fink triangular trusses, and all the others except the draw by Fink trussed girders. The drawbridge is what is generally known as a Warren girder, differing only from the triangular in that the latter has certain additional members that are necessary to adapt it to long spans. The former are through or overgrade bridges, and the latter deck or undergrade. The clear water-way at the Indiana chute, measured on the low-water line, is 380 feet, and at the middle chute, 352¼ feet. The roadway bearers of the channel spans are suspended below the bottom chords, and consequently the height under the bridge available for steam-boats must be measured to these members. The line of the roadway bearers of the Indiana channel span is 96½ feet above low water, and 45½ feet above highest water; the maximum oscillation being 51 feet. At the middle channel space the river is dry at low water, and the available space above the river bed is 90 feet. These two channel spans are on the same level, but at the Indiana channel the break in the rocky ledge is 1,000 feet above, while in the middle channel it is 6,000 feet below. The line of the crest of the falls is exceedingly irregular, crossing the line of the bridge between the two channel spans nearly at right angles.

The tops of the channel-piers and of all piers between them are 97¼ feet above low water of the Indiana chute. The others are lower, conforming to the grade of the bridge.

The foundations of all the piers of this bridge were laid on the solid rock, and therefore there is no need of any riprap protection around them.

The right pier of the Indiana channel-space is 64 feet 6 inches by 17 feet 10½ inches at bottom; thence it is carried up vertically, with 10½ inches of offsets, to 10 feet above low water. Above this the sides have the uniform batter, up to the coping, of $\frac{7}{16}$ of an inch per foot. The left pier is 65 feet 6 inches by 18 feet 8 inches at bottom, and is carried up vertically, with 1 foot 6¼ inches of offsets, to 18 feet above low water. Above this the sides have the usual batter. The up and the down stream ends of the piers are built

alike, with starlings formed by the intersections of arcs of circles with radii of 12½ feet. They are capped by hoods at high-water mark, and above this are finished with semicircular sections. These piers on top (without coping) measure 33 by 10 feet.

The piers of the middle channel are 64 by 17¾ feet at bottom, and 33 by 10 feet on top, with starlings and hoods like the other channel piers.

The other piers are similarly constructed, excepting that above the lower starlings and hoods they have another starling and hood, which makes a shorter length of pier on top. The top dimensions of pier No. 7 (without coping) are 21 by 7, the dimensions at bottom being 45⅚ by 14½.

The grades and curvatures on this bridge and its approaches are as follows, commencing at the face of the abutment on the Indiana or northern shore:

Distance.	Grade.	Curvature.	Remarks.
785.01	78.06	Tangent.....	Indiana side.
2,241.75	.....	.....do.....	Channel spans and spans between.
2,192.82	79.14	.....do.....	Kentucky side.
5,219.67			

The approach to this bridge on the Indiana shore consists of a long and high embankment. This, however, does not properly belong to the bridge, and, in accordance with the rule adopted for other bridges, we consider that we have reached the end of a bridge when we come to earth-work. Under this rule this bridge has no approaches, the entire space from abutment to abutment being water-way:

This bridge crosses the Louisville and Portland Canal 1,700 feet below the guard-lock at the head. An unobstructed passage-way for steam-boats is secured by means of a draw, giving a clear opening of 114 feet over the canal. The other end of the draw projects over a portion of the river, and by modifying the canal-bank on this side so that it shall just have the width of the pivot of the draw, it will be practicable for steam-boats in high water to ascend the river without lowering their chimneys. This is a very valuable provision for boats that habitually run where there are no bridges, which yet may occasionally wish to go above Louisville. In low water such boats can pass through the canal, and in high water by using the other end of the same draw they can pass up the river, even should they be too wide to get through the new locks. The changes in the canal-bank necessary to permit this use of the northern end of the draw are being made by the United States as a necessary adjunct to the enlargement of the canal.

The total high-water section of the river on the line of the bridge is 216,249 square feet, of which 13,573 square feet, or 6 per cent., is occupied by the piers. This contraction would probably cause no perceptible increase of velocity.

The low-water section is 1,377 square feet, of which 60 square feet, or 4½ per cent., is obstructed. All the water at this stage is running through the Indiana chute, but there being no navigation possible the effect of the piers need not be considered.

The losses by collision with the piers of this bridge, up to date, amount to $26,704.

The board have no changes to recommend in this bridge, which they consider a first-class structure throughout, and very much less an obstruction than it might have been had its builders limited themselves to giving only what they were compelled by law to give. On the contrary, they have chosen to build according to the highest of the three authorized plans, and have exceeded the heights and widths that even this plan required, spending $150,000 more than was necessary to comply with the letter of the law. Instead of a 300-foot opening at low water, one of their channel-spans gives 380 feet and the other 352¼ feet. The total cost of the bridge, from abutment to abutment, was $1,615,120.

If it should be found by experience that, owing to the peculiar location of this bridge, that the channel-space on the Indiana side can not be safely run by coal tows, then a still wider opening will be necessary. Present difficulties, however, may possibly be due to a lack of experience. Should it be found, however, that there are inevitable dangers due to this exceptional location which no amount of experience can avoid, it will be manifestly necessary to widen this span to 500 feet, or in some manner to modify existing conditions so as to facilitate the passage of the present opening.

The gradient of the track rises from the Kentucky shore at the rate of 79.14 feet per mile for a distance of 2,193 feet to the south end of the first channel span; thence for a

distance of 2,241 feet to the north end of the second-channel span, the track is level; and from that point it descends at the rate of 78.6 feet per mile to the north end of the bridge.

THE KENTUCKY AND INDIANA BRIDGE.

Some 2 miles below the head of the Falls is the Kentucky and Indiana bridge, locally known as the Sand Island bridge, which extends from Portland, on the Kentucky side, to New Albany, on the Indiana shore. This structure was built by a company of Louisville and New Albany capitalists under charters granted by the legislatures of Indiana and Kentucky, aided by Congressional sanction. Work was begun upon the superstructure on the 1st of October, 1882, and the bridge was practically completed in October, 1883.

The bridge is 2,453 feet in length, exclusive of approaches, and extends across the lower end of Sand Island near the Kentucky shore, between which and the island lies the exit channel from the lock basins of the Louisville and Portland Canal.

It has 9 piers, 7 of which are massive masonry composed of the compact oölitic limestone from the Bedford (Indiana) quarries, and the other 4 piers are of wrought iron. The average height of the masonry piers is 170 feet. The iron piers are cone-shaped cylinders made of boiler iron five-eighths of an inch in thickness, in pairs, on each side of the river, resting upon the bed-rocks and filled with brick and concrete. The two of these on the Indiana shore contain 170 cubic yards of brick and 300 cubic yards of concrete, and are 75 feet high, those on the Kentucky shore containing 385 cubic yards of brick and 446 cubic yards of concrete, and being 108 feet high.

Seven river spans are of the cantalever system, and are of the following lengths, measured from the Kentucky side: No. 1,260 feet; No. 2, 483 feet; No. 3, 360 feet; No. 4, 480 feet; No. 5, 260 feet; No. 6, 370 feet; No. 7, 240 feet. The second and seventh spans are respectively the longest cantalever span and draw in the United States.

The masonry in the piers contains 13,600 cubic yards of stone. The approaches on the Indiana side are 781 feet in length, and on the Kentucky side 3,990 feet. Six hundred thousand feet of lumber were put in the trestle-work of the Indiana approaches and 3,000,000 feet in that on the Kentucky side.

In the bridge proper 2,414,261 pounds of Bessemer steel were used, together with 3,625,000 pounds of wrought iron, and 2,000,000 feet of white-oak flooring and fencings on the deck of the bridge. The structure carries a single railway track of 4 feet 8½ inches gauge, laid with steel rails, with roadways for vehicles and foot passengers on either side, separated by stout wooden barriers, 10 feet high, from the railway track. At present the bridge is used principally for passenger traffic between Louisville and suburbs, and New Albany; but it is expected the Louisville, New Albany and Chicago, the Louisville, Evansville and Saint Louis, the Ohio and Mississippi Railroads, and the projected Louisville Southern Railroad will use it for the transfer of freights and passengers in the near future.

The entire cost of the bridge and approaches was something over $1,000,000, and the stock of the company sells in the Louisville market at an average of 70 cents.

THE HENDERSON (KY.) BRIDGE.

At Henderson, Ky., the bridge over the Ohio was begun in 1882, under the auspices of a company chartered two years previously by the legislature of Kentucky, and the work of construction and connection with the cities of Henderson and Evansville, Ind., was completed July 13, 1885.

The bridge proper is composed of the best wrought iron and steel used in combination to give the greatest strength under both tension and pressure, and the structure has a length of 3,200 feet. The superstructure consists of five spans of 120 feet each, "deck" truss; six "through" spans of 249 feet each; two "through" spans of 250 feet each, and one "through" span of 525 feet, this latter being the longest truss-span in the world.

In the construction there were used the following materials: Of steel, 1,457,040 pounds; of wrought iron, 5,752,122 pounds, and of cast iron, 115,447 pounds.

The Louisville and Nashville Railroad uses the bridge for its large Northeastern and Southwestern traffic, crossing by a single track of standard gauge, laid with steel rails weighing 58 pounds per yard.

For a profile of this bridge see the Appendix, and for a statement of north and south bound tonnage see the cross-river statistics of the Louisville and Nashville Railroad, Henderson Division.

The foregoing comprises all the bridges at present constructed across the Ohio River over which railway traffic passes.

At Cincinnati the Newport News and Mississippi Valley Railroad Company is building a bridge to carry a single track and furnish connections with Cincinnati for their Kentucky Central line. This will probably be completed and in operation by January, 1889.

At Cairo a railway bridge to cross the Ohio is under contract, which is to have two spans 518 feet each, seven 400 feet each, and three 250 feet each; total length 4,670 feet. It is to be 53 feet above high-water mark, and will cost $2,500,000. It will require two and a half years to complete it for operation.

I.—HISTORICAL NOTES.

In the early days of European discoveries and rivalries in the Mississippi Valley its comprehensive river system played a prominent part on the stage of public affairs. The discovery of the river, in 1541, by De Soto and his Spanish troops was about a century later followed by explorations by the French under the lead of Marquette, Joliet, La Salle, and others, who entered the valley from the north. La Salle, during the years 1679–1683, explored the river throughout its whole length, took possession of the great valley in the name of France, and called it Louisiana in honor of his King, Louis XIV. Then resulted grand schemes for developing the resources of the valley, which a French writer characterized as "the regions watered by the Mississippi, immense unknown virgin solitudes which the imagination filled with riches." One Crozat, in 1712, secured from the king a charter giving him almost imperial control of the commerce of the whole Mississippi Valley. There was at that date no European rival to dispute French domination, for the English of New England and the other Atlantic colonies had not extended their settlements westward across the Alleghanies, and the Spanish inhabitants of New Spain or Mexico had

not pushed their conquest farther north than New Mexico. Crozat's trading privileges covered an area many times larger than all France, and as fertile as any on the face of the earth. But he was unequal to the opportunity, and, failing in his efforts, soon surrendered the charter.

John Law, a Scotchman, at first a gambler, and subsequently a bold, visionary, but brilliant financier, succeeded Crozat in the privileges of this grand scheme, and secured from the successor of Louis XIV a monopoly of the trade and development of the French possessions in the valley. In order to carry out his wild enterprise he organized a colossal stock company, called "The Western Company," but more generally known in history as "The Mississippi Bubble." According to the historian Monette "it was vested with the exclusive privilege of the entire commerce of Louisiana and New France, and with authority to enforce its rights. It was authorized to monopolize the trade of all the colonies in the provinces, and of all the Indian tribes within the limits of that extensive region, even to the remotest source of every stream tributary in anywise to the Mississippi." So skillful and daring were his manipulations that he bewitched the French people with the fascinations of stock gambling. The excitement in Paris is thus described by Thiers: "It was no longer the professional speculators and creditors of the government who frequented the rue Quincampoix; all classes of society mingled there, cherishing the same illusions—noblemen famous on the field of battle, distinguished in the government, churchmen, traders, quiet citizens, servants whom their suddenly-acquired fortune had filled with the hope of rivalling their masters."

The rue Quincampoix was called the Mississippi.

The month of December was the time of the greatest infatuation. The shares ended by raising to eighteen and twenty thousand francs—thirty-six and forty times the first price.

At the price which they had attained the six hundred thousand shares represented a capital of ten or twelve billions of francs.

But the bubble soon burst and its explosion upset the finances of the whole kingdom.

Some years later, in 1745, a French engineer named Deverges made a report to his government in favor of improving the mouth of the Mississippi, and stated that the bars there existing were a serious injury to commerce.

But France met with too powerful rivalry in the valley, and in 1762 and 1763, after a supremacy of nearly a hundred years, was crowded out by the English from the Atlantic colonies, and the Spaniards from the southwest, the Mississippi River forming the dividing line between the regions thus acquired by those two nations.

The Spanish officials, for the purpose of promoting colonization, and to aid in establishing trading posts on the Mississippi, Missouri, Arkansas, Red, and other rivers in the western half of the valley, granted to certain individuals, pioneers, and settlers, large tracts of land. They made little progress, however, in peopling their new territory.

But whatever progress was made under the successive supremacies of France and Spain, the Mississippi and its navigable tributaries supplied the only highways of communication and commerce.

In the year 1800, soon after Napoleon I became the civil ruler of France, he sought to add to the commercial glory of his country by reacquiring the territory resting upon the Mississippi which his predecessors had parted with in 1763.

To quote the language of a French historian: "The cession that France made of Louisiana to Spain in 1763 had been considered in all our maritime and commercial cities as impolitic and injurious to the interests of our navigation, as well as to the French West Indies, and it was very generally wished that an opportunity might occur of recovering that colony. One of the first cares of Bonaparte was to renew with the court of Madrid a negotiation on that subject." He succeeded in these negotiations, and by the secret treaty of St. Ildefonso, in 1800, French domination was once more established over the great river.

Two years later the commerce of the river had grown to large proportions. Says Marbois, of that period, "No rivers of Europe are more frequented than the Mississippi and tributaries." A substantially correct idea of their patronage may be obtained from the record of the foreign commerce from the mouth of the Mississippi, for nearly all of the commodities collected there for export had first floated down the river. Of the year 1802, says Martin in his history of Louisiana: "There sailed from the Mississippi—

	No.	Tons.
American vessels	158	21,383
Spanish vessels	104	9,753
French vessels	3	105
Total	265	31,241

"The tonnage of vessels that went in ballast, not that of public armed ones, is not included. The latter took off masts, yards, spars, and naval stores."

This growing commercial movement down the river of the products of the valley was checked by a foolish or arbitrary order issued on the 16th of October, 1802, by the Intendant Morales, "suspending the right of deposit" at the port of New Orleans.

Marbois well illustrates the intense indignation at this order on the part of the Western people by attributing to them the following language: "The Mississippi is ours by the law of nature; it belongs to us by our numbers, and by the labor which we bestowed on those spots which before our arrival were desert and barren. Our innumerable rivers swell it and flow with it into the Gulf Sea. Its mouth is the only issue which nature has given to our waters, and we wish to use it for our vessels. No power in the world shall deprive us of this right."

Of Morales's order James Madison, then Secretary of State, wrote to the official representative of the United States at the court of Spain: "You are aware of the sensibility of our Western citizens to such an occurrence. This sensibility is justified by the interest they have at stake. The Mississippi to them is everything. It is the Hudson, the Delaware, the Potomac, and all the navigable rivers of the Atlantic States formed into one stream."

At this time Thomas Jefferson was President, and in view of the uneasiness of the Western settlers he hastened to send to France a special embassador to negotiate for the purchase of Louisiana Territory. The opportunity was a favorable one, for France was then in danger of a conflict with Great Britain. The latter country had become alarmed at and jealous of Bonaparte's commercial conquests, and he, apprehending war and fearing that he could not hold Louisiana, had about determined to do the next best thing—dispose of it to one of England's rivals.

Marbois, the historian of Louisiana, from whom we have above quoted, was chosen by Napoleon to represent France in the negotiations with the representative of the United States sent by Jefferson. His account of the cession—the consultation between Napoleon and his minister—and of his remarks and motives, forms one of the most instructive and interesting chapters of modern history. Napoleon foreshadowed his action by the following remark to one of his counselors: "To emancipate nations from the commercial tyrany of England it is necessary to balance her influence by a maritime power that may one day become her rival; that power is the United States. The English aspire to dispose of all the riches of the world. I shall be useful to the whole universe if I can prevent their ruling America as they rule Asia."

In a subsequent conversation with two of his ministers, on the 10th of April, 1803, on the subject of the proposed cession, he said, in speaking of England: "They shall not have the Mississippi which they covet."

In accordance with this conclusion, on the 30th day of the same month the sale was made to the United States. When informed that his instructions had been carried out and the treaty consummated, he remarked: "This accession of territory strengthens forever the power of the United States, and I have just given to England a maritime rival that will sooner or later humble her pride."

Under the stimulating influence of American enterprise the commerce of the valley rapidly developed. In 1812 it entered upon a new era of progress by the introduction for the first time upon the waters of the Mississippi of steam transportation.

The river trade then grew from year to year, until the total domestic exports of its sole outlet at the seaboard—the port of New Orleans—had during the fiscal year 1855–'56 reached the value of over $80,000,000. Its prestige was then eclipsed by railways, the first line reaching the Upper Mississippi, at Saint. Louis, in 1857. Says Poor: "The line first opened in this State from Chicago to the Mississippi was the Chicago and Rock Island, completed in February, 1854. The completion of this road extended the railway system of the country to the Mississippi, up to this time the great route of commerce of the interior. This work, in connection with the numerous other lines since opened, has almost wholly diverted this commerce from what may be termed its natural to artificial channels, so that no considerable portion of it now floats down the river to New Orleans." The correctness of this assertion may be seen by reference to the statistics of the total domestic exports of New Orleans during the year ending June 30, 1879. They were $63,794,000 in value, or sixteen millions less than in 1856, when the rivalry with railways began.

But since 1879 the river has entered upon a new and important era. The successful completion of the jetties by Capt. James B. Eads inaugurated a new era of river commerce and regained for it some of its lost prestige.

Another step of great importance to the welfare of the Mississippi was taken about the same time. The control of its improvement was transferred by Congress to a board of skilled engineers known as the Mississippi River Commission. The various conflicting theories of improvement which have for years past done much to defeat the grand consummation desired will now be adjusted in a scientific and business-like manner.

Again, the rapidly growing popular demand throughout the United States for more intimate commercial relations with Mexico, and the several sister nations of Central and South America, which lie opposite the mouth of this great river system, is stimulating the long-neglected longitudinal trade and thereby creating a new demand for transportation on the longitudinal water-ways which comprise the Mississippi and its tributaries.

The practical extension of the Mississippi to the Pacific Ocean by the coming opening of an inter-ocean canal, or ship-railway, across the Isthmus of Central America, or Tehuantepec, is still another commercial departure which will soon make a new demand for water transportation up and down the Mississippi Valley.

In view of this tendency of American commerce and transportation a general or bird's-eye view of the Mississippi, its tributaries, supplements, and national and international features will, it is thought, be of value to the producers and consumers who are so deeply interested in the subject of cheap transportation between the great interior and the seaboard.

II.—DESCRIPTIVE NOTES.

EXTENT AS A DRAINAGE SYSTEM.

The Mississippi and tributaries, considered as a drainage system, extend nearly the whole length of the United States, from Canada to the Gulf, and across more than half its width, or from the summit of the Rocky Mountains to that of the Alleghanies.

The Mississippi basin, in its strict sense, comprises the following minor basins, or subdivisions:

Basin.	Square miles.	Basin.	Square miles.
Lower Mississippi	65,646	Upper Mississippi	179,635
Red	92,721	Ohio	207,111
Arkansas	184,742		
Missouri	527,690	Total	1,257,545

Of the many divisions and subdivisions of the river two hundred and forty are considered of sufficient importance to be named upon the river map in Walker's Statistical Atlas of the United States. They may be classified as follows:

Red and tributaries	17
Arkansas and tributaries	28
Missouri and tributaries	76
Ohio and tributaries	58
Others not included in the above classification	61
Total	240

Probably as many more streams of minor importance are omitted from the map.

EXTENT AS COMMERCIAL HIGHWAYS.

Considered from a commercial standpoint the Mississippi and tributaries intersect or border twenty-one States and Territories, as follows:

Alabama.	Kansas.	Nebraska.
Arkansas.	Kentucky.	Ohio.
Dakota Territory.	Louisiana.	Pennsylvania.
Illinois.	Minnesota.	Tennessee.
Indiana.	Mississippi.	Texas.
Indian Territory.	Missouri.	West Virginia.
Iowa.	Montana Territory.	Wisconsin.

Steamers can now transport freight in unbroken bulk from St. Anthony's Falls to the Gulf of Mexico, a distance of 2,161 miles, and from Pittsburgh to Fort Benton, Mont., 4,333 miles.

Lighter craft can ascend the Missouri to Great Falls, near where that river leaves the Rocky Mountains.

The outline map preceeding Chapter I has been prepared to illustrate the comprehensive nature of this great river system. Its Briarean arms reach out in all directions and embrace nearly the whole United States.

The cross-mark on each stream indicates the head of navigation, and in nearly every instance continuous navigation.

The following table represents the mileage of the navigable portion of each above its mouth:

Name of river.	Miles.	Name of river.	Miles.
Missouri	3,127	Cache (Ark.)	160
Mississippi	2,161	Macon	130
Ohio	1,021	Alleghany	123
Red	986	Deer Creek	116
Arkansas	884	Monongahela	110
White	779	Kentucky	105
Tennessee	759	Kanawha	94
Cumberland	609	Muskingum	94
Yellowstone	474	Tensas	92
Ouachita	384	Iowa	80
Wabash	365	Current	80
Osage	303	Big Hatchie	75
Minnesota	295	Rock	64
Bœuf	280	Black (La.)	61
Sunflower	271	Chippewa	57
Illinois	270	St. Croix	55
Yazoo	228	Big Horn	50
Bartholomew	213	Clinch	50
Black (Ark.)	212	Little Red	49
Green	200	Big Cypress and Lake	44
St. Francis	180	Big Black	35
Tallahatchie	175	Dauchite	33
Wisconsin	160		

The total present navigation of these rivers—45 in all—is 16,090 miles—more than four times the length of the ocean line from New York to Liverpool, and more than four times the distance by rail, across the continent, from New York to San Francisco.

But it will be largely increased in the near future, when certain proposed and needed improvements are made on some of the upper streams. The possibilities in this respect are well illustrated by the condition of the Upper Mississippi. Of it the Select Committee of the United States Senate on Transportation Routes to the Seaboard said, in their report in 1874: "The Mississippi has for several years been successfully navigated by steam-boats from the falls of Saint Anthony to Sauk Rapids, a distance of 78 miles. During navigable seasons small steam-boats are also run on the various reaches of the river from Minneapolis to Leech Lake, the entire distance being about 675 miles."

It is safe to assert that by improving several tributaries the total navigation may be extended at least 1,000 miles.

VALLEY STATES AND TERRITORIES.

As we will have occasion, upon subsequent pages, to give statistics in regard to the 16 valley States and Territories, and also the 21 States and Territories intersected by the navigable portions of this great river system, it may be well to define the term valley. It comprises the following States and Territories:

Arkansas.	Kansas.	Nebraska.
Dakota.	Kentucky.	Ohio.
Illinois.	Louisiana.	Tennessee.
Indiana.	Minnesota.	Wisconsin.
Indian Territory.	Mississippi.	
Iowa.	Missouri.	

Strictly speaking, a fractional part of a few of these States might be omitted from, and portions of other States included in, the term valley; but as the statistics which we will have occasion to review are arranged by States we will not attempt to include those fractional parts, but will deal simply with facts relating to whole States.

INTERNAL SUPPLEMENTS.

Extensive and comprehensive as are the water-ways of the valley, they are not sufficient to satisfy the popular and commercial demand for inland water transportation. Many artificial extensions have already been constructed, and more are projected or proposed.

The waters of the Mississippi have a present connection with the Great Lakes by means of a canal from the Wisconsin River to Fox River and Lake Michigan by a canal from the Wabash River to Lake Erie at Toledo, a canal from the Ohio River at Cincinnati to to Lake Erie at Toledo, and a canal from the Ohio River at Portsmouth, Ohio, to Lake Erie at Cleveland—all of which canals are in turn supplemented by the water route via the Lake Erie Canal and Hudson River to New York City, thereby uniting the Mississippi with the Atlantic Ocean.

These four canals, and consequently the Mississippi, have another connection with the Atlantic by way of the lakes, Welland Canal, around Niagara Falls and St. Lawrence River, for the Canadian Government has at a great cost completed the necessary connecting link.

It is also proposed to unite the Mississippi with Lake Michigan by means of a canal extending from Davenport, Iowa, to Hennepin, on the Illinois River, and thence to Chicago.

Again, it is proposed that the United States utilize the St. Lawrence route by extending it to New York City by way of Lake Champlain and Hudson River. Such a connection has already been favorably reported on by the Select Committee of the United States Senate on Transportation Routes to the Seaboard. A noticeable feature of this route is the connection in this way of the Mississippi Valley with a New England State, Vermont.

It is also proposed to unite the waters of the Mississippi and the Lakes with the Atlantic at Baltimore by means of a canal from the existing Erie Canal, via Seneca Lake, to an upper tributary of the Susquehanna, and thence to Chesapeake Bay.

Again, a direct connection of the Mississippi with the Atlantic at Baltimore, without use of the Lakes, is proposed by way of the Alleghany River from Pittsburgh, the Kiskiminetas and Conemaugh Rivers, thence to the Juniata valley and the Susquehanna, and down that river to Chesapeake Bay. A similar connection with Philadelphia is proposed by the same route from Pittsburgh to the Susquehanna, and thence across to Delaware Bay.

Located a little further south is the line of the projected and partially constructed Chesapeake and Ohio Canal, intended to connect the Atlantic with the West by way of the Potomac, Youghiogheny, Monongahela, and Ohio Rivers. The line is already completed from Washington to Cumberland. It was earnestly advocated by President Washington, who wished in this way to strengthen the political and commercial ties between the Atlantic States and the West.

Next is the proposed James River and Kanawha Canal, to connect the Atlantic with the Mississippi Valley by way of the James, Greenbrier, New, Kanawha, and Ohio Rivers. This route is already constructed from Richmond to Buchanan, Va., a distance of 197 miles. It was recently recommended by the said Senate Committee on Transportation Routes.

Still further south it is proposed to supplement the Mississippi by means of a water line from the Tennessee River, at Guntersville, East Tennessee, via Short Creek, Wills Creek, Coosa, Etowah, and Ocmulgee Rivers, and thence along the coast to Savannah, Ga. This route was also recommended by the Senate Committee on Transportation Routes.

In the far West it is proposed to unite the waters of the Upper Missouri and Columbia Rivers, thereby connecting the Mississippi Valley with the Pacific Ocean. A bill to provide for a survey and report upon this route has recently been introduced in Congress.

These various existing and proposed supplements may be seen by a reference to the map preceding Chapter I.

INTER-OCEAN SUPPLEMENTS.

To consummate the new commercial movement down the river and direct trade relations with the foreign countries around the Atlantic and Pacific Oceans two other great works are needed—inter-ocean transit across Florida on the one side, and the Isthmus of Tehuantepec on the other. The natural relations of both enterprises to the Mississippi are most intimate. Each may appropriately be termed a supplement or extension of the river.

The proposed Florida ship canal will shorten the distance between New Orleans and New York 571 statute miles each way, or 1,142 on the round trip. It will shorten the voyage between New Orleans and Liverpool 473 statute miles each way, or 946 on the round trip.

The great saving of distance via this route, together with its advantages in point of safety over the present hazardous route around the southern extremity of Florida, will render it a material aid to the Mississippi in preventing the acquisition by Canada of the grain transportation business between the valley and Liverpool.

On the 18th of December, 1880, Mexico entered into a contract with Capt. James B. Eads for the construction of a ship-railway across the Isthmus of Tehuantepec.

This inter-ocean line, when completed, will give the Gulf of Mexico and its surroundings their first direct commercial outlet to the Pacific Ocean and its surrounding countries, with the following saving of distances over the existing railway at Panama and the existing steam-ship route around Cape Horn:

	Statute miles.
Mouth of the Mississippi to Hong-Kong:	
Via Isthmus of Tehuantepec (great circle)	10,092
Via Isthmus of Panama (great circle)	11,912
Saving via Tehuantepec (one way)	1,820
Saving via Tehuantepec (round trip)	3,640
Mouth of the Mississippi to Hong-Kong:	
Via Isthmus of Tehuantepec (great circle)	10,092
Via Cape Horn (great circle)	20,594
Saving via Tehuantepec (one way)	10,502
Saving via Tehuantepec (round trip)	21,004
Mouth of the Mississippi to Yokohama:	
Via Isthmus of Tehuantepec (great circle)	8,549
Via Isthmus of Panama (great circle)	10,369
Saving via Tehuantepec (one way)	1,820
Saving via Tehuantepec (round trip)	3,640
Mouth of the Mississippi to Yokohama:	
Via Isthmus of Tehuantepec (great circle)	8,549
Via Cape Horn (great circle)	20,018
Saving via Tehuantepec (one way)	11,469
Saving via Tehuantepec (round trip)	22,938
Mouth of the Mississippi to Sydney, Australia:	
Via Isthmus of Tehuantepec (great circle)	9,188
Via Isthmus of Panama (great circle)	10,341
Saving via Tehuantepec (one way)	1,153
Saving via Tehuantepec (round trip)	2,306
Mouth of the Mississippi to Sydney, Australia:	
Via Isthmus of Tehuantepec (great circle)	9,188
Via Cape Horn (great circle)	14,975
Saving via Tehuantepec (one way)	5,787
Saving via Tehuantepec (round trip)	11,574
Mouth of the Mississippi to San Francisco:	
Via Isthmus of Tehuantepec	3,466
Via Isthmus of Panama	5,302
Saving via Tehuantepec (one way)	1,836
Saving via Tehuantepec (round trip)	3,672
Mouth of the Mississippi to San Francisco:	
Via Isthmus of Tehuantepec	3,466
Via Cape Horn	15,908
Saving via Tehuantepec (one way)	12,442
Saving via Tehuantepec (round trip)	24,884

III.—ECONOMICAL FEATURES.

CORRECT LOCATION.

Railroads and other highways intended for the accommodation of commerce fall far short of success when unwisely located. Too many have violated the laws of political economy in this respect, and have proved ruinous to their stockholders and almost useless to the public. A nation may sometimes, for political or military purposes, construct a road through a desert or mountainous and unproductive region; but necessity, instead of economy, is the theory on which it acts. Commerce is governed by other considerations. It seeks that which is both useful and profitable.

The Mississippi and tributaries intersect the most fertile valley of the whole world—the productive center of this continent. It supplies transportation where most needed, and is, therefore, most wisely and economically located.

CONNECTION OF OPPOSITE CLIMATES.

Railways in the past have given undue attention to commercial exchanges along parallels of latitude, between similar climates, with similar products and characteristics. The tendency of the whole Mississippi River system is the other way from north to south, one climate to another, regions which are the reverse and complement of each other in supply and demand. In this respect also it observes a fundamental law of trade.

CONSTRUCTION BY NATURE.

The next important consideration in a transportation line is the cost of construction. Railway stockholders expect dividends, and if their roads be extravagantly built the burden is soon shifted to the shoulders of the producer and consumer along the way in the shape of excessive rates. Even if rightly located and cheaply built, railroads represent enormous capital when contrasted with rivers made by nature at no expense to the people.

The 16,090 miles of navigable water-ways which constitute the commercial part of the Mississippi River system were constructed and presented by nature at no cost to the people. But they are just as valuable as if artificially built. They are the nation's property, and should, like its military roads, its custom-houses, post-offices, and other property, be kept in repair. Congress is the board of management for this purpose, and should, in guarding the people's transportation property, exercise the same skill and observe the same laws of economy as railway directors who are chosen to manage the railway lines owned by individual stockholders.

COMMERCIAL VALUE.

There were, during the census year 1880, 87,782 miles of railways in operation in the United States, built at a total cost, for construction, of $4,112,367,176, or an average of $46,848 per mile.

Now, in view of the facts and figures showing the superior and economical location of the Mississippi and its navigable tributaries, their wonderful commercial capacity, their facilities for cheap transportation, the enormous annual products of the twenty-one States and Territories intersected, and the colossal proportions of their internal commerce, it may not be unreasonable to estimate their actual commercial value as follows:

The Lower Mississippi, from Saint Louis to the Gulf, at $468,480 per mile, or ten times the average cost per mile of the railways of the United States.

The Upper Mississippi, from Saint Louis to St. Anthony's Falls, at $327,936 per mile, or seven times that of the average railway.

The Ohio, from its mouth to Pittsburgh, the Missouri, from its mouth to Sioux City the Red River, from its mouth to Shreveport, and the Cumberland, from its mouth to Nashville, at $234,240 per mile, or five times that of the average railway.

The remaining navigable tributaries of the Mississippi at $46,848 per mile, or the same as that of the average railway.

We have then a total valuation as follows:

The Lower Mississippi, from Saint Louis to the Gulf (1,352 miles)	$633,387,664
The Upper Mississippi, from Saint Louis to St. Anthony's Falls (809 miles)	265,300,224
The Ohio, from its mouth to Pittsburgh (1,021 miles)	239,159,040
The Missouri, from its mouth to Sioux City (1,019 miles)	238,690,560
The Red, from its mouth to Shreveport (456 miles)	106,813,440
The Cumberland, from its mouth to Nashville (209 miles)	48,956,160
The remaining navigable tributaries of the Mississippi (10,774 miles)	522,542,592
Total value	2,054,849,680

In other words, the people of the United States have in the Mississippi and its forty-four navigable tributaries, highways of commerce and cheap transportation to the seaboard to the enormous value of $2,000,000,000. This property was a present from nature. The question naturally arises, will they manage it on business principles and keep it in an adequate state of repairs?

COST OF REPAIRS.

The total sum expended by the General Government from March 4, 1789, to June 30, 1886 (a period of ninety-seven years), in the improvement of the Mississippi and its forty-four navigable tributaries, was in round numbers about $51,000,000.

The expenditures by rivers, compiled and rearranged from the official reports of the Treasury Department, are as follows:

Name.	Amount.	Name.	Amount.
Mississippi	$29,785,666	Cumberland	722,479
Ohio	5,048,348	Kentucky	709,998
Missouri	2,866,965	Wabash	487,500
Tennessee	2,816,456	Arkansas	420,076
Kanawha	1,749,000	Monongahela	303,600
Red	1,443,793	Ouachita	290,000
Illinois	1,161,000	Osage	189,994

Name.	Amount.	Name.	Amount.
Yazoo	$143,000	Cache	
White	142,000	Macon	
Chippewa	128,000	Deer Creek	
Minnesota	117,500	Iowa (see Miscellaneous).	
Muskingum	110,000	Big Horn	
Yellowstone	100,000	Little Red	
Cypress and Lake	94,000	Dauchite	
St. Croix	75,000	*Miscellaneous.*	
Black (Arkansas)	51,000		
Allegheny	50,000	Fox and Wisconsin	$2,579,522
Sunflower	42,000	Mississippi, Ohio, Missouri, and Arkansas	2,484,937
St. Francis	27,000	Mississippi and Ohio	631,500
Black (Louisiana)	25,000	Mississippi, Missouri, and Arkansas	265,000
Tallahatchie	24,000	Mississippi, Missouri, and Ohio	222,923
Clinch	21,000	White and St. Francis	132,000
Big Hatchie	19,000	Mississippi and Missouri	98,541
Bartholomew	18,000	Lower Mississippi and tributaries	11,855
Bœuf	15,000	White, Black, and Little Red	10,000
Tensas	$7,000	White, Black, and St. Francis	1,623
Current	7,000	Des Moines and Iowa	999
Big Black (Mississippi)	5,000		
Rock	934	Total	55,654,209
Green			
Wisconsin (see Miscellaneous).			

A slight deduction should be made from the grand total, as Fox River, included in the list, is not a tributary of the Mississippi; but as its appropriation is combined with that of the Wisconsin, which is a tributary, the two can not be separated. Another slight deduction, probably about $3,000,000, should be made from the total for unexpended balances carried to the surplus fund, but this deduction can not be given by rivers. Estimating the two deductions at $4,000,000, we have as a net total of expenditures for the improvement of the Mississippi and navigable tributaries $51,654,209. This is at the rate of $532,515 per year during the ninety-seven years since the beginning of the Government for the improvement of forty-five rivers, navigable to the extent of 16,090 miles, or at the rate of $33 per mile per year.

As the commercial value of these forty-five rivers is, on a previous page, estimated at $2,054,849,680, the total cost of repairs during the ninety-seven years was but one-fourth of 1 per cent. of their value, or at the rate of one four-hundredth of 1 per cent. of their value per year.

In brief, the forty-five rivers cost nothing, being a present from nature, and their repairs next to nothing.

COMMERCIAL CAPACITY.

The enormous capacity of the Mississippi and its principal tributaries for the transportation of bulky agricultural, forestry, and mineral products of the States intersected was admirably illustrated by the following paragraph which appeared in the Western papers in 1879. It is a volume in itself, and worthy of frequent repetition to impress upon the minds of the producers of this country the great commercial importance of the water ways with which they have been so liberally endowed by nature:

"The towboat *Josh Williams* is on her way to New Orleans with a tow of thirty-two barges, containing 600,000 bushels (76 pounds to the bushel) of coal, exclusive of her own fuel—being the largest tow ever taken to New Orleans or anywhere else in the world.

"Her freight bill, at 3 cents per bushel, amounts to $18,000.

"It would take 1,800 cars of 333 bushels to the car (which is an overload for a car) to transport this amount of coal.

"At $10 per ton, or $100 per car, which would be a fair price for the distance by rail, the freight bill would amount to $180,000, or $162,000 more by rail than by river.

"The tow will be taken from Pittsburgh to New Orleans in fourteen or fifteen days.

"It would require one hundred trains, of eighteen cars to the train, to transport this one tow of 600,000 bushels of coal, and even if it made the usual speed of fast freight lines it would take one whole summer to put it through by rail.

"This statement shows the wonderful superiority of this river over rail facilities."

CHEAP TRANSPORTATION.

The question of cheap transportation has during late years assumed great importance, for the reason that it affects both internal and foreign commerce and the welfare of both the producer and consumer. When the rates are too high, production is checked. It has been no unusual thing to hear of farmers in the West burning or otherwise destroying their grain because it was unprofitable to ship it abroad. The object of commercial

exchanges is profit, and where that does not exist internal commerce suffers. So with foreign exchanges. If England and France and other purchasers of our grain and provisions can buy at cheaper rates elsewhere they are sure to do so. The competition among commercial nations is so great that a trifling overcharge in rates of transportation may cost the loss of an important market.

The rivals of the United States will, if they can supply Liverpool at cheaper rates, control that market. The subject was well illustrated in a public letter by ex-Governor Horatio Seymour in the fall of 1878, who has carefully studied the effect of the Erie Canal on freight rates. We quote the following from that letter: "Those who wish to learn the causes of our present exports must compare the cost of carrying this season with that of other years. It has been 15 cents for a bushel of wheat by canal from Buffalo to New York. This season at times it has been less than 5 cents. The cost from Chicago to New York has been 25 cents for a bushel. In the past summer it has been taken for less than 7 cents. The policy of taking charges off from commerce is not only shown upon water routes; it brought down railroad charges. In 1873 the Central road charged for taking wheat from Buffalo to New York 21 cents per bushel in the winter, and 18 cents in the summer months. This year the road has taken it for 5 cents."

The effect of water transportation is direct and indirect. In other words, it furnishes the shipper with cheap rates, and also, by its competitive influence, forces railways to lessen the charges.

The rates of transportation of grain from the center of the Mississippi Valley at Saint Louis to the seaboard at New Orleans by river contrasted with the rates from Saint Louis to New York by rail were, according to the annual reports of the Saint Louis Chamber of Commerce, as follows during the past ten years:

Year.	Average rate on wheat, in bulk, in barges, by river, to New Orleans, per bushel.	Average rate on grain, in sacks, on steamboat, by river, to New Orleans, per 100 pounds.	Average rate on grain by rail to New York, per 100 pounds.
	Cents.	*Cents.*	*Cents.*
1877	8⅛	21	41
1878	7¼	17½	38
1879	7¾	18	33⅛
1880	8¼	19	42
1881	6	20	82
1882	6 5/12	20	29½
1883	5½	17¾	33
1884	6⅝	14	26
1885	6⅜	15	22½
1886	6½	16	29

It will be observed that the rate on grain by river to the seaboard at New Orleans during 1886 was 13 cents less per hundred pounds than by rail to the seaboard at New York. To appreciate the magnitude of this difference when applied to the grain crop of the twenty-one States and Territories intersected by the Mississippi and its navigable tributaries, supposing half of the annual crop had to be transported from Saint Louis to the seaboard, let us glance at a few statistics.

Their total grain crop during the year 1885 was 2,529,781,000, as may be seen by reference to another page. A saving of 7 cents per bushel on half of this crop would amount to $88,542,335.

But grain is only one item of the agricultural freights of the valley, which can best be transported by water. If to the above sum of $88,542,335 were added the possible annual saving by river transportation on the hay, coal, potatoes, cotton, tobacco, and other bulky products of the valley, the total would reach immense proportions.

We know of no better conclusion to draw from the above facts and figures than that made by the Select Committee of the United States Senate, in 1874, on Transportation Routes to the Seaboard, after a full and exhaustive review of that important subject, viz: "The above facts and conclusions, together with the remarkable physical adaptation of our country for cheap and ample water communication, point unerringly to the improvement of our great natural water ways and their connection by canals, or by short freight railway portages, under control of the Government, as the obvious and certain solution of the problem of cheap transportation."

The importance of this subject may be further illustrated by a glance at the total freight earnings of the railroads of the United States during a period of only six years. They were as follows:

1881	$551,968,477
1882	506,367,247
1883	549,756,695
1884	502,869,910
1885	519,690,992
Total	2,630,653,321

In other words, the freight charges by the railways of the United States amount in five years to a sum greater than the whole national debt.

We do not make these comparisons for the purpose of reflecting upon railways, but to reach some statistical conclusions in regard to the value and importance of the rivers of the valley. In this broad, fertile, and but partially developed country there is room enough for both classes of highways. Railways are needed, not only those now in operation, but many more, and rivers are needed as freight regulators.

In brief, the Mississippi is the balance-wheel which is destined to regulate the railway freight movements of the great interior of the nation. This idea was well expressed in the following editorial of the Springfield Republican, of December 13, 1880:

"The Misssissippi River is certain in time to play a part in regulating transcontinental freight transportation not unlike that of the Erie Canal in relation to the New York railroads. The block in through freight on all the East and West roads threatened last week to set back to Saint Louis, but it was relieved there by starting the corn and wheat down the river, from 300 to 400 cars at a time being loaded on barges. As trade develops and navigation improves it is plain this must become more and more common, and through rail rates will some day be fixed by the competition of the Mississippi, on which navigation is never closed."

IV.—PRODUCTS OF STATES INTERSECTED.

CONTRAST WITH THOSE OF THE UNITED STATES.

The transcendent commercial importance of the water-ways of the Mississippi and its 44 navigable tributaries can best be appreciated by a glance at the statistics of the great staple products of the twenty-one States and Territories intersected or bordered by this system.

Their products, contrasted with those of the whole United States, during the last census year (1880) were as follows:

Products.	Per cent.	Products.	Per cent.
Sugar	98	Hay	60
Coal	94	Forest products	57
Corn	89	Wool	56
Pig-iron	81	Swine	82
Oats	76	Mules	77
Wheat	74	Horses	74
Cotton	68	Cattle	73
Tobacco	66		

Their total grain product during the year 1885 was as follows, in bushels:

Products.	Bushels.	Products.	Bushels.
Indian corn	1,729,924,000	Rye	15,464,000
Oats	514,100,000	Buckwheat	5,655,000
Wheat	241,722,000		
Barley	22,916,000	Total	2,529,781,000

In other words, the States and Territories tapped by the navigable portions of the Mississippi River system produced grain to the extent of 45 bushels for every man, woman, and child in the United States, estimating the population that year at 55,000,000 souls. They are, then, not only the granary of the nation, but of the world.

V.—INTERNAL COMMERCE OF THE STATES INTERSECTED.

ESTIMATE OF ITS VALUE.

It is, of course, difficult to estimate the value of the internal commerce of the twenty-one States and Territories under consideration, for, unlike foreign commerce, it is not subject to the laws and regulations which necessitate a record of transactions with foreign countries.

The Chief of the Bureau of Statistics, in his first annual report on the internal commerce of the United States, published in 1877, estimated its value to be twenty-five times that of our total foreign commerce. His reasons for the estimate were as follows:

"The relative importance of internal and of foreign commerce may be inferred from the following comparative statements:

Estimated value of shipping (American and foreign) employed in our foreign trade	$200,000,000
Estimated value of the railroads of the United States	4,600,000,000

"The value of the commodities embraced in our foreign commerce and the estimated value of commodities transported on railroads are as follows:

Value of imports and exports (foreign commerce)	$1,121,634,277
Estimated value of commodities transported on rail (internal commerce)	18,000,000,000

"It appears from these estimates that the value of the railroads of the country is about twenty-three times the value of the shipping engaged in our foreign trade, and that the value of our internal commerce on railroads is about sixteen times the value of our foreign commerce.

"It is to be observed that these comparative statements embrace the value of our entire foreign commerce, whereas the data in regard to internal commerce relate only to railroads.

"If it were possible to ascertain the value of the commerce between the different sections of the country, on the ocean and gulf, and on the lakes, rivers, and other avenues of transportation, we should probably find that the total value of our internal commerce is at least twenty-five times greater than the value of our foreign commerce."

If we accept this estimate as correct, we must multiply the present foreign commerce of the United States (which during the fiscal year ending June 30, 1886, was $1,314,960,966 in value) by twenty-five to reach the present total of our internal commerce. The result is the enormous sum of $32,874,024,150, or more than double the value of the foreign commerce of the whole world.

The question now arises, What portion of this internal trade belongs to the twenty-one States and Territories tapped by the navigable portions of the Mississippi and tributaries? In view of the facts and figures above given in regard to their percentage of staple products it is doubtless fair to assume that their internal trade is at least half that of the United States. The logical conclusion, then, from the above premises is that the internal commerce of the twenty-one States and Territories is upward of $16,000,000,000 in value, or greater than the foreign commerce of all nations combined.

But suppose this estimate by the Chief of the Bureau is too high (as a discussion of the subject in a subsequent report seems to indicate), and that it be reduced one-half, even then the internal commerce of the twenty-one States and Territories would be as great as the foreign commerce of Great Britain, France, and Germany combined.

HOW TRANSPORTED.

In former days, before the era of railways, the products of the valley were carried almost entirely by river. It was also the principal passenger line. The small boats of the early Spanish and French explorers floated upon its waters. The early emigration from the East to the West relied upon the waters of the Ohio. The trading posts of the valley were established upon the banks of the various navigable streams, and with the growth of the towns, villages, and cities the traffic upon the Mississippi and tributaries grew to large proportions. But how is it to-day?

Perhaps no fairer illustration can be found than the receipts and shipments of freight of Saint Louis, situated, as it is, in the center of this great river system.

During the past ten years the total receipts and shipments of this commercial center were, in tons, as follows:

Year.	By river.	By rail.
	Tons.	*Tons.*
1877	1,242,155	5,137,238
1878	1,329,375	5,655,866
1879	1,366,115	6,948,794
1880	1,931,385	8,852,204
1881	1,736,435	10,213,487
1882	1,571,985	10,649,782
1883	1,306,565	10,408,939
1884	1,035,260	10,052,206
1885	1,013,240	10,301,301
1886	1,132,100	10,728,110
Total	13,664,615	88,957,927

In brief, ten years ago 19.4 per cent. of the annual freights of Saint Louis were transported by river and 80.6 per cent. by rail; but during the last year only 9½ per cent. were transported by river.

INCREASING DEMAND FOR TRANSPORTATION.

The importance of keeping the inland water lines in good repair may be seen from the past demand of the valley for transportation routes to the seaboard, but still more clearly from an examination of its probable future growth and development. In business matters we can safely judge the future by the past. What material progress, then, do we find, and what may we expect in the future?

The statistics of corn grown in the twenty-one States and Territories intersected by the Mississippi and tributaries during the years 1860 and 1885 were as follows:

	Bushels.
1860	651, 514, 436
1885	1, 729, 924, 000

This was an increase of 165 per cent. in twenty-five years.

The growing demand for transportation facilities may be further illustrated by reference to the statistics of improved lands at the time of the census of 1870 and 1880.

State.	Total area.	Improved land, 1870.	Improved land, 1880.
	Acres.	*Acres.*	*Acres.*
Arkansas	33, 406, 720	1, 859, 821	3, 595, 603
Illinois	35, 462, 400	19, 329, 952	26, 215, 154
Indiana	21, 637, 760	10, 104, 279	13, 933, 738
Iowa	35, 228, 800	9, 396, 467	19, 866, 541
Kansas	52, 043, 520	1, 971, 003	10, 739, 566
Kentucky	24, 115, 200	8, 103, 850	10, 731, 682
Louisiana	26, 461, 440	2, 045, 640	2, 739, 972
Minnesota	53, 459, 840	2, 322, 102	7, 246, 693
Mississippi	30, 179, 840	4, 209 146	5, 216, 937
Missouri	41, 824, 000	9, 130, 615	16, 745, 031
Nebraska	48, 636, 800	647, 031	5, 504, 702
Ohio	25, 576, 960	14, 469, 133	18, 081, 091
Tennessee	29, 184, 000	6, 843, 278	8, 496, 556
Wisconsin	34, 511, 360	5, 899, 343	9, 162, 528
Dakota	96, 596, 480	42, 645	1, 150, 413
Indian Territory	44, 154, 240	.....	.....
Total	632, 479, 360	96, 374, 305	159, 326, 208

The contrast shows that in 1870 only 15 per cent. of the area of these great and productive States and Territories was then improved, and that 85 per cent. remained for development, and that in 1880 but 25 per cent., or one-fourth part, was improved.

The coal-fields of the Valley States furnish still more striking evidence to the same effect. Their product and its increase in fifteen years were as follows:

	Tons.
1870	6, 793, 098
1885	32, 118, 208
Increase	25, 325, 110

Or more than 370 per cent.

That increase is trifling compared with what we may expect in the near future, for the coal deposits of these States are the most extensive that exist in the whole country, yet the least developed.

These facts and figures clearly indicate that we may expect a regularly increasing demand for cheap, convenient, and untrammeled transportation from the valley to the seaboard until its fertile fields are adequately populated and developed.

Unless this reasonable demand is supplied by a thorough and comprehensive improvement of the channels of the Mississippi and its confluents, the natural development of the great interior States will fall far short of their possibilities, and the consumers of the East, as well as the producers of the West, will suffer from the neglect.

VI.—ALLUVIAL LANDS.

AREA AND PRESENT CONDITION.

The area of the alluvial lands along the Lower Mississippi and tributaries is 41,193 square miles, being as large as the combined areas of New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, and New Jersey. It is three-fourths the extent of England, which contains 52,922 square miles, and more than eighteen times larger than Holland, which is a rich country formed by the protection of alluvial lands along certain rivers and the Zuyder Zee. This area of the Mississippi Delta, reduced to acres, is 26,363,520. According to those most familiar with the subject, and who are competent judges, all but 10 per cent. of these lands are susceptible of cultivation and of unsurpassed fertility. We have, then, 23,727,168 acres to be protected, their increased values to be added to the general wealth and their products to help swell the sum total of the national industries.

What is their present condition? We find that in 1870 but 1,969,238 acres, or less than 8 per cent. of their area, was under cultivation.

Why are these rich and productive lands thus neglected? Chiefly, if not solely, because of the periodical destruction of crops, buildings, and danger to health and even life from the overflow of the river.

PRESENT VALUE.

The value of the above 1,969,238 acres, improved in 1870, was, according to an estimate by the Chief of Engineers, U. S. Army, $80,431,221, or $40.84 per acre. The remaining 21,757,930 acres which are unimproved, but susceptible of cultivation, had but trifling values, say from 10 cents to $2 per acre. Mr. Ellis said, in his report to the House of Representatives in 1876: "Millions of acres have been sold for taxes; others, after advertisement, have failed to bring anything whatever." It is believed $1.25 was in 1876 a fair estimate of the value per acre of those unimproved lands. We reach, then, the following conclusion, supposing the values and areas cultivated have not materially changed:

Value of improved lands	$80, 431, 221
Value of unimproved lands	27, 197, 612
Total value	107, 628, 833

FUTURE VALUE IF PROTECTED.

Now let us consider their possibilities. The totals resulting are so large that only by comparison can we appreciate the fairness of the estimate.

Probably no one will dispute the assertion that the Delta of the Mississippi is as productive as the Delta of the Rhine in the Netherlands, and if the statistics of the value of the protected lands in Holland and other provinces of the Netherlands were accessible, it would be an interesting and fair comparison, because of the similarity existing between these countries. But as they are not within reach, we will take for a comparison the farm lands of New Jersey. We select that State, because its farm lands have a very high value per acre, and for the further reason that no lands in this country are too fertile and valuable to be contrasted with the possibilities of the Mississippi Delta.

According to the United States census of 1880 the average value per acre of the 2,096,297 acres of improved lands in New Jersey, including farms, fences, and buildings, was $91 per acre.

The alluvial lands of the Mississippi, if protected and improved, would, at that rate per acre, be worth $2,399,080,320. As their present value is but $107,628,833, the increase would be more than $2,000,000,000.

PRODUCTIVE CAPACITY.

It certainly is not an over-estimate of the productive capacity of the alluvial lands to say they will yield on an average as much as the farm lands of New Jersey. Such a comparison doubtless underestimates their capacity. The value per acre of the products of the improved lands of said State was, in 1880, $14.14. At that yield per acre the alluvial lands would annually produce to the value of $372,780,172. This is a moderate estimate, as may be seen from the following calculation, made from a different basis: According to the official report, for 1877, of the United States Commissioner of Agriculture, it takes, in the cotton-producing States of this country, an average of 2.63 acres to produce one bale of cotton. No one familiar with the alluvial lands will dispute their

wonderful capacity for cotton-growing. At the same rate, 2.63 acres to the bale, the total area would produce 9,021,736 bales. Reducing that to pounds, at 440 pounds to the bale, we have a total of 3,969,563,840 pounds. At 11 cents per pound the total value of their annual crop would be $436,652,022. It is evidently nearer the truth to say that the overflowed lands, if protected and cultivated as carefully as the farm lands of New Jersey, would produce on an average at least one bale to every acre. It is an assertion which any planter familiar with the wonderful fertility, depth, and inexhaustibility of the alluvial soil will readily indorse. At that rate the Delta of the Mississippi would produce each year 23,727,168 bales, worth at 440 pounds to the bale, and at 11 cents per pound, $1,148,394,931.

CONTRASTS WITH THE NETHERLANDS.

The history of the protection and development of the Netherlands (low countries) an exact parallel in formation to the alluvial lands of the Mississippi Valley, proves very clearly that we have not over-estimated the importance of the subject.

The United Kingdom of the Netherlands contains but 12,680 square miles, and North and South Holland, two of the eleven subdivisions of the same, but 2,209 square miles. The whole of the Netherlands is made-land having been formed by protection from the overflow of the lower Rhine, the Maas, the Scheldt and other rivers, 90 lakes, and the Zuyder Zee. The total cost of their protection by dikes, embankments, and other works was $1,500,000,000. The annual cost of guarding, protecting, and repairing is stated to be from $2,000,000 to $2,500,000. Probably that country, in proportion to its population, is the wealthiest nation upon the face of the earth.

An elaborate review of the same says: "The country is everywhere well peopled, and no population in the world exhibits a more uniform appearance of wealth, comfort, and contentment."

Holland not only has capital enough for home use, but the Dutch of Amsterdam are capitalists who have a large surplus to lend for public improvements and large enterprises in other nations. Yet all the wealth of this rich and commercially powerful kingdom was accumulated in an alluvial country having an area less than one-third that of the alluvial lands along the Lower Mississippi.

We will profit by their example if we protect our own lands from overflow—lands which are equally productive and far more easily and cheaply protected. The Dutch are, as a nation, economical and conservative. We, who claim to be progressive, should display equal enterprise in adding to the sum total of our national wealth, particularly when it can be done incidentally to a more important work—the improvement of navigation.

THE QUESTION OF PROTECTION.

If incidentally to the improvement of navigation the rich alluvial lands of the Lower Mississippi Valley should be protected from destructive floods, and almost fabulous additions made to the taxable wealth of the country, millions of citizens would be benefited, and none injured. But before stating the facts and figures it may be well to notice some of the popular misunderstandings of this important subject.

The Mississippi River Commission, who now have in charge the work of improvement, have, repeatedly, since their appointment, been termed by the press the "Levee Commission," thereby conveying to the mind of the public the erroneous impression that their chief duty was to serve the interest of one section of the valley, and build levees. What are the facts? The act creating the Commission is entitled, "An act to provide for the appointment of a 'Mississippi River Commission,' for the improvement of said river from the head of the passes, near its mouth, to its head-waters," which head-waters are in the State of Minnesota, near the northern boundary of the United States. Section 4 of the act prescribes their duty as follows: "It shall be the duty of said Commission to take into consideration and mature such plan or plans, as will correct, permanently locate and deepen the channel, and protect the banks of the Mississippi River; improve and give safety and ease to the navigation thereof; prevent destructive floods; promote and facilitate commerce, trade, and the postal-service."

"The Commission shall report in full upon the practicability, feasibility, and probable cost of the various plans known as the jetty system, the levee system, and the outlet system, as well as upon such others as they deem necessary." This correction is important, for such misapprehension tends to throw discredit upon a great national work.

Another source of misunderstanding and opposition has been the unnecessary use of the word "reclamation" in many bills which have in the past been introduced in Congress upon the subject of river improvement. That word was not used in the act creating the Commission, nor is it one of their duties to do farming for individuals at Government expense. An emphatic disclaimer of such a purpose was made in the House of

Representatives by the chairman of the Committee on the Mississippi, Hon. E. W. Robertson, in a speech advocating the appointment of a commission. He said of the bill then pending: "It contemplates the improvement of the chief avenue of transportation of a great commercial nation. It also seeks to protect from floods and pestilence over 26,000,000 acres of the most fertile and productive lands upon the face of the earth. It does not, as is so often alleged, aim at the reclamation of those lands, or seek to perform work which properly belongs to the individual citizen. The word "reclamation" is not used in the bill. It is well that we understand the distinction at the outset of this discussion, for the wrong use and confusion of terms have given the opponents of river improvement an opportunity to misinterpret, and therefore misrepresent, the object we seek to accomplish. The word 'reclamation' has furnished them with the keynote of unjust criticism. We simply ask protection from the frequent ravages of this great river, over which no power but the General Government has legal control, in order that we who possess lands along its course may have an opportunity to reclaim and cultivate them at our own expense."

In another speech in the House of Representatives, May 18, 1882, on the subject of the "protection of the valley," he was still more explicit, and stated the case with great force, as follows:

"In brief, we ask the protection not simply of alluvial lands, but agriculture in a broad and national sense; not only agriculture, but manufactures, commerce, the postal service, and the people themselves of the lower valley, an alluvial area embracing 41,000 square miles or nearly as large as all New England—three times the area of the celebrated valley of the Nile, formerly the granary of the oriental world—and eighteen the size of Holland—a magnificent empire in its extent and resources.

"From what do we ask protection? From the overflows of a great national sewer, filled with the drainage of the twenty-eight States and Territories; from the overflow of a great national highway of commerce, the trunk line of forty-two navigable tributaries, which supply water transportation to twenty-two States and Territories; from the overflow of a Government postal-route, a river subject to the admiralty and maritime jurisdiction of the United States; from an enemy in whose clutches a single State is as powerless as a little child in the deadly clasp of the octopus; from a river which in itself and in its relations to the nation is exceptional."

VII.—DESTRUCTIVE FLOODS.

The destructive floods of the Mississippi Valley not only sweep over the alluvial lands of the lower valley between Cairo and the Gulf, but frequently occur in the valleys of the upper Mississippi, the Missouri, Ohio, Red, Arkansas, Tennessee, Cumberland, Yazoo, and other rivers of this comprehensive system, carrying with them enormous destruction to crops, roads, railroads, postal-routes, buildings, live-stock, commerce, and industries. They are often attended with the loss of life itself.

Mr. Morey, in his report to the House of Representatives during the Forty-second Congress, said of the floods of 1868 and 1871: "The destruction caused by the last two floods above named in the Ouachita valley is almost incredible. A valley of almost unexampled fertility, capable of raising, beside corn and stock in great abundance, at least 75,000 bales of cotton, worth, at the average price of this season, more than $5,000,000, was inundated, plantations destroyed, buildings washed away, cattle and swine by the thousand starved or drowned," etc.

Another flood in 1874 was still more destructive. Mr. Ellis, in his report to the House, in 1876, says of it: "The loss by the flood of 1874 was $13,000,000. This year, so far as it can be ascertained, it is $2,000,000. And this makes the total sum $15,000,000 in actual material wealth within three years."

The great flood throughout the length and breadth of the Mississippi Valley in the spring of 1881 was unusually destructive, the damage amounting to many millions of dollars. As it is impossible to give an accurate estimate of the total damage, we will give a few illustrations by extracts from the press dispatches published in leading daily papers of that time.

"*Omaha, April* 25.—The flood still continues. The river rose 2 inches last night at this point, but it has done no further damage to manufacturing interests on the water front. Much lumber in the yards has been removed to higher ground. The Union Pacific shops and smelting works, Boyd's packing house and distillery are still under water, and 1,600 men are out of employment.

"At Council Bluffs one-half of the city is under water, and 600 people are homeless All passengers from eastern trains are transferred by boat to the Union Pacific depot.

"A dispatch from Sioux City announces a fall of 6 inches at that point.

"This morning high winds set in from the north and stirred up the vast body of water north of the long embankment leading up to the Union Pacific bridge on the east side,

and the high waves dashing against it soon washed out the dirt close up to the ties. This was discovered just in time to prevent an accident, and a large force of men were put to work piling sand bags along the north side, thus breaking the force of the waves and saving the embankment. Two hours more and the water would have taken out a section of several hundred feet of the approach to the bridge. The transfer of passengers, baggage, and mails is continued by boat at Council Bluffs. There is no material change in affairs here since yesterday. The Union Pacific road is running regular trains.

"The village of Waterloo, near Elkhorn River, 25 miles west of Omaha, is flooded to a depth of 5 feet.

"The overflow which covers the country for many miles is doing considerable damage to farms in Elkhorn Valley.

"Some citizens of Waterloo claimed their town was flooded owing to the Union Pacific Railroad embankment holding the water back, and they threatened to open a channel through it, but were prevented by the timely appearance of a sheriff and posse of constables from Omaha. Six ice-houses, located in Omaha Bottoms, have been wrecked by high water and rendered a total loss. A large wagon-bridge came down the river to-day, landing on the east side of the smelting works.

"*Hannibal, Mo., April* 25.—The Sny levee broke at 3 o'clock this morning, at a point about a mile and a half above East Hannibal. The crevasse is 130 feet wide, and the water is still cutting both below and above the break. Near East Hannibal there are several weak points liable to go at any moment. The river is 19 feet and 1 inch above low-water mark, and is still rising, but very slowly.

"Trains from Quincy to Hannibal, via the Chicago, Burlington and Quincy Railroad, are abandoned, the track between Fall Creek and East Hannibal inside the levee being under water. It is estimated that 30,000 acres of fall wheat had been sown inside the levee, all of which is now a total loss. There are nearer 10,000 acres, the yield of which heretofore had averaged 30 bushels to the acre. This season it stood finer than ever. The loss on wheat alone is placed at $1,000,000. The river is still slowly rising, and has now nearly reached the highest point of last year.

"*Saint Louis, April* 25.—The river is rising and rapidly approaching the danger line. A rise of another foot and the water will submerge some of the low lands in the northern part of the city, and inundate part of the bottoms on the Illinois side of the river. Much apprehension is felt for property on both sides of the river, and measures are being taken to protect it. Old steam-boat men are predicting a flood of unusual magnitude, and say that if the present warm weather continues, and particularly if there is much rainfall in the north, a freshet equal to that of 1844 will probably follow.

"*Bismarck, April* 25.—One mile of track and thirty pile bridges washed away constitute the extent of damages on the Northern Pacific extension. Night and day forces are at work repairing, and trains to the end of the track are promised in a few days.

"*Kansas City, April* 25.—The levee which was built to protect the town of Harlem and the broad bottom lands opposite the city from overflowing gave way on Saturday night, and a strong current, 10 feet deep, is now running at the rate of 5 or 6 miles an hour over the tracks of the Hannibal and Saint Joseph, Council Bluffs, Chicago, Rock Island and Pacific, and Wabash roads. For nearly a mile all these tracks are supposed to be washed out. The levee gave way about 10 o'clock at night. The water is overflowing a large number of farms to the depth of from 4 to 6 feet.

"*Saint Paul, Minn., April* 25.—A special from Fergus Falls says the upper country is an unbroken sheet of water, beginning at a point about 25 miles below Saint Vincent and extending this way to the vicinity of Crookston. Twenty-five miles south of Stevenson the water has swept away the track of the Saint Paul, Minneapolis and Manitoba Railroad, and all railroad travel is suspended.

"*Saint Paul, Minn., April* 27.—The flood at Saint Paul, caused by the coming down of high water in the Minnesota River, continues. The water has now reached 18 feet in the channel—3 feet higher than during the June rise of last year, and the highest point reached since the great flood of 1867. There is to-day scarcely a foot of uncovered land in the entire country west of Saint Paul, flat lands, over which the waters are not now running riot. Old residents there affirm that although they have frequently seen the water cover the lowlands, they have never known the current so strong as to sweep over them with such overwhelming velocity as it is doing to-day. The current carried away the bank on which Fifth street is built this morning, and there is only a single road remaining uncovered between river and bluff. A visit to the scene to-day found hundreds of houses isolated by water and the occupants busy moving. The sides of the raised embankment were filled in many places with all manner of household effects, which had been brought in boats from the inundated residences, and around which were the owners watching and guarding the same while awaiting the arrival of vehicles to transport the goods to some place of safety.

"*Omaha, Nebr., April* 27.—The river has fallen 10 inches here. A further fall of 18 inches is reported at Sioux City. Information having been received at Nebraska City that many people living on the river north of that city were in great peril, one of the ferry-boats started out yesterday and rescued nearly 200 men, women, and children, some of whom had been without food two or three days, and were suffering extremely from hunger. These people were lodged in the opera house, the city hall, churches, and other public buildings. * * *

"East Nebraska, on the Iowa side of the river, is entirely flooded, and all the inhabitants have been compelled to abandon their homes and seek refuge in Nebraska City proper. Thousands of people along the river bottoms in Nebraska, Missouri, Iowa, and Kansas are homeless and destitute. Passengers, mail, and baggage trains arrived here same as the last few days, only did it more rapidly than heretofore. It will be at least one week before the railroads get into the same shape as before the flood.

"*Saint Joseph, Mo., April* 27.—The river at this point is 22 feet 6 inches above low-water mark and rising slowly. Many families have been rescued from their inundated houses in the bottom lands during the day, generally in destitute circumstances. All the available flat-boats have been in use removing people and stock. An old man and his wife, 76 to 80 years of age, were to-day rescued from the Elmwood bottom, where they were living in a small one-story house, having been two or three days surrounded by the swift current, a mile from land, and the water 2 feet deep in the house. * * *

"*Atchison, Kans., April* 27.—Contrary to expectations, the river has continued to rise steadily during the past twenty-four hours, and is now 22 feet 4 inches above low-water mark, and at least 20 inches above the level of the great flood of 1844. The Missouri Pacific road continues to afford the only connection with the East, and it has to send its passengers and mails around by way of Topeka.

"*Chicago, April* 20.—The total loss of property by the flood on the Missouri River and its tributaries between Sioux City and Bismarck is estimated at $2,500,000. Below Sioux City, including the damage done at Omaha, Council Bluffs, Kansas City, and the great overflow on both sides of the Missouri between these cities and Saint Louis, the amount of loss is computed at $1,500,000."

DEBATE IN UNITED STATES SENATE ON FLOOD OF 1882.

"In the spring of 1882 another destructive flood spread over the Lower Mississippi Valley. Its damage in the States of Mississippi and Arkansas was described in the following debate in the United States Senate, February 23, 1882:

"Mr. GEORGE. Mr. President, I should like to be indulged in making a remark or two explanatory of the magnitude of the disaster referred to in the joint resolution.

"The district overflowed from the breaking of the levee embraces all the Mississippi Delta between Memphis and Vicksburg, about 15 miles in length and about 40 miles in breadth. All of it is either now under water or will be in a short time. I desire also to state, for the information of the Senate, that four-fifths of the population which inhabit that district is composed of colored laborers, who have not the means of support during the time when this overflow will necessarily interrupt labor.

"Mr. INGALLS. What is the estimated number of laborers who have been rendered destitute by this inundation?

"Mr. GEORGE. They inhabit a district about 150 miles long by about 40 wide. I suppose there must be from 50,000 to 75,000 inhabitants in that district.

"Mr. TELLER. What proportion of them will be rendered destitute?

"Mr. GEORGE. Four-fifths. I desire also to state for the information of Senators who are not familiar with the length or duration of on overflow in the Mississippi bottoms, that it is not an affair of a day or a week. The overflows in that section of the Mississippi bottoms generally continue from four to six weeks before there is a subsidence of the waters; and during all that time there is a total suspension of all labor; the water gets all over the whole country.

"I have confined my statement to the destitution in Mississippi. There are contiguous districts on the western bank of the Mississippi River, in the State of Arkansas, that suffer from the same overflow. The Senator from Arkansas [Mr. Garland] will make a statement upon that subject.

"I shall ask to have the joint resolution referred to the Committee on the Improvement of the Mississippi River and its Tributaries, in the hope that that committee may act upon it with promptness, as the matter will not admit of delay.

"Mr. GARLAND. The information that the Senator from Mississippi gives in reference to his own State applies exactly to the State of Arkansas, which is in front of the overflowed Mississippi River. The intelligence that I receive from that portion of the State of Arkansas through telegrams, letters, and newspapers, represents the destruction there as widespread, and as absolutely appalling and unprecedented. The overflow has taken barns and granaries, and has swept away the last stock the farmers and planters of that country owned and had to live upon.

"I am not prepared in my own mind to say just exactly what relief, or what measure of relief, Congress can or should afford, but certainly there is now a just demand for relief, if it is in the power of Congress to grant it. I hope the joint resolution will be referred to the committee indicated by the Senator from Mississippi, and that that committee may see proper to give it early consideration and report some measure for the relief of those suffering people.

"Mr. HAMPTON. I just came into the Senate when the joint resolution was sent to the Clerk's desk and read, and as I am very familiar with that section of country, having been there a great deal, I wish to make a statement in regard to it.

"The area of land which will be overflowed if the river rises as high as it has done formerly will cover the richest portion of the Mississippi Valley on the Arkansas side and on the Mississippi side. I am more familiar with it on the Mississippi side than on the Arkansas side; but it will cover the most productive and finest cotton-growing territory in the whole State. I have known the river to be at that point sometimes nearly 150 miles wide, for it covers from the Yazoo hills on the one side to the Arkansas bluffs on the other, and in that whole section of country if the river is as high as these dispatches say it is there will hardly be any land at all above overflow. There are only a few spots in that great Mississippi bottom which are above overflow, and the destruction not only of stock, but of the incoming crop will be so great that I have no hesitation in saying the dispatches from the governor of Mississippi give but a faint idea of the destitution and starvation that will follow there.

"My friend from Mississippi thinks that there are 75,000 people in this area covered. I think he has underestimated the number very much.

"Mr. GEORGE. I spoke of the Mississippi side.

"Mr. HAMPTON. On the Mississippi side I think the numbers would be very much larger than that. Nearly the whole of those people are colored people; they rent the land and the loss will fall upon them. They have made no provisions at all for immediate sustenance, and unless some aid can be given promptly, I have no question that there will be starvation and infinite suffering in that whole country."

In the spring of 1883 an unusually destructive flood in the Ohio River Valley submerged a large portion of the city of Cincinnati, which was very forcibly described in the following dispatch from Murat Halstead, February 16, 1883:

"The loss of life has not been very great, but the destruction of household property is enormous, and clothing, sheltering, and feeding the poor who have fled from their homes will strain all resources. The care of property in the submerged district is a great task, and our military companies are out at night patrolling the streets. The schoolhouses are crowded with fugitives. The coal supply of the city is under water. The water-works are overwhelmed. The gas-works are submerged. Our condition is in many respects critical, but nothing but a sudden and immense rainfall beyond all example can prevent our relief by the fall of the river. There are remarkable coincidences between this monstrous rise in the Ohio and the December overflows of the Rhine and Danube. The parallel between the Rhine especially and the Ohio in the origin, progress, extent, and duration of the floods is very striking, and the correspondence in the two cases may be traced also in the intelligent compassion and remarkable liberality with which the sufferings of those made homeless, whether on the Rhine or the Ohio, were regarded and relieved by the enlightened and the benevolent."

The above are but illustrations of the frequent and wholesale destruction and desolation caused by the floods throughout the length and breadth of the great valley. But they are sufficient to show that these floods pay no attention to State lines and that they are national in extent and magnitude.

VIII.—NATIONAL FEATURES.

NATIONAL IN EXTENT.

A river system in which twenty-one States and Territories have a direct business interest, and nearly all others an indirect interest—which intersects the great productive center of the continent, and by means of cheap transportation brings the producer and consumer into easy communication—which supplies a connecting-link between internal and international commerce, is something more than sectional—it is emphatically national. The navigable portions alone of the Mississippi and tributaries are distributed among the States substantially as follows:

	Miles.		Miles.
Arkansas	2,375	Indian Territory	720
Missouri	1,950	Minnesota	660
Louisiana	1,925	Ohio	550
Mississippi	1,380	Wisconsin	520
Montana	1,310	Texas	440
Dakota	1,280	Nebraska	400
Illinois	1,270	West Virginia	390
Tennessee	1,260	Pennsylvania	250
Kentucky	1,230	Kansas	240
Indiana	840	Alabama	200
Iowa	830		

They also supply facilities for inland inter-communication by water between the following cities:

Saint Paul, Minn.
Pittsburgh, Pa.
Cincinnati, Ohio.
Louisville, Ky.
Omaha, Nebr.
Peoria, Ill.
Vicksburg, Miss.
La Crosse, Wis.
Wheeling, W. Va.
Nashville, Tenn.
Little Rock, Ark.
Decatur, Ala.
Cairo, Ill.
New Orleans, La.
Saint Louis, Mo.
Kansas City, Mo.
Keokuk, Iowa.
Knoxville, Tenn.
Memphis, Tenn.
Minneapolis, Minn.
Shreveport, La.
Sioux City, Iowa.
Quincy, Ill.
Parkersburgh, W. Va.
Dubuque, Iowa.
Jefferson City, Mo.

There are several hundred other cities and important commercial towns scattered, as they are, over different sections of a great and broad country.

If to these rivers we add the existing supplements, we find that they supply facilities for inland water inter-communication between twenty-five States and Territories.

Adding the projected or proposed supplements above described, they will supply the facilities for twenty-nine States and Territories.

And adding to the above other States and Territories which rest upon the Pacific and Atlantic Oceans, we find that the Mississippi and tributaries, with existing and proposed supplements, and the oceans on the east and west, will permit water inter-communication between forty-one States and Territories, or all but five of the total forty-six States and Territories of the entire Union.

NATIONAL IN LAW.

This river system is also national in law. The doctrine, as declared by the Supreme Court of the United States, in the case of the *Daniel Ball*, 10 Wallace, 557, is as follows:

"Those rivers must be regarded as public navigable rivers in law which are navigable in fact. And they are navigable in fact when they are used, or are susceptible of being used, in their ordinary condition, as highways for commerce, over which trade and travel are, or may be, conducted in the customary modes of trade and travel on water. And they constitute navigable waters of the United States, within the meaning of the acts of Congress, in contradistinction from the navigable waters of the States, when they form in their ordinary condition, by themselves, or by uniting with other waters, a continued highway, over which commerce is, or may be, carried on with other States or foreign countries in the customary modes in which such commerce is conducted by water."

NATIONAL IN BENEFITS.

In its benefits, also, this net-work of water ways is national. The consumer of the East and the producer of the West have a common interest in cheap transportation and cheap food. The recognition of this principle on the floor of the United States Senate should be considered by every one who, through wrong information, superficial observation, or sectional feeling, imagines that the improvement of the Mississippi River is a local movement. We refer to the tribute by Senator Bayard, who said in June, 1880, in speaking of the improvements already made at the mouth of the river: "The results of such a work, if maintained according to present promise and to all reasonable hope, are magnificent and incalculable in their benefit, not simply to a State but to the entire Union, and not simply to the entire Union, but you may say the benefits are world-wide. It is making food cheaper for this world that the Mississippi River can perform its great carrying functions to bring the vast crops of products of the wheat lands, and the granary of this country and of the world, into the use of mankind in general."

NATIONAL IN DAMAGE.

As shown in a previous chapter the periodical floods of the valley are national in the extent and magnitude of their destruction. They are also beyond the jurisdiction and control of individual States, as was very clearly stated in the following extracts from a speech on this subject by Hon. E. W. Robertson, of Louisiana, in the House of Representatives May 18, 1882: "On the west bank of the Mississippi there was built a continuous line of levee extending from Louisiana into Arkansas. For about fifteen years past the levee has been broken for several miles above and below the boundary line dividing the two States. Arkansas, for some reason, is indifferent to repairs at this particular place. The result is that the floods which sweep through the gap in Arkansas continue down through Louisiana in the rear of her system of levees, thereby nullifying all the efforts of the latter State to secure protection. Does any one contend that Louisiana has jurisdiction over Arkansas? The two States can not even make a binding agreement on the subject of protection, for the Constitution expressly denies their right to enter into treaties between themselves. It is, then, worse than idle to tell us of the lower valley to protect ourselves. * * * Can States combine to accomplish this protection, 'to provide for the common defense and general welfare?' Not at all, for they are expressly prohibited by section 10 of the same article, which says: 'No State shall enter into any treaty, alliance, or confederation.'

"How, then, can the States of the lower valley agree upon a uniform plan of protection from their common enemy, the great and national Mississippi in flood-time? They can not. They are powerless. They are helpless, and subject to the mercy of the floods.

"They invoke, then, the aid of that Federal power whose fundamental object is the protection of its own citizens and its own States."

NATIONAL IN POLITICS.

The political features of the Mississippi and tributaries are also national. If to the Representatives of the people in Congress from the sixteen Valley States and Territories were added those from Pennsylvania, West Virginia, Alabama, and Texas, which States are intersected by, and have an extensive business interest in, the navigable waters of these rivers, the result would show a very large majority in the House of Representatives. But it is unnecessary to urge this point, for all sections have a common interest in the great water ways which intersect the granary of a common country. Instead of being an element of strife and sectional antagonism, the Mississippi is a bond of union. In this respect nature has accomplished for the people of the great interior what President Washington was so anxious to see accomplished for a similar purpose in another direction by artificial and costly means. We refer to his favorite project of uniting, by a canal, the Potomac River and a tributary of the Ohio, so as to bind, in commercial and political ties, the Mississippi Valley to the Atlantic States. To create a similar bond of union between the Pacific States and the rest of the country, Congress, at the close of the late civil war, granted to the Union and Central Pacific Railway Companies 20,000,000 acres of public lands, and loaned $53,121,632 in bonds.

Nature has, without cost, bound together the many States of the North and South, and of the great interior, in a perfect net-work of commercial ties.

The problem of new and enlarged commercial intercourse and fellowship between the two sections is not a difficult one, if we look to the Mississippi for a solution. This was demonstrated a few years ago by the enthusiastic response from both sides of the House of Representatives to the remarks by General Garfield, closing the debate on the Mississippi River Commission bill, with the following liberal sentiment:

"I rejoice in any occasion which enables Representatives from the North and from the South to unite in an unpartisan effort to promote a great national interest. [Applause.] Such an occasion is good for us both. And when we can do it without the sacrifice of our convictions and can benefit millions of our fellow-citizens, and can thereby strengthen the bonds of the Union, we ought to do it with rejoicing; for in doing so we inspire our people with larger and more generous views, and help to confirm for them and for our children to our latest generations the indissoluble Union and the permanent grandeur of this Republic. I shall vote for this bill." [Applause on both sides of the House.]

OPINIONS OF NATIONAL STATESMEN.

John C. Calhoun, the strictest of strict constructionists, said of it, in 1845, in a speech delivered at Memphis: "The invention of Fulton has, in reality, for all practical purposes, converted the Mississippi with all its tributaries into an inland sea. Regarding it as such I am prepared to place it on the same footing with the Gulf and Atlantic coasts, the Chesapeake and Delaware Bays, and the Lakes in reference to the superintendence of the General Government over its navigation. It is manifest that it is far beyond the power of individual or separate States to supervise it."

Vice-President Hendricks, in a speech delivered in 1866, said:

"That river is under the control of the Government for almost every purpose. It is a great channel of commerce; it is the Nation's river; it does not belong to Louisiana; it does not belong to Mississippi; it is the river of all the States."

General Garfield, while in the House of Representatives, said, in support of the bill creating the Mississippi River Commission:

"I believe that one of the grandest of our material national interests, one that is national in the largest material sense of that word, is the Mississippi River and its navigable tributaries. It is the most gigantic single natural feature of our continent, far transcending the glory of the ancient Nile, or of any other river on the earth. The statesmanship of America must grapple the problem of this mighty stream. It is too vast for any State to handle; too much for any authority less than that of the nation itself to manage. And I believe the time will come when the liberal-minded statesmanship of this country will devise a wise and comprehensive system that will harness the powers of this great river to the material interests of America, so that not only all the people who live on its banks and the banks of its confluents, but all the citizens of the Republic, whether dwellers in the central valley or on the slope of either ocean will recognize the importance of preserving and perfecting this great natural and material bond of national union between the North and South, a bond to be so strengthened by commerce and intercourse that it can never be severed." [Applause.]

In his letter of July 10, 1880, accepting the nomination for the Presidency, General Garfield further said:

"The Mississippi River, with its great tributaries, is of such vital importance to so many millions of people that the safety of its navigation requires exceptional consideration. In order to secure to the nation the control of all its waters, President Jefferson negotiated the purchase of a vast territory extending from the Gulf of Mexico to the Pacific Ocean.

"The wisdom of Congress should be invoked to devise some plan by which the great river shall cease to be a terror to those who dwell upon its banks, and by which its shipping may safely carry the industrial products of twenty-five millions of people."

In his annual message to Congress in 1880 President Hayes said:

"A comprehensive improvement of the Mississippi and its tributaries is a matter of transcendent importance. These great water-ways comprise a system of inland transportation spread like net-work over a large portion of the United States, and navigable to the extent of many thousands of miles. Producers and consumers alike have a common interest in such unequaled facilities for cheap transportation. Geographically, commercially, and politically, they are the strongest tie between the various sections of the country. These channels of communication and interchange are the property of the nation. Its jurisdiction is paramount over their waters, and the plainest principles of public interest require their intelligent and careful supervision, with a view to their protection, improvement, and the enhancement of their usefulness."

President Cleveland, in a speech delivered at Memphis, Tenn., October 15, 1887, said:

"There flows past your city our nation's great river, which you rightly regard as a most important factor in your present and future welfare, and which I believe is universally recognized as a proper object of governmental protection and improvement. To Memphis and to every other city on its banks the improvement of this vast highway of commerce is so essential that they should be interested in having this and other proper work of the same description considered upon their merits, and freed from schemes sometimes questionable in their character and often extravagant in their demands."

AMERICAN COUNTRIES ON THE SOUTH.

Proposed Inter-Ocean Routes and Steamship Lines,

AND OUR

FOREIGN COMMERCE

OF THE

SECOND CENTURY.

IX.—INTERNATIONAL FEATURES.

AMERICAN COUNTRIES AT THE SOUTH.

The Lower Mississippi is the trunk line of the 16,090 miles of navigable water ways of this great river system. After intersecting or bordering twenty-one States and Territories of the great interior it converges and terminates at the Gulf of Mexico. Facing its mouth there are on the continent south of the United States fifteen Spanish-American Republics, the Portuguese-American Empire of Brazil, and four European colonies, which have a total population of 45,000,000 consumers, and an area of about 8,000,000 square miles, or more than double that of the United States.

Also, facing its mouth are the various West India Islands, with an area of about 100,000 square miles and a population of about 4,000,000 souls.

The names and ownership of the forty principal West India Island and the several countries on the continent are, in detail, as follows:

Spanish West Indies: Cuba, Porto Rico, and Isle of Pines.

British West Indies: Jamaica, Bahamas, Trinidad, Grenada, St. Vincent, St. Lucia, Antigua, Barbuda, St. Christopher, Caymans, Virgin Islands, Tobago, Grenadines, Barbadoes, Dominica, Montserrat, Nevis and Rodonda, and Anguilla.

French West Indies: Martinique, Desirade, Les Saintes, Guadeloupe, Curaçoa, and Buen Ayre.

Danish West Indies: St. Thomas, Santa Cruz, and St. John.

Swedish West Indies: St. Bartholomew.

Venezuelan West Indies: Marguerite, Les Siete Hermanos, and Tortuga.

Independent West Indies: Hayti and San Domingo.

Central American republics: Guatemala, San Salvador, Costa Rica, Honduras, and Nicaragua.

Central American colony: British Honduras.

Mexican Republic: Comprising twenty-seven States, one Territory, and a Federal District.

South American republics: United States of Colombia, Chili, Argentine Republic, Ecuador, Uruguay, Peru, Venezuela, Bolivia, and Paraguay.

South American Empire: Brazil.

South American colonies: British Guiana, French Guiana, and Dutch Guiana.

In view of this colossal showing one would naturally expect to find a large portion of the foreign commerce of the United States to be with the neighboring sister American nations.

What are the facts?

OUR FOREIGN COMMERCE OF THE FIRST CENTURY.

The foreign commerce of the United States during the first century of its existence was mainly with Europe. The course of trade at the end of one hundred years is as follows:

	Per cent.
Exports to Europe and adjacent countries, on the east	81
Exports to American countries, on the south	10
Exports to British America, on the north	5
Exports to Pacific countries, on the west	4

The one-sided nature of our commerce may be seen by a glance at the accompanying diagram illustrating the general course of steam-ship lines.

Our exports are also unsymmetrical in quality, 74 per cent. being the product of agriculture and only 15 per cent. the products of manufacture.

Of our total annual manufactures, which during the census year ending 1880 were $5,369,579,191 in value, but 2 per cent. find foreign markets. This is indeed an astonishing state of affairs, a defect in our commercial relations with the outside world which must be cured, a weak spot which must be built up and strengthened.

The annual foreign commerce of the various American countries south of the United States during the last attainable year were, according to a recent report by Secretary Frelinghuysen, in response to a Senate resolution of inquiry, as follows:

	Total imports.	Imports from United States.
Mexico	$42,579,000	$12,704,000
Central America	10,000,000	3,178,000
British Honduras	1,164,000	430,000
United States of Colombia	23,000,000	6,380,000
Venezuela	10,859,000	2,427,000
British Guiana	10,000,000	1,884,000
French Guiana	1,600,000	102,000
Dutch Guiana	1,400,000	320,000
Brazil	79,169,000	8,695,000
Uruguay	17,919,000	1,368,000
Argentine Republic	80,436,000	5,075,000
Chili	53,304,000	3,267,000
Bolivia	900,000	.....
Peru	12,000,000	1,071,000
Ecuador	6,000,000	629,000
Spanish West Indies	62,805,000	13,135,000
Hayti and San Domingo	7,724,000	4,054,000
Totals	420,859,000	64,090,000

In brief, we supply but 15 per cent. of the demand, or but about one-seventh part.

It is easy to understand why we control so insignificant a portion of this valuable trade when we examine the record of our exports to those countries from New Orleans, which port represents the principal Southern outlet of the Mississippi Valley. The value of exports of domestic merchandise from New Orleans to the various and neighboring American countries and islands on the south was, during the fiscal year ending June 30, 1886, as follows:

From New Orleans to—	Amount.	From New Orleans to—	Amount.
Argentine Republic	$7,215	Hayti	.....
Brazil	.....	Mexico	$562,572
Costa Rica	32,251	Dutch West Indies	.....
Guatemala	40,992	Dutch Guiana	.....
Honduras	150,127	Peru	.....
Nicaragua	63,841	San Domingo	.....
San Salvador	.....	Cuba	29,618
Chili	.....	Porto Rico	.....
Danish West Indies	.....	United States of Colombia	14,896
French West Indies	.....	Uruguay	.....
French Guiana	.....	Venezuela	.....
British West Indies	9,776		
British Guiana	.....	Total	1,063,660
British Honduras	152,372		

In other words the principal port on the southern coast of the United States is not doing its duty in supplying the Spanish and Portuguese American markets with our surplus products and manufactures. Nature has done everything to stimulate trade in this direction, but for some unaccountable reason it has been neglected by the United States.

Another astonishing defect in our foreign trade relations may be seen by reference to the total commerce of the various countries surrounding the Pacific Ocean and facing the west coast of the United States.

During a recent year their total annual imports and the share of the same supplied by the United States were as follows:

	Total imports from all nations.
Japan	$29,296,000
China	112,632,000
Hong-Kong	115,834,000
Philippine Islands	18,032,000
Dutch India	55,485,000
Siam	6,500,000
Straits Settlements	73,174,000
Australia, New Zealand, and Tasmania	118,600,000
Total	529,553,000

Of this total demand we supplied but $20,497,000 in value, or less than 4 per cent.

The above is the result of our foreign commerce during the first century of the Republic. What now is the outlook for the future?

OUR FOREIGN COMMERCE OF THE SECOND CENTURY.

A question of transcendant importance to the United States to-day is the development of new foreign markets for our surplus manufactures. It is useless to look to Europe for adequate outlets, for it is well supplied with manufactures of its own and has a surplus for export. We must rather look to the open, unsupplied, and inviting trade fields of Spanish and Portuguese America.

The question arises, how may these open and profitable fields be improved. Nature and common sense—the producer and consumer—demand that the neighboring Mississippi Valley, with its great water-ways, terminating at the Gulf, and with its surplus grain and provisions, take the lead in this new commercial movement. Direct and cheap transportation by way of the river and Gulf, in place of indirect shipments from the valley up and down the Alleghenies and then around and back again to the Indies, Mexico, and South and Central America, is the true solution of this commercial problem. New York is chiefly occupied with European trade, but the port at the mouth of the Mississippi has the time as well as favorable situation to make a success of American foreign commerce. It devolves upon her and the other trade centers of the valley to take the lead. The material interests of the entire country require it.

A few weeks before his assassination President Garfield said, in an address to the graduating class at Annapolis: "The Pacific is yet to be opened, and you gentlemen will be the ones to scout it for us." The significance of this remark will be appreciated by reference to the preceding trade statistics, and the diagram showing the Isthmian barrier which now stands in the pathway of direct water communication between the great Mississippi Valley and the Pacific.

The opening of the Isthmus of Tehuantepec will shorten the water route between the mouth of the Mississippi and Hong-Kong 10,502 miles each way, or 21,004 miles on the round voyage, for steamers between those two ports must now go around distant Cape Horn. In brief, the piercing of this isthmus for the transit of ships will place the Mississippi Valley in direct water communication with Australia, the countries of the Orient, and the west coast of Central and South America. Then we may expect our due share of that valuable foreign trade of which the United States now controls but about 4 per cent. and in which New Orleans has no participation.

The adequate development of these long-neglected foreign markets of the three Americas on the south and of the oriental countries on the west is the great material problem now awaiting solution.

These inviting trade fields constitute what may appropriately be termed our foreign commerce of the second century, and should, without further delay, be occupied with our surplus products and manufactures.

In his memorable tribute to America, in 1878, Gladstone said, in contrasting the commercial future of England and the United States:

"It is she alone who at a coming time can and probably will wrest from us that commercial primacy. We have no title; I have no inclination to murmur at the prospect. If she acquires it she will make the acquisition by the right of the strongest; but in this instance the strongest means the best. She will probably become what we are now, the head servant in the great household of the world, the employer of all employed, because her service will be the most and the ablest. We have no more title against her than Venice, or Genoa, or Holland has had against us."

There is no better way to facilitate the attainment of the "commercial primacy" here prophesied than by developing the international features of the Mississippi River and valley.

APPENDIX.

ACT CREATING THE COMMISSION.

AN ACT to provide for the appointment of a "Mississippi River Commission" for the improvement of said river from the head of the Passes, near its mouth, to its head waters.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That a commission is hereby created, to be called "The Mississippi River Commission," to consist of seven members.

SEC. 2. The President of the United States shall, by and with the advice and consent of the Senate, appoint seven commissioners, three of whom shall be selected from the En-

gineer Corps of the Army, one from the Coast and Geodetic Survey, and three from civil life, two of whom shall be civil engineers. And any vacancy which may occur in the commission shall in like manner be filled by the President of the United States; and he shall designate one of the commissioners appointed from the Engineer Corps of the Army to be president of the commission. The commissioners appointed from the Engineer Corps of the Army and the Coast and Geodetic Survey shall receive no other pay or compensation than is now allowed them by law, and the other three commissioners shall receive as pay and compensation for their services each the sum of $3,000 per annum, and the commissioners appointed under this act shall remain in office subject to removal by the President of the United States.

SEC. 3. It shall be the duty of said Commission to direct and complete such surveys of said river, between the Head of the Passes, near its mouth, to its headwaters as may now be in progress, and to make such additional surveys, examinations, and investigations, topographical, hydrographical, and hydrometrical, of said river and its tributaries, as may be deemed necessary by said Commission to carry out the objects of this act. And to enable said Commission to complete such surveys, examinations, and investigations the Secretary of War shall, when requested by said Commission, detail from the Engineer Corps of the Army such officers and men as may be necessary, and shall place in the charge and for the use of said Commission, such vessel or vessels, and such machinery and instruments, as may be under his control, and may be deemed necessary. And the Secretary of the Treasury shall, when requested by said commission, in like manner detail from the Coast and Geodetic Survey such officers and men as may be necessary, and shall place in the charge and for the use of said Commission such vessel, or vessels, and such machinery and instruments as may be under his control, and may be deemed necessary. And said Commission may, with the approval of the Secretary of War, employ such additional force and assistants, and provide, by purchase or otherwise, such vessels, or boats, and such instruments and means, as may be deemed necessary.

SEC. 4. It shall be the duty of said Commission to take into consideration and mature such plan, or plans, and estimates, as will correct, permanently locate, and deepen the channel and protect the banks of the Mississippi River; improve and give safety and ease to the navigation thereof; prevent destructive floods; promote and facilitate commerce, trade, and the postal service; and when so prepared and matured, to submit to the Secretary of War a full and detailed report of their proceedings and actions, and of such plans, with estimates of the cost thereof for the purposes aforesaid, to be by him transmitted to Congress: *Provided*, That the Commission shall report in full upon the practicability, feasibility, and probable cost of the various plans known as the jetty system, the levee system, and the outlet system, as well as upon others as they deem necessary.

SEC. 5. The said Commission may, prior to the completion of all the surveys and examinations contemplated by this act, prepare and submit to the Secretary of War plans, specifications, and estimates of costs for such immediate works as in the judgment of said Commission may constitute a part of the general system of works herein contemplated, to be by him transmitted to Congress.

SEC. 6. The Secretary of War may detail from the Engineer Corps of the Army of the United States an officer to act as secretary of said Commission.

SEC. 7. The Secretary of War is hereby authorized to expend the sum of $175,000, or so much thereof as may be necessary, for the payment of the salaries herein provided for, and of the necessary expenses incurred in the completion of such surveys as may now be progress, and of such additional surveys, examinations, and investigations as may be deemed necessary, reporting the plans and estimates, and the plans and specifications, and estimates contemplated by this act, as herein provided for; and said sum is hereby appropriated for said purposes out of any money in the Treasury not otherwise appropriated.

Approved June 28, 1879.

LIST OF AUTHORITIES.

POPULAR PUBLICATIONS.

THE MISSISSIPPI RIVER.

ADAMS, J. Q.—Letters during the negotiations at Ghent in 1815, respecting the navigation of the Mississippi by the British. Washington, 1822.

BACHE, F.—View of the Valley of the Mississippi. Philadelphia, 1834.

BELTRAMI, J. C.—Discovery of the Sources of the Mississippi. London, 1828.

BELTRAMI, J. C.—Defense of his Discovery of the Sources of the Mississippi. New York, 1825.

CORTHELL, E. L.—History of the Mississippi jetties.

ELLET, C.—The Mississippi and Ohio Rivers, containing plans for the protection of the delta from inundation. Philadelphia, 1853.

ELLET, C.—Physical Geography of the Valley of the Mississippi. Washington, 1851.

ELLIS.—Down the Mississippi. London, 1886. Cassels.

FALCONER, T.—Discovery of the Mississippi. London, 1844.

FLINT, T.—History and Geology of the Mississippi Valley. Two volumes in one. Cincinnati, 1832.

FLINT, T.—Recollections of the Last Ten Years Passed in the Valley of the Mississippi. Boston, 1826.

FOSTER, J. W.—The Mississippi Valley and its Physical Geography, including sketches of the topography, botany, climate, geology, and mineral resources, and of the progress of development in population and material wealth. Illustrated by maps and sections. Chicago, 1869.

FRENCH, B. F.—Historical collection of Louisiana, five volumes. New York, 1846–'53. Containing La Salle's expedition, Marquette's voyage, Hennepin's narrative, Mimbré's voyage down the river, etc.

GAYARRE, CHARLES.—History of Louisiana under Spanish Domination. New York, 1854: Redfield.

GAYARRE, CHARLES.—History of Louisiana under French Domination, 2 vols. New York, 1854: Redfield.

GREENE, F. V.—The Mississippi. New York, 1882: Scribner's Sons.

GRIFFIN, A. P. C.—Discovery of the Mississippi. New York, 1883: Barnes.

HART, A. M.—History of the Discovery of the Valley of the Mississippi. Saint Louis, 1852.

HENNEPIN, L.—A New Discovery of a Vast Country in America, extending above 4,000 miles, between New France and New Mexico, with a description of the great lakes, cataracts, rivers, plants, and animals. London, 1698.

HUTCHINS, THOMAS.—An Historical Narrative and Topographical Description of Louisiana and West Florida, comprising the River Mississippi with its principal branches and settlements, etc. By Thomas Hutchins, geographer to the United States. Philadelphia, 1784: Robert Aitken.

JAMES, J. A. and U. P.—James' River Guide—cities, towns, etc., on the navigable waters of the Mississippi Valley. Cincinnati, 1856.

MARBOIS, BARBE.—The History of Louisiana, particularly of the cession of that colony to the United States. Philadelphia, 1830: Carey & Lea.

The author was the official representative of France in the negotiations with the minister sent from the United States to purchase Louisiana.

Part II, 227–316 gives an interesting account of the cession and Bonaparte's conversations on that subject with his ministers.

MONETTE, J. W.—History of the Discovery and Settlement of the Mississippi Valley, 2 vols. New York, 1846.

PIKE, Z. M.—Account of Expeditions to the Sources of Mississippi, and to those of the Arkansas, Kansas, La Platte, and Pierre Jaune Rivers, 1805–'07. Philadelphia, 1810.

SCHOOLCRAFT, H. R.—Journal of Travels from Detroit through the Great Chain of Lakes to the Sources of the Mississippi in 1820. Albany, 1821.

SCHOOLCRAFT, H. R.—Narrative of an Expedition through the Upper Mississippi to Itasca Lake in 1832. New York, 1834.

SCHOOLCRAFT, H. R.—Summary Narrative of an Exploratory Expedition to the Sources of the Mississippi in 1820, resumed and completed by the discovery of its origin in Itasca Lake in 1832. Philadelphia, 1853.

SHEA, J. G.—Discovery and exploration of the Mississippi; narratives of Marquette, Allouez, Mimbré, Hennepin, and Douay. New York, 1852.

SHEA, J. G.—Early voyages on the Mississippi, by Cavelier, St. Cosme, La Sueur, Gravier, and Guignas. Albany, 1861.

THIERS, ADOLPHE.—The Mississippi Bubble. New York, 1859. W. A. Townsend & Co.

MISSOURI RIVER.

BRACKENRIDGE, H. M.—Voyage of the Mississippi in 1811. Pittsburgh, 1814.

GASS, P.—Journal of the Corps of Discovery, under Lewis and Clarke, from the mouth of the Missouri to the Pacific, 1804–'06. Pittsburgh, 1807.

LEWIS (M.) AND CLARKE (W.)—History of the Expedition to the Sources of the Missouri, 1804–'06. Prepared for the press by P. Allen. Philadelphia, 1814.

OFFICIAL DOCUMENTS.

The Senate and House documents relating to the Mississippi and its various tributaries, such as committee reports, executive documents transmitted from the War Department, and miscellaneous documents, are over five hundred in number. We have made a compilation of the same, but believing they will be of little service to the general public will omit them from this report.

But the two following publications by the War Department are of general interest:

HUMPHREYS (A. A.) & ABBOTT (H. L.)—Report upon the Physics and Hydraulics of the Mississippi. Upon the protection of the alluvial region against overflow and upon the deepening of the mouths. Based upon surveys and investigations made under the acts of Congress directing the topographical survey of the delta of the Mississippi River, with such investigations as might lead to determine the most practicable plan for securing it from inundation and the best mode of deepening the channels at the mouths of the river. Submitted to the Bureau of Topographical Engineers, War Department, 1861. Washington, 1876.

PARKE, JOHN G.—Laws of the United States relating to Public Works for the Improvement of Harbors and Rivers, from August 11, 1790, to August 14, 1876. Compiled in the office of Engineers, United States Army. Washington, 1877.

The following list of Senate and House Executive Documents, containing reports of Mississippi River Commission since organization in 1879, is also important:

	Senate number.	House number.
Forty-sixth Congress:		
Second session	196	58
Third session		95
Forty-seventh Congress:		
First session	159	
Do	10	
Do	10, part 2	
Second session	32	
Forty-eighth Congress:		
Second session		64
Forty-ninth Congress:		
First session		38
Do	Misc. 126	
Second session		25
Do		30
Do		92
Do		99
Do	88	66

ERRATA.

Page 138: For "Stella Ured" in list of names of boats read "Stella Wild".

Page 142, third paragraph: For "The luggers and small vessels" read "are" for "and".

Page 144, eleventh line from top: Should read "mileage of 17,232 miles".

Page 150: For "these railroads", at the beginning of second paragraph, read "Three railroads".

Page 156: After "Coal and coke", in table, read "bushels", instead of "tons".

Page 158: For value of miscellaneous, in table, read "8,565,880", instead of "9,548,157."

Page 160: Wherever "cane" appears on this page read "coal".

Page 162: "Total tons of freight transported between Memphis and the Gulf" should read "4,594,702".

Page 165: Add after (as head of table) "Cotton shipped by various steam-boat lines to New Orleans" the figures "1880-'81".

Page 166: Beginning of paragraph. "If the West has lost," read "river" for "West".

Page 167, foot note: For "15 cents" read "1.5 cents," and for "32 cents" read "3.2 cents".

Page 176, head lines to first table: Transpose headings.

Page 189, second paragraph below table: For "this system" read "these shipments".

Page 206, paragraph beginning with "Bayou Sara": Read "northern" for "western".

Page 239: For "By railroads, $463,080.54" read "$63,080.54".

Page 274, paragraph 18: For "1,950 tons" read "3,412½".

Page 279, "Greenville", paragraph 3: For "it" substitute "the town".

Page 288: After "shipments", first line, read "from New Orleans". Before "Gulf ports" and "Atlantic ports", at top of columns in table, read "To".
